Notes on Contributors

Raúl Alfonsín is the President of the Argentine Republic. Trained as a lawyer, he began his political career in 1950, but it was twice interrupted—in 1953 when he was imprisoned by the government of President Juan Perón and in 1976 after the military coup which overthrew President Isabel Perón. He was elected head of the Radical Party in July 1983 and successfully contested the presidential elections in December 1983.

Brian Hackland is currently Research Assistant for a British Member of Parliament. **Anne Murray-Hudson** is a post-graduate student at the Institute of Education, University of London. **Brian Wood** is a doctoral student at the London School of Economics and Political Science. All three authors are members of the Namibia Support Committee, London.

Cosmas Desmond lived in South Africa for twenty years, and during the 1960s undertook research on the effects of apartheid's 'resettlement' programme. He was banned and placed under house arrest from 1971–5, returning to England in 1978. From 1979–81 he was Director of the British Section of Amnesty International. His publications include *The Discarded People* (1971); *Christians or Capitalists? Religion and Politics in South Africa* (1978); *Limehill Revisited: A Case-Study of the Longer-Term Effects of Resettlement* (1978); *South African Unemployment: A Black Picture* (1978); and *Persecution East and West: Human Rights, Political Prisoners and Amnesty* (1983).

Lewis Taylor is a Lecturer in Latin American Politics at the University of York and former Research Officer at the Centre of Latin American Studies, University of Cambridge. His publications include *Maoism in the Andes: Sendero Luminoso and the Contemporary Guerrilla Movement in Peru* (1983) and *Bandits and Politics in Peru: Landlord and Peasant Violence in Hualgayoc 1900–30* (1985).

James Dunkerley is currently a Visiting Fellow at the Helen Kellogg Institute for International Studies, University of Notre Dame, Indiana. He is a former researcher for the Latin America Bureau, London. His publications include *The Long War: Dictatorship and Revolution in El Salvador* (1982) and *Rebellion in the Veins: Political Struggle in Bolivia, 1952–82* (1984).

Alan Dowty is Professor of Government and International Studies at the University of Notre Dame, Indiana. He is also Director of the Project on Contemporary Emigration Policies at the Twentieth Century Fund, New York. He is the author of *The New Serfdom: Contemporary Control of Emigration and Expulsion* (1986).

John C Griffin, Jr is an Instructor of International Policy Studies at the Monterey Institute of International Studies, California. He is a Doherty Fellow and a Fellow of the Institute for the Study of World Politics, and recently returned from a Fulbright Fellowship to South Korea. In August 1985, he lectured on counter-trade to ministers and representatives of several state organisations in the People's Republic of China. **William A Rouse, Jr** is at the University of New Orleans.

Guy Martin is Visiting Lecturer in the Diplomacy Training Programme at the University of Nairobi, Kenya, having previously held the appointment of Lecturer at the International Relations Institute of Cameroon of the University of Yaoundé (1976–84).

Jan K Black is a Research Associate Professor of Public Administration at the University of New Mexico, where she also teaches Political Science. She is a former Senior Research Scientist and Chairman of the Latin American Research Team in the Foreign Area Studies Division of American University, in Washington DC. Her publications include *United States Penetration of Brazil* (1977); *Latin America, Its Problems and Its Promise; A Multidisciplinary Introduction* (1984); and *The Dominican Republic: Politics and Development in an Unsovereign State* (1986).

Walden Bello is an Associate Fellow of the Institute for Policy Studies in Washington DC, and Co-Director of the Philippine Support Committee. He is the principal author of *Development Debacle: The World Bank in the Philippines* (1982), and co-author of *An American Lake: The Nuclear Peril in the Pacific* (1986).

Ervand Abrahamian is Professor of History at Baruch College, City University of New York.

Ruben Berrios is a specialist on Nicaragua, based in New York.

NOTES ON CONTRIBUTORS

Nicholas Mansergh is an Emeritus Professor of the University of Cambridge, where he is former Smuts Professor of Commonwealth History. He is a Fellow of St John's College, Cambridge.

Benjamin N Schiff is Associate Professor in the Department of Government, Oberlin College, Ohio.

Stephen Chan is a Lecturer in International Relations at the University of Zambia, Lusaka.

The Sole Spokesman

Jinnah, the Muslim League and the Demand for Pakistan

AYESHA JALAL

In 1940 the All-India Muslim League first voiced its demand for an independent state of Pakistan. Seven years later India was partitioned – in one of the most momentous and violent series of events in recent history. In this book Dr Jalal examines what happened in those intervening years, focusing in particular on the role of Mohammad Ali Jinnah, the charismatic head of the Muslim League.

'Jalal's monograph is an important contribution which no student of modern South Asia can ignore. The central theme is original, provocative, stimulating and in places quite exhilarating, and even if not proven, will no doubt stimulate a lively debate.'

Liberal Protectionism

The International Politics of Organized Textile Trade

VINOD K. AGGARWAL

What is the future of organized trade? Is the dangerous trend toward protectionism inevitable? This book uses an original theory to examine the evolution of international arrangements in trading regimes and investigates specifically the key case of the textile and apparel industry. The explanation of institutional change emphasizes the importance of international political and economic factors. Based on archival research and extensive interviews of the major negotiators, this study provides a detailed examination of trade conflict and cooperation among developed and less developed countries.

but to the sheer complexity of some of their recommendations. The Arndt report proposed a startling package, involving at least three central banks, to recycle petro-dollars—through deutschmarks or yen—to US bonds, to the IMF and, through the IMF, the on-lending of dollars to developing countries. In a way, the Arndt effort is the most ingenious and creative of the reports. Moreover, it is fair to say that it synthesised a great deal of thought which was then current about liquidity flows, particularly OPEC dollar liquidity, to the Third World. But much of that thought was convoluted precisely because there were obstacles that seemed immovable; the effort of thought was to snake around those obstacles; the more ingenious the circumvention, the more it seemed a solution was possible but, in real terms, the obstacles remained.

The two most impressive reports have been the Cairncross effort—not because of its impact on protectionism, but because of its professionalism, its obvious deep grounding in its subject, evidenced in its command and presentation of source material, and helped not a little by the specific nature of its subject and the character of its chairman—and the Akporode Clark report.

But, with the Akporode Clark report there are certain problems. In part, it seems a reflection of some of Ramphal's thought; the recommendations for a Third World secretariat echo the Secretary-General's speeches and interviews over preceding years.²² Such a secretariat, however, is not Akporode Clark's main theme. The report's main emphases are parallel to those of a study conducted at about the same time by two American academics.²³ Both the expert group and the two academics are convinced that their recommendations, which were warmly welcomed in North-Western quarters, would advance the cause of the South. Indeed, the South may (probably, will) have no choice but to adjust its negotiating policy in line with these recommendations, but it faces numerous dangers in doing so. The principal danger is the end to an identifiable 'South', the fragmentation of the Third World into competing and opportunistic mini-blocs. Certain Southern countries, probably those already in a relatively strong position, may benefit from the new approach, but Third World unity may disappear. Here, an irony intrudes: the expert group reports were conceived, either fully at the beginning, or gradually, after the reception of the first few, as implicating the Commonwealth in the quest for an NIEO—albeit in a fashion that could not alarm its Northern members. With Akporode Clark, the report most welcomed by the Northerners, the quest has been, at best, sub-divided, and, at worst, turned to the reduction and division of the questing body.

It is not the concept of incremental negotiations that is dangerous, but the concept of incrementalism that is not global. That is, nations are encouraged to

²² Shridath Ramphal, *One World to Share*, London, Hutchinson Benham, 1979, pp 180–201 and p 172.

²³ John W Sewell and I William Zartman, 'Global negotiations: path to the future or deadend street?', *Third World Quarterly* 6(2) (1984).

agencies, the World Bank and the IMF, whose collective mandate is promoting development and the expansion of world trade. The World Bank's lending to developing countries has actually fallen and there may even be a negative net transfer from developing countries to the Bank by the end of the decade. The IMF, whose prescriptions have become synonymous with recession and whose role has become simply to see that developing countries balance their budgets and service their debt, was actually set up to promote, not stifle, world trade. The SDR, which was meant to become the world's reserve asset, has declined rather than gained in importance and the IMF has been unable to exercise any effective surveillance over the most influential members of the international community—the industrial countries—because they have not had to have recourse to it for funds. The fundamental question remains, does the system need reform? If world trade is falling, protectionism is increasing, and the developing countries need more liquidity than is available in the global system, what has happened? Have the agencies which were meant to promote these objectives been corrupted or has the system developed a chronic malady?

Nineteen eighty-five began with great promise of an agenda of dialogue and reform. The April 1985 meetings of the IMF Interim Committee and the IMF/World Bank Development Committee made even the Santo Domingo meeting of Latin America debtors wait to see what would emerge. Donald Regan had described the purpose of the meeting as arriving at a common analysis of finance, debt and trade issues. Even though the April meetings were not themselves negotiations they could have created the modalities and the agenda for future negotiations between the North and South. They could have signalled a move toward the conference of creditors and debtors which the Latin Americans had been calling for since the first debtors' summit in Quito. What emerged from the April meetings was that none of the proposals put forward by the Third World through the Group of 24 (which would have meant a genuine alleviation of the problems they face) had been accepted: there would be no new allocation of Special Drawing Rights and the proposal to create an interest subsidy account in the IMF was rejected. However, the developing countries were urged to accept the creation of a Multilateral Investment Guarantee Agency (MIGA)¹ which would provide political risk insurance for foreign investors.

¹ See Ibrahim F I Shihata, 'The New proposals for establishing a Multilateral Investment Guarantee Agency', *Third World Quarterly* 7(2) April 1985, pp 365–89.

The refusal of the developing country proposals expressed the deep disagreement between the industrial countries and the developing world on whose needs the international economic system is meant to serve and what its objectives are. On that disagreement hinges the lack of recognition by the North of the need for reform of this system.

By May the Latin American leaders were performing their annual ritual of writing to the Western Economic Summit in Bonn. They had once more to reiterate: there had to be an acknowledgment of joint responsibility for the debt crisis and a recognition that their economies and societies were bleeding to death in trying to service their debts at the cost of growth and development. There had to be a meeting between governments as sovereign states to discuss this, not just meetings between debtors and bankers. This was a political problem which needed political solutions, only technical problems could be discussed with bankers.

The industrial countries replied to the Latin Americans' letter at the Tokyo meeting in June of the Group of 10: the international monetary system remained valid and required no major institutional change, therefore no conference to discuss reform was necessary. The finance ministers and central bank governors of the Group of 10² endorsed the report of the deputies who had been mandated after the Williamsburg Summit of 1983 to report on whether the international monetary system was working satisfactorily and whether President Mitterrand's proposal for a conference to discuss a return to a regime of fixed exchange rates was needed. At the Tokyo meeting the US pointed out that there was no shortage of world liquidity overall, the problem was that some countries did not have enough money. Countries could obtain reserves from financial markets provided they maintained their creditworthiness which was largely a function of their own domestic policies and performance. The terms on which reserves are supplied by the markets reflect the borrowers' own policies and performance and the preponderance of market-supplied international liquidity made it even more important to pursue sound domestic policies in order to safeguard creditworthiness. Improvements in the provision of international liquidity need not be sought through fundamental changes in the system. There was disagreement among the Group of 10 delegates as to whether a new allocation of SDRs was called for. Some pointed out that

² The original members of the G10 are Belgium, Britain, Canada, France, West Germany, Italy, Japan, The Netherlands, Sweden and the US. Switzerland became the eleventh member in 1984.

severe strains in liquidity conditions had built up in the system and were reflected in the decline of reserves in relation to imports and foreign debt and the rise of barter trade. But the other way of looking at these strains is that the difficulties are primarily an indication of the lack of creditworthiness of certain countries and were not related to a general shortage of liquidity. Doesn't the long-term growth of trade have to be supported by an expansion of international reserves? The answer to that was that international financial markets and official channels provided *adequate means of meeting this need and a new SDR allocation* would result in unnecessary and excessive liquidity creation.

The industrial countries were concerned to preserve the monetary character of the IMF and on no account to allow its role to be confused with that of a developed finance institution. The World Bank and the IMF should cooperate to ensure that their financing programmes were comprehensive and provided consistent policy advice. Why? Because this would enhance prospects for increasing private investment flows to developing countries. The conditionality of World Bank lending should not be weakened and it should be more active in encouraging external finance.

However, what had hurt industrial countries was the lack of coordination between their economies, which primarily meant that the US had been more than indifferent about the effects of its budget deficit and the strength of the dollar on other OECD economies. If that could be ironed out they would have the rest of the world well and truly by its throat.

Since the Group of 10 had declared the system to be healthy, the Group of 24 counter-reported on its maladies which were becoming chronic and harming developing countries most. The G24 report addressed the problems of debt and the transfer of resources to developing countries (which the G10 had significantly omitted from its consideration) because no meaningful improvement of the international monetary system is possible without their solution.

The IMF's surveillance, the G24 wrote, had so far been largely ineffective on major industrial countries resulting in asymmetry in the international adjustment process, the burden of which had fallen disproportionately on developing countries. Why couldn't the IMF effectively influence the policies of industrial countries in a manner that would be supportive of growth, particularly in the developing countries? For the developing countries the IMF was now meant to be exercising 'enhanced surveillance', which was further evidence of

creditors' unwillingness to restore normal access to external financing despite significant adjustment efforts.

The creation and management of liquidity in the past decade had been unsatisfactory. Its supply had been uneven and grossly inadequate for developing countries. Commercial bank lending was unreliable as a source of liquidity as was evident by its recent contraction. The conditions of supply of international liquidity and its distribution were more important than the world aggregate reserve holdings.

The G24 called for an annual allocation of no less than SDR 15 billion to help to relieve the stringency in the reserve position of a large number of developing countries, to promote recovery without being inflationary, and to improve the balance between conditional and unconditional liquidity. Inadequate financing with high conditionality would correct neither transitory nor persistent payments imbalances nor would it lead to a correction of persistent payments imbalances.

The developing countries feared that coordination between the Bank and Fund would lead to cross-conditionality and become a means of exerting concerted pressure on the borrowing countries.

The resource base of multilateral financial institutions had to be increased and their total votes raised to 50 per cent from the 38 per cent they exercised at present. The G24 felt that an effective reform of the international monetary and financial system required the convening of an international conference.

Despite the fact that it has become clear how divergent are the views of the North and South on the subject of monetary reform are, where there is a willingness to hope we can always go on waiting for the outcome of yet another meeting, of the recommendations of a group of eminent persons, or for the initiative of the Treasury Secretary of the world's most powerful economy. And so it came to pass that all the bankers gathered for the annual meeting of the World Bank and the IMF in Seoul waited breathlessly for the 'Baker Plan'. How much of a breakthrough that would be had been presaged by the events and statements of the major industrial countries earlier in the year.

Baker's plan is that commercial banks should make new loans to middle-income developing countries of \$20 billion over the next three years. He also called for a 50 per cent increase in lending by the World Bank and the Inter-American Development Bank to produce total flows from these institutions of \$9 billion over the period 1986-88. But the debtors had to adopt comprehensive macroeconomic structural adjustment policies to promote growth and balance-of-payments

adjustments and to reduce inflation. The IMF would continue to play a central role complemented by increased and more effective structural adjustment lending by the major development banks. The increased lending by commercial banks would be made in support of the adoption by principal debtors of market-orientated policies for growth. There was more than one report from Seoul of US bankers saying that 'pariah nations such as Peru', who have dared to say they will decide what level of debt service they can afford, should be cut off from both official and private finance. Obviously, economic sovereignty for developing countries is no part of the new deal. Baker's 'Programme for Sustained Growth' did not, he emphasised, depart from the case-by-case debt strategy adopted three years ago. This approach 'had served us well, we would continue to follow it'. Baker wanted to see the banking community make a pledge to provide these amounts of new lending. Bankers meeting under the aegis of the Institute of International Finance broadly endorsed the Baker initiative.

But what lending effort are the banks being asked to make? They are expected to make a mere 2.5 to 3 per cent annual increase in their outstanding loans and then only to those debtors who persevere with adjustment measures as opposed to the 6 per cent increase which the Bank, the Fund and even the bankers themselves feel is the minimum required by developing country debtors. What the developing countries will get in return are even longer adjustment programmes and 'enhanced surveillance' by the Fund.

Sub-Saharan Africa is not about to attain creditworthiness, in the market sense of the term, perhaps not even until the end of this century. Of course, the market may be interested in investing there on terms which are not to the benefit of the majority of the people in the host country. Part of the campaign for developing countries to 'open up their economies' is to urge, or not too subtly coerce, them to place less restrictions on foreign private investment and consequently care less about the social and economic effects of that investment. What the industrial countries have signalled is, 'The system works just fine because it works so well for us.' The developing countries have to understand that signal for what it is—no dialogue, no reform. As Mexico picks up the pieces of devastation after its earthquake and Tanzania worries about how many month's worth of imports it has reserves for, Alan García's stance seems more like commonsense than bravado. If what we fear most is the loss of a credit rating which we cannot hope to achieve even at the cost of the welfare of our people,

shouldn't we be beyond fearing the system. Isn't it time for a reassessment which asks—why are we playing the game by the rules when the rules are such that we always lose? If there isn't going to be a process by which the rules can be changed isn't it time that we set our own rules? After all, what does a 'pariah state' stand to lose except the illusion of credit?

Mahathir Mohamad

Datuk Seri Dr Mahathir Mohamad is the Prime Minister of Malaysia and the Minister of Defence. He was born on 20 December 1925, in Alor Star, the capital of the state of Kedah, where he received his early education. He began medical studies in 1947, at the former University of Malaya, in Singapore (now the University of Singapore).

He became active in politics in 1945, eventually becoming a member of the Supreme Council of the United Malay National Organisation (UMNO) from 1965–9. He entered Parliament as an Alliance candidate from 1964–9 and, after a brief term of office as a Senator in 1973, was re-elected to Parliament as a National Front candidate, in 1974. In the same year, he was appointed Minister of Education in the first National Front Government, and held successive posts in education. From 1976–81 he was deputy Prime Minister, and from 1978–81, Minister of Trade and Industry. In July 1981, he became the fourth Prime Minister of Malaysia, and the Minister of Defence.

He is the author of The Malay Dilemma (1969).

Altaf Gauhar interviewed Mahathir Mohamad in Kuala Lumpur in August 1985.

AG: *The question to which we are all looking for answers is how to bring about change, which is really a problem of leadership. We want to know how to initiate the process of social change to create an environment in which people have access to opportunities and to develop their potential. In your Trinity College lecture in April 1985, you said that the world is divided into three types of societies: ultra-stable, ultra-unstable, and societies transfixed in conditions of potential instability. You then went on to describe the tasks of leaders in dealing with the problem of change in these three societies. Can you elaborate on these ideas, and how they apply to the Third World?*

MAHATHIR: Quite obviously, the most desirable society is a stable society and the task of leadership is to strive for that. This involves trade-offs and compromise. One of the things we often say in Malaysia is that the country is doing well if everyone is unhappy. It is a contradiction in terms but it follows from the fact that we have three different communities in Malaysia. Fundamentally, our problem is

that of racial animosity. If we satisfy just one community 100 per cent, that community will be happy but the other two will be unhappy. So what we are struggling to do is to see that everyone gets something but no one gets everything. If you asked people in Malaysia whether they were happy, you would find that the Malays are not happy, the Chinese are not happy and the Indians are not happy. To us this is fine because it shows that the government has been fair to all, and that leads to stability. It is a very strange approach but there is no way we can satisfy everybody. That is something that we have to accept. So we don't try to satisfy everybody and that has resulted in a degree of stability. The task of leadership is to get a balance, and to maintain that. Where unstable societies have problems is when the attempt is made to completely satisfy one society, one group, as in Lebanon and Northern Ireland. Or in certain African countries, where tribalism is manifest; if you try to satisfy one tribe, you will have a lot of other dissatisfied tribes. That is what happened to Milton Obote. But if we accept the fact that we cannot satisfy everyone and we tell the people that sorry, we are not going to satisfy all, we eventually get them to accept the situation.

AG: *Prime Minister, this is a very special definition of stability where everyone is equally unhappy; the examples you give are really extreme examples, and not ones of successful societies. I was thinking of a level of stability that exists, say, in most societies in Europe, the US or Canada, where everybody is not equally unhappy. Everyone has problems but also a sense of freedom and participation. They too have disparities but there is no sense of deprivation. Malaysia itself is an exceptional case that has achieved a level of stability. I personally do not think that it is a level of equal unhappiness. I think it is a level of a great deal of satisfaction achieved in a multi-racial society. Moreover, you have solved the greatest problem which no other Muslim country has solved: the problem of succession and transfer of power. What I was hoping was that you could look at the problem in the Third World as a whole, whether you think that the system of gradual reform is a possibility or whether the only possibility is that of fundamental change?*

AHATHIR: Frankly, I do not believe very much in systems or the devising of a system as an approach to solving different problems. It is the attitude of a community that counts most. We have been devising through the ages different systems concerned with absolute power over life and death. At the very beginning these evolved into the feudal system. Then they changed into democratic systems. We have all kinds of varieties of democracy. We have even gone so far as to have the dictatorship of the proletariat as you find in the Soviet Union or in China, where the workers or peasants are supposed to be supreme. These are changes in systems arising out of the perception that there is an inherent goodness in a certain system. But democracy does not necessarily make people any happier. Even in a democratic society there must be limitations to one's freedom. But do you accept that limitation or not? And then we come back to people's basic attitudes. If you accept a situation, you can be happy.

The problem in trying to change systems is that you can keep on changing a system but basically you are dissatisfied with whatever becomes established. You want to go against the establishment. Why is there so much terrorism now? Because the annual blood-letting—the twenty-five years blood-letting—has been stopped and people must go around killing. Had these people gone to war I think they would be happier because they have this urge to be violent. If you stop this outlet it results in other things. It is not the system that is at fault. I don't see what's wrong with the system in Europe where everybody has his rights, and yet we have terrorism in Europe, and dissatisfaction and unhappiness.

AG: *Prime Minister, you mention terrorism, you mention the acceptance of limitations, that if people accepted these, there would be a kind of stable arrangement. When people move out of systems which have been stabilised, which people had accepted, deep down human nature was revolting against the fact that the limitations—whether or not you call them limitations of law—were not yet universal. It is when the laws themselves, i.e. the limitations themselves, are iniquitous that you get this problem of reform and revolution. Iran had a revolution because the Shah's laws, which on paper appeared*

universally applicable, were in fact not so, and the people resented this. Iran was a very stable society in 1977-8. No specialist forecast that the Shah's regime would be toppled. Terrorism in Lebanon exists because the laws are iniquitous. A young girl who goes and kills herself on a suicide mission is not satisfying the blood-letting urge. So we have to be very careful about this whole problem. What is happening in the Third World today, what is happening in my own country Pakistan, for example, which is under military rule, is the perpetuation of iniquitous systems and laws. If you are a military officer you belong to a different world; if you are not a military officer, you belong to a completely subservient world. Why is it that out of 126 Third World countries there are only four or five countries, including Malaysia, that have established a system of democratic participation?

MAHATHIR: Different countries are at different stages of development. In terms of culture they are not the same. Their thinking and values are different. So you cannot apply the values of one society to another. But there is a threshold beyond which you must not go. Society will tolerate certain iniquities but if it becomes too obvious as in the case of the Shah, then there is a backlash. So the important thing is to assess what the threshold is and not to go beyond that. Some people do not seem to realise that they have gone past the threshold. Even we in Malaysia have been talking about it. To warn people not to take things for granted. But some people can be completely blind to the threshold. The Shah was completely blind because he was fed all the wrong information. He felt he was popular. Either he didn't realise his unpopularity or he felt at least that he could cope. If you can recognise the threshold and avoid going beyond it, societies can remain stable. It requires in some cases the strength of tradition and in some, political skill. Take the developing countries. Many of them suddenly became independent, without any preparation, as compared with Europe, which had been through a process lasting hundreds of years. You have these countries where people were denied sovereignty and suddenly they acquired full authority. It is very destabilising for a person. Even in Malaysia, in the state of Sabah, for example, a frontier state, where people who had never had

authority were suddenly given authority. And they thought that with this authority they could use the state's money. They thought they were above the law. We've tried to tell them: 'Look, you're not above the law. If you do something wrong, you will be apprehended.' But they feel that 'I am a Minister, therefore, I can do what I like'. I had a number of them complain to me: 'I'm an MP and the Customs had the cheek to examine my things'. This is their attitude. So it takes time for them to change. This is a major part of the problem of Africa especially, where from having nothing, they were suddenly pushed into a situation where they had absolute power. That becomes very destabilising.

We, on the other hand, gained independence by a gradual process of negotiations. And most of Malaysia was never really a colony. Kedah, for example, was under British rule only from 1911, and became independent in 1957. So it was 'under' the British for less than fifty years. Before that, we were ruling ourselves. Even during the British period, when they practised 'indirect rule' we were still ruling ourselves internally. So it was much easier for us to cope. But in many countries where the district officers, the district commissioners and the district residents were all foreigners, suddenly you find somebody who was maybe a sergeant in the army becoming the head of government. How is he going to deal with the affairs of state? I don't think he can.

AG: *You observed that there are fortuitous circumstances that can help. It could be political skill, a charismatic leader or a combination of circumstances. You yourself have been part of change as well as an agent of change. In 1957, you started with an extremely complex situation. What were the factors that helped you evolve the national consensus that has produced a relatively stable society?*

MAHATHIR: Well, having been under the Japanese for several years we began to feel that if the Japanese could replace the British, so could we. The aura of mystery around the Europeans disappeared and made us feel more equal to the task of running the country ourselves. Next we did have people experienced in government. Tunku Abdul Rahman, our first Prime Minister, was a public prosecutor at that time, experienced in law. It was nothing new for him to be

hobnobbing with European officials in the country, and they were no mystery to him. So he was able to speak to them on equal terms, at least on a man-to-man basis. He saw it was possible to carry out the struggle without resort to arms and the consequent claims that would come from people who had made sacrifices. So we had nobody who could say: 'I made the greatest sacrifices, so I must be given a position'.

In Malaysia we were very fortunate, and we learned from this experience that stability is an important commodity for everybody. After independence, we did not become ultra-nationalist; we did not nationalise foreign property, for example. We eventually acquired such property but we paid for it. Although there was nationalism, it was not of the extreme brand, probably because we did not have to fight. The British didn't resist that much. But in other places where the British resisted and they had to fight, then of course claims were made by people on the basis of their sacrifices. Whether they were qualified to rule did not really matter to them. Since they fought, and risked their lives they wanted a place for themselves in the new order.

AG: *How were Malaysia's three ethnic groups—two of which are not really indigenous—able to arrive at a minimum consensus framework? Was that also the result of the experience of the Japanese occupation, or was it leadership in the three groups?*

MAHATHIR: No, not experience during the Japanese occupation. Partly it was the British who made it very clear that we would not get independence if there was going to be bloodshed in the Indonesian style. So our approach was to have an understanding between the races that we would work together. Of course, there were people who opposed this but the majority agreed to forget, for the time being, their own claims in the greater national interest. And that led to the formation of the Alliance Party.

AG: *That was precisely the attitude the British took in the 1940s toward India. They said: 'Look, you sort out your differences. We don't want partition; if you form a coalition it would be easier'. But the Indians could not evolve that consensus and agreed on the partition of the country. What*

were the special factors which facilitated the evolution of a consensus in Malaysia?

IAHATHIR: I think next to the British, I would put it to the personality of the Tunku. He was not a Gandhi, but he had the respect of all three communities. Moreover, his position was so strong that he was able to carry his opinion through. There were a lot of extremists among all the races but they could not muster enough support for themselves. The Tunku was too powerful and he insisted that we should work together. And he proved to be right. In 1955 when we had elections in Kuala Lumpur, the Alliance under Tunku won for the first time and swept everybody out. From then onwards nobody voted against him. The idea of independence even under those terms was much more attractive than continuing to be part of the British Empire with no independence, even though the British called the Malays 'the indigenous people' or 'sons of the soil'. Tunku's personality carried us through. Now, of course, nobody talks about this philosophy, but I think basically the Alliance philosophy is still very much BN's (Barisan Nasional) philosophy and the Tunku's philosophy. Even I, who at one time rebelled against him, accepted that his approach was right. Where I disagreed with him was when he decided that all the Malays wanted was to become government servants and all the Chinese wanted was to become businessmen. I disputed that. I felt the Chinese and the Malays both wanted to become government servants and businessmen as well. He said there was no conflict and there was harmony. I said there was no harmony. This is what I wrote in the *Malay Dilemma* but Tunku would not hear it. He was by then so far removed that he could not hear the rumblings on the ground. I did not want the Malays to have everything. I was for sharing provided it was equitable sharing. So we evolved the New Economic Policy, the thrust of which was to eradicate poverty regardless of race and to redistribute wealth on a more equitable basis between the different races.

AG: *Have these results been achieved?*

IAHATHIR: I think we've made considerable progress. It was a very difficult situation. The Malays had 1 per cent of corporate

ownership, the Chinese 40 per cent and we had to work our way up.

AG: *Is it true that the result of the NEP is a Malay society that is dominated by a handful of retired officers and politicians who had monopolised most company directorships?*

MAHATHIR: That is the conventional view. But if you make a real study, the NEP is not just a question of company ownership. It also provides opportunities for education. We have sent abroad at any one time roughly 20,000 Malays to study. Even if it were assumed that only the rich Malays get this benefit then I would be happy. If there are 20,000 such Malay children of rich families, then we must have succeeded in enriching many Malays, not just a few! But, in fact, they were children of poor families from kampungs (villages). We're bringing up the poor. There are literally hundreds of thousands of people who've benefited, not just a few rich Malays. The Malay man who has opened a small retail shop in the village is a beneficiary. You can't expect everyone to become a multi-millionaire.

AG: *Do you feel the NEP targets will be largely achieved by 1990?*

MAHATHIR: Maybe a little later, but we will achieve the targets. The fact that we've achieved an 18 per cent Malay share in corporate wealth is a remarkable figure.

AG: *Do you feel that the consensus which Malaysia has evolved will hold and all three communities will come to think of themselves as Malaysians first? Do you think this likely, say, in the next ten years?*

MAHATHIR: Not in the next ten years. It will take time, but eventually it is bound to happen. Already, for example, we see in the schools that often Chinese students speak better Malay and achieve better exam results, even in Islamic Studies, than Malay boys. The problem is how do we deal with the situation because we don't have the excuse of the Malay-non-Malay now. The people are beginning to come together.

AG: *Is this also true of the Indian community?*

MAHATHIR: Yes, the Indian community can speak Malay very well. You see Indian news readers on TV; one Bengali news reader speaks better Malay than some Malays. A lot of them speak Malay and all the TV interviews are now in Malay.

AG: *Are you concerned about growing complaints and frustrations among the Chinese and the Indian community?*

MAHATHIR: Well, let's take more homogenous societies such as Korea, Taiwan or Singapore, where there are similar frustrations or complaints though not for the same things. In Singapore they should be very happy. The Chinese are dominant, but many Chinese are not happy. So happiness is not caused by one or two factors. I would be very amazed to find a country where everybody is content. Somewhere along the way they will be unhappy with the government. We accept that situation.

AG: *Does the present split in the Malay Chinese Association (MCA) pose a threat to the coalition government?*

MAHATHIR: The problem is at the leadership level, but all of them, all the factions, support the government and the coalition party. Even in Sabah where the new government is not a member of the BN, they have always said they support the BN. Everybody wants to be with the government in power.

AG: *How serious is the leadership problem in the MCA?*

MAHATHIR: It is serious in the sense that they cannot settle who should be their leader. Therefore there will be a problem of running the party. At the moment the party can't function because they cannot agree.

AG: *But you still have them in the Cabinet?*

MAHATHIR: They are there as individuals, because they have a contribution to make.

AG: *So they will stay in the Cabinet whether they solve the problem or not?*

MAHATHIR: That depends on whether the person who is the present leader stays on as the leader.

AG: *We all say that the North-South dialogue has stalled. The truth is that it never started. What do you see as the main weaknesses in the Third World that have impeded progress towards a new International Economic Order?*

MAHATHIR: It is difficult to expect other people to solve our problems. Basically the problem is ours. The North sees no reason why they should solve our problems. We are not negotiating with the North from a position of strength, not even as equals. We negotiate from a very weak position. We demand restructuring but in fact are asking for aid. We can't succeed

because they have the strength. The question is whether we are able to consolidate ourselves, and draw some strength from each other. I think we can. Malaysia had problems, but we were very cool and detached. We took a very simple step: we just said we would not buy British. We would buy British last. This did not destroy the British economy, but it did affect certain individuals who are sufficiently influential to be able to pull strings in the government. As a result, we were in a position to threaten them with something we could withhold. They had something to give us, we had something to give them. This is how we could negotiate and solve the problem.

I believe that every country, however small, is able to do something like this. The question is to assess one's strength and use it. Of course, when countries work together they augment their bargaining position. But to expect all the developing countries to work together is difficult. It is better to attempt this at the regional level. ASEAN is the world's biggest supplier of tin and rubber. If we used that position to negotiate with the Americans, I think we would succeed. That is why we have promoted the Association of Tin Producers as a desperate effort to try and boost the tin market. Cooperation is also needed in marketing and research. Research may discover more uses for tin. Then we can expand the market. There is much we can do to strengthen ourselves. Once we are strong, the North will accept what we say.

AG: *Do you think the Third World should repudiate its external debt, as Fidel Castro suggests, or at least say, as Peru has said, that we will give no more than 10 per cent of export earnings toward debt repayments?*

MAHATHIR: If you are strong enough to withstand the pressures, by all means. Speaking as a doctor, if you had diabetes and your general constitution was not good and I chopped off your leg, you would die without the leg. When you say you won't pay your debt, you must be strong enough to withstand the counter-measures the creditors are bound to take. They will deprive you of everything, and you will perish together with your debt. But if you are strong enough to say: 'Look, I am not going to pay until I can afford to pay', then, of course,

they will have to accept. You may need to restructure or postpone, but you must be prepared to pay; otherwise you will not be able to withstand the actions that they will take against you. Malaysia is very careful on this issue but, of course, we have the means to pay. It is also important for lenders to understand that if they destroy the debtors, they will lose everything. In a way, the lenders are in a fix. As they say, if you lend a billion dollars to a man, you are at his mercy. In fact, the lenders are now at the mercy of the debtor countries. We should be prepared to negotiate on that basis.

AG: *On Malaysia's dealings with Britain, your 'Buy British Last' policy obviously worked. Have Malaysia's problems with Britain been resolved?*

IAHATHIR: Let us say that we understand each other better. Mrs Thatcher understands the way we work here, and we understand the way she works, so it is possible to negotiate and get agreements. On the question of landing rights, for example, there was some procrastination but we got what we wanted without applying undue pressure. The secret of the technique is that you should know your own strength. If you go around threatening people and people call your bluff you will find yourself in a ridiculous position.

AG: *Can you identify areas of strength where the Third World could apply pressure to achieve its objective?*

IAHATHIR: Third World markets is one. The strategic location of developing countries is another and the Third World has a definite leverage in the UN provided we do not use it indiscriminately and brashly. We should use it sparingly and well. The fact is that the North cannot lose interest in the South. They will always need some of our resources. Japan, for example, will need raw materials and other goods from the South. And if the South can become stable internally, then we can use this leverage to good effect. If you are in a state of flux all the time, not knowing your direction, you lose your strength. If we can build regional organisations which will work as a unit, then we can increase our leverage by that much. There is, I think, quite a lot of things that the South can do.

AG: *In a recent speech in Hong Kong you said that the centre of*

gravity has moved from the North Atlantic to the Pacific, and you saw the Pacific community acting as an engine of growth well into the twenty-first century. However, you were worried about the economic cold war between the US and Japan which could seriously damage the economies of many developing countries in the region. How can such damage be avoided?

MAHATHIR: What we can do at the moment—beyond trying to persuade people to be sensible about the problems—is very limited. Japan must understand that it cannot shut its eyes to our situation. We have a vested interest in continued friendship between Japan and the US. They must open up to each other. Japan must understand that the prosperity of its customers is important to its economy. If the customers are not prosperous, they will not be able to buy what Japan produces. When Toyota invests in the US, we are left out. And when the US invests in Japan, we are left out again. What we want is that whatever solution they work out for their problems should include us. As an illustrative example, if Japan wants to export cars to the US, it could build the cars in Malaysia and sell them to the US. Japan will make its profit. The US will get cheaper cars, and we will get a small portion of that business as the site for manufacturing the cars. In return, we will buy Japanese and American goods.

AG: *What do the Japanese say to this?*

MAHATHIR: Well, the Japanese take a long time to react, because their negotiating procedure is very elaborate. But we kept on repeating this *ad nauseum*, and I think they are beginning to appreciate the need to do this.

AG: *But there is no let-up in direct Japanese investments in Europe and North America*

MAHATHIR: That is their immediate reaction to the threat of the US market closing on them. They will invest. But even if we get a portion of that investment later on, I think it will be good enough for us.

AG: *What was the North American response?*

MAHATHIR: When you talk to the Japanese, they listen though they may not agree. But when you talk to the Americans, they immediately disagree. They have no inhibitions about

expressing their feelings. Sometimes it becomes very difficult to get through to the Americans. Fortunately the present leaders of America include people like Mr Shultz, who is a different kind of political animal altogether. Schultz is one person who will listen, and he will accept the views of countries like Malaysia. It is because of him we have new landing rights. It would be useful if participation of all countries could be ensured. Certainly the South must have a share in the common wealth that is generated.

AG: *Given the current state of tension, indeed confrontation, between the US and the USSR, are there any grounds for optimism about the November 1985 meeting between President Reagan and General Secretary Gorbachev?*

MAHATHIR: Well, in the first place, I would say that any meeting between the two is a happy sign. The more talks they have, whether they agree or not, the better it is. It is when they do not talk that we are in trouble. Then each will be doing his own thing, and will not know what is going to happen. Secondly, the arms race is, of course, going to be costly. Inventing a new weapon will not solve any problem. With Star Wars, one side will invent one weapon, the other side will invent another weapon as a counter-measure. Then the arms race will escalate, absorbing larger and larger quantities of money, leaving nothing for anything else. This is becoming absurd. They are inventing weapons to fight weapons. The whole Star Wars programme is illogical because eventually you still have to come down and fight on the ground. Basically, it is the rifle that will settle the issue, not what is going on out in space. What will go on in outer space is a great waste of money. But of course, somebody has convinced the Americans that they should do this, and I think the Soviet Union will react. This will go on *ad infinitum*, and each time the cost will escalate.

AG: *Third World leaders have not expressed themselves forcefully on this question of the arms race. The only thing has been the recent five-continent initiative. Should more leaders support this?*

MAHATHIR: I suppose so, but I don't know whether this will do any good. Obviously, no one likes this arms race. I think the more important thing is for scientists to go against it and not

work towards it. After all, it is they who invent all these things. What we need are simple weapons for defence. But the arms race is creating needs which were not there.

AG: *The developing countries themselves are engaged in a mad race to accumulate sophisticated arms. The Middle East is the most heavily armed area in the world after the US and USSR. There is no realisation that they are arming themselves only by depriving their people of education, health care, and other basic amenities.*

MAHATHIR: As far as I am concerned, we would not like to see this race in the Third World countries. We cannot afford it. But the wonder is, how in Lebanon, for example, they can obtain weapons which are so costly that even Malaysia cannot afford them. Certain missiles cost as much as several million dollars. Where is the money coming from? We suspect that other people are testing their weapons in Lebanon. Perhaps these arms are provided, not for profit but for purposes of testing their weapons? This is real-life testing.

AG: *Could ASEAN serve as a model of South-South cooperation for the Third World?*

MAHATHIR: It is a model in the sense that it is one of the regional organisations that has worked. Not 100 per cent. Not as expected. The expectation, especially on the part of outsiders, was misplaced. ASEAN did not come into being because of the need to have a common market. ASEAN was formed because of a need to solve problems among neighbours. We had problems with Indonesia and the Philippines and we had to resolve these problems. We had to meet. Initially we formed ASA and later ASEAN. From that point of view, it is a resounding success. Politically, ASEAN has been a great success. Economically, there is much to be desired. There are a lot of areas where we have not succeeded at all. ASEAN is not perfect but it is a worthwhile model to try.

AG: *If ASEAN has been so successful politically why have the leaders not been able to meet for eight years?*

MAHATHIR: That is not quite true because we do meet individually. We have not had a summit because we don't want to have a summit for the sake of having a summit. We will have a summit if there is something substantial to discuss and if the

preliminary work has been done. Then we will go and meet and give our approval there.

AG: *Was it not the dispute between Malaysia and the Philippines that prevented such a meeting?*

MAHATHIR: Well, there is this problem, of course, between the Philippines and ourselves. But every time we have a new Prime Minister the custom is to visit the others. I have visited the Prime Ministers of Thailand, Singapore and Indonesia. Several times they have visited me. I think we are really in close personal contact. There is no problem for me to meet them or for them to meet me.

AG: *But with the Philippines there is this distance?*

MAHATHIR: The problem with the Philippines is Malaysia's problem. So, as a group we still function. And when there is a need to meet, we will meet.

AG: *What are the prospects of resolving this problem? Does it have to await the exit of President Marcos?*

MAHATHIR: It is difficult to say because much depends on them. As far as Malaysia is concerned, all that is needed is for the Philippines to issue a decree to repudiate their previous claims. And they can do it under their present system.

AG: *The other major problem is Kampuchea. Malaysia has proposed 'proximity talks' between the parties involved in the conflict. What would happen if the status quo continued?*

MAHATHIR: If nothing is done the result will be the occupation of Kampuchea by the Vietnamese, and, we suspect, the gradual assimilation by the Vietnamese of the Kampuchians. It is their way of making permanent their domination of the area. So we would like to solve the problem. If we cannot succeed one way, there are other ways.

AG: *But is Malaysia not in a strong position vis-à-vis Vietnam to persuade them to seek peace?*

MAHATHIR: Not strong enough to be able to tell them that they should accept some of the solutions that we propose.

AG: *Do you think it is in Vietnam's interest to let the status quo continue?*

MAHATHIR: We suspect it is in their interest to continue the status quo. They have achieved what they want, but the cost may prove to be very great.

Inga Thorsson

Inga Thorsson is an Under-Secretary of State at the Swedish Ministry of Foreign Affairs and Chairman of the Swedish Disarmament Delegation to the UN (1973–82). She was the President of the First Non-Proliferation Treaty (NPT) Review Conference in Geneva (1976); Chairman of the UN General Assembly Ad Hoc Committee on the strengthening of the role of the UN in the field of disarmament; and Chairman of the UN Group of Government Experts on the Relationship between Disarmament and Development (1978–81). In 1983 she was appointed by the Swedish Government to undertake a study of national aspects of the relationship between disarmament and development.

Raana Gauhar interviewed Inga Thorsson in Stockholm in September, 1985.

RG: *You have devoted fifty years of your life to the peace movement which must give you a unique perspective on the problems of peace and development. It seems important to explore that perspective at a time when the backdrop to any disarmament interview is very discouraging: close to \$1 trillion are being spent on arms, and most arms control regimes and arms controls treaties are being eroded by evasion or violation. You were the president of the First Review Conference of the Nuclear Proliferation Treaty in 1975, do you consider the NPT regime a success and if it has been less than successful, where would you lay the blame for failure? What is your criterion of success because the US Arms Control and Disarmament Agency has said that so long as nobody withdraws or threatens to withdraw from it, it can be deemed a success?*

THORSSON: I can tell you from experience that the First Review Conference in May 1975 was a very difficult one. There were tensions and controversies of various kinds among the participating delegations; between the nuclear weapon states and the non-nuclear weapon states, between neutral and members of military alliances, and, finally, between developing countries and industrialised countries. This, of course, was due to the feeling among several advanced developing countries that they had been denied the

possibility of nuclear power for energy production. At that stage the problems were divided equally between the issues of the transfer of nuclear power and the technology of nuclear power and the lack of progress in the field of nuclear disarmament in the working groups which had been entrusted with the task of preparing the final document. The working groups found progress very difficult and at quite an early stage some leading personalities and some delegations from the more progressive countries realised that there was a very great danger that the conference might collapse. So they discussed with me the possibility of trying to save it and in the final week of the conference we agreed that, with their support, I should prepare my own presidential draft of the final document. I put together all the passages in their draft where there had been some measure of agreement.

The conference was due to end on Friday and on Thursday at around lunch time, I went into the drafting committee and interrupted its work and said that there was no point in their continuing, as there had been no progress and they would not finish by tomorrow. If we did not make an extraordinary effort there would be no final document. I called an extraordinary session of the whole conference of the plenary that afternoon and submitted my presidential draft. I then assembled a small editorial committee of the various parties concerned, saying that although I would accept reasonable editorial amendments, there could be no change in substance in the document because once we began making changes it would open the door again for all sorts of problems.

So, throughout Thursday night and Friday morning there were consultations and discussions in all the various groups (the Western countries, the neutrals, the Eastern bloc, the developing and the non-aligned) on the draft to see if they were ready to accept it. One by one they came to me and said that although they found the situation very difficult they would accept the draft with the provision that they would be allowed to make 'interpretative statements' after the adoption of the document by consensus. So instead of ending the last session at 3 p.m. on that Friday we did so two hours later when all were prepared to give ground and accept it. The

important thing about that document was that not only did it contain a review of the past five years. This was our error in 1980 (at the Second Review Conference)—there was no final document; there were no guidelines for the future. In 1995 we shall be approaching a very important stage in the history of the NPT for it is in force for 25 years and if one review conference after the other fails in providing guidelines for the time further ahead, there could be a very dangerous situation.

We fought against nuclear weapons in Sweden in the late 1950s and early 1960s when I was Chairman of the Social Democratic Women's Federation which, at its congress, unanimously rejected having nuclear weapons for the defence of Sweden. I became one of the leaders of a campaign against nuclear weapons which triumphed in 1968 when Sweden's parliament decided that nuclear weapons should not be produced and should not be introduced in Swedish defence preparations.

RG: *I thought that part of the reason that the Second Review Conference in 1980 ended without a declaration was that the neutral and non-aligned states wanted to underscore their dissatisfaction with the lack of progress on nuclear disarmament rather than adopt a compromise position as they had done earlier?*

THORSSON: Yes, the difference as I see it between the 1975 Conference and the 1980 Review Conference was that in 1980 there was much more emphasis on the lack of progress in nuclear disarmament than on the acquisition of nuclear power. The bitterness was felt very deeply in the working group which dealt with Article 6 and the comprehensive nuclear test ban. At the Second Review Conference I was chairperson of the Swedish delegation. What should have been emphasised much more is Article 6 of the NPT. What Article 6 says is that *each* state party to the treaty undertakes to negotiate in good faith to reach an early cessation of the nuclear arms race and then to proceed to nuclear disarmament. So it is not the nuclear weapon states it is *every* state party to the treaty which is under an obligation to negotiate a cessation of the nuclear arms race and it is the United States which refuses to have multilateral negotiations including the non-nuclear

weapon states in Geneva in the Conference on Disarmament.

RG: *You see the Conference on Disarmament as the natural forum for these negotiations?*

THORSSON: Yes, I cannot imagine any other.

RG: *But the Conference on Disarmament seems to have a very limited mandate. At present the most active item on its agenda seems to be a chemical weapons ban.*

THORSSON: But who is responsible for that? It is the United States. I do not think that the Soviet Union is more favourably inclined towards multilateral disarmament negotiations than the United States, but they are much cleverer than the United States. They know, of course, that the United States refuses to negotiate a comprehensive nuclear test ban in the Conference on Disarmament in Geneva, that they refuse to negotiate the issue of the prevention of nuclear war, the cessation of the nuclear arms race, indeed anything that has been placed on the agenda of the Conference of Disarmament as a result of resolutions adopted by the UN General Assembly in which the United States participated. But in Geneva they refuse to set up working groups and negotiating groups for that purpose. Also the Soviet Union knows exactly what the United States' positions are, so since every decision has to be taken by consensus, the Soviet Union can say 'yes', because they know that the United States will say 'no'. I often say that the United States provides the Soviet Union with a free lunch, every time they say no to these requests. But I cannot think of any other negotiating forum where multilateral negotiations as required under Article 6 can take place except the Conference on Disarmament which provides for closed meetings in specific working groups.

RG: *To what do you attribute this US and Soviet disinclination towards a multilateral forum negotiating disarmament?*

THORSSON: Their perception that they are superpowers. They don't think it's proper and correct that all sorts of small nations should sit and negotiate with them on issues which they feel are their prerogative to negotiate. When they are forced to negotiate they will do it bilaterally and of course the United States wants to continue the nuclear arms race. The present

Director of the Arms Control and Disarmament Agency, Kenneth Adelman, appeared before a committee of the House of Representatives in September 1983 and said explicitly: 'We are going to continue nuclear testing.'

I am going to the Third Review Conference in a non-governmental capacity because the NGOs have asked me to present to the President of the Conference the petitions that have been signed all over the world demanding a comprehensive nuclear test ban; I am going to do that with a speech in which I shall underline the responsibility of each state party to the NPT to negotiate a comprehensive test ban and nuclear disarmament and I shall say in very clear words what I think about the US delegation.

RG: *How do you regard the possibility that this time the neutral and non-aligned might try to have the declaration adopted by vote instead of consensus?*

THORSSON: I was put in that dilemma in 1975 because if there appears to be no possibility of a consensus decision, there could be a vote but it will require an absolute majority and it will also require a period of grace of 48 hours. In 1975 I didn't have 48 hours before the conference was going to end. The President of the Second Review Conference, who was from Iraq, tried his best to extend the conference but that was not possible. I would not be surprised if a number of neutral and non-aligned delegations tried this time to dispose of the time available in such a way that voting would be possible. But, of course, a majority vote in these issues does not matter very much in real terms because the United States is still a sovereign nation and can refuse to negotiate these issues in the Conference on Disarmament.

I shall say to the United States that although it accuses the Soviet Union of violating one treaty after another, they themselves violate treaties. The United States is violating the Limited Test Ban Treaty by refusing negotiations on a comprehensive test ban.

RG: *Their refusal to negotiate a CTB on the ground that adequate verification is not possible is not supported by seismologists.*

THORSSON: Yes, and President Reagan's invitation to the Soviet Union to send observers to the nuclear test in Nevada is absolutely ridiculous. At every session of the CD, Sweden has put

forward statistics on the nuclear tests undertaken in the previous years and we base that on the evidence from the laboratory we have in the National and Defence Research Institute.

RG: *Has Sweden not suggested a seismic data exchange as a measure towards attaining satisfactory verification?*

THORSSON: I proposed that when I was Swedish delegate to the CDU many many years ago and since then an expert group of seismic experts has been working with the aim of establishing an international network of seismic stations which will be able to catch signals from every nuclear explosion and distinguish them from earthquakes. Those which we already have in Canada, in Japan, in Norway and in Sweden are sufficient. Sweden would not presume to put forward statistics like that if we were not sure of them.

RG: *Which leaves us with little choice but to face the conclusion that the reason the US will not agree to a comprehensive test ban is because they want to continue testing?*

THORSSON: There are two reasons: one is the well-known argument that you must test the reliability of stockpiles of nuclear weapons because nuclear weapons do not last for ever, and the second is that they want to develop new types of warfare and weapons.

RG: *The most frightening aspect of the Strategic Defence Initiative (SDI) is that its proponents have started to contemplate a nuclear war as winnable. There are people within the US who are saying that if a nuclear war can be made less than cataclysmic; if nuclear weapons can be developed which are so precisely targeted that they cause destruction short of a complete holocaust, what is wrong with trying to improve the targeting, reliability and accuracy of nuclear weapons? There are some analysts who feel the 'nuclear winter' scenario is presented in a highly exaggerated way because it is posited on the assumption that nuclear weapons will be used in an 'unintelligent' manner by both sides.*

THORSSON: That is just evidence of their total lack of imagination. Tomorrow is the fortieth anniversary of the bombing of Hiroshima. The Hiroshima nuclear bomb and the Nagasaki plutonium bomb were toys compared with the present nuclear weapons. No one knows what sort of reactions will be generated by the first nuclear explosion to take place

after these forty years. We now know that both President Eisenhower and President Nixon have threatened nuclear blackmail against nations who dared to oppose their foreign policy. All this talk about the limited use of nuclear weapons is absolute nonsense.

RG: *Nixon's disclosures have revealed that none of the four occasions he cites in which the use of nuclear weapons was contemplated—the Indo-Pakistan war, Vietnam, the 1973 Egypt-Israel conflict, the Sino-Soviet confrontation—were going to take place in Europe. It is repeatedly said that a nuclear war, may begin in a regional Third World conflict. What Nixon says shows that it is less likely to be a Third World nuclear confrontation than a superpower confrontation in a Third World arena.*

THORSSON: It could be any conflict in the Third World where the two superpowers are involved to such an extent and in such a way that they find themselves facing each other. Then anything could happen. So far we know that at least in half of the conflicts that have taken place in the Third World since 1945 there has been intervention by one or both of the superpowers. So far, the intervention has been largely indirect but if they become more directly involved there is an immense danger. We have been close to a nuclear exchange more than once and when people say we have had peace for forty years because of nuclear weapons that is sheer nonsense. People speak so much foolishness in these matters because they don't understand what a nuclear weapon really is.

RG: *How could they fail to understand with the amount of information disseminated?*

THORSSON: A lack of commonsense, a lack of imagination, they can't really experience for themselves what it would be like. In a marvellous book, *With Enough Shovels*, published in the early part of Reagan's first term, a journalist, Robert Sheer, has an interview with a high Pentagon official, G K Jones, who among other things was responsible for civil defence and he said, 'Don't you know that a nuclear weapon is not all that dangerous, trams were running in Hiroshima three days after the explosion?'

RG: *On proliferation, is there not a great deal of hypocrisy among*

nuclear suppliers? The nuclear reactor industry has taken a nosedive because of the recession, and governments are under pressure from their own nuclear reactor suppliers to be less restrictive about export practices. One of the great dangers today is the way plutonium has become an internationally transferable material and the Reagan Administration is not taking such a restrictive attitude towards it as its predecessors did.

THORSSON: I am a firm opponent of nuclear power myself because I feel that the energy problems of the world should be solved in quite a different way. We can never make nuclear power harmless and there will always be security risks: there are risks in both operation and in storage of radioactive waste. I am fighting nuclear power here in Sweden. We had a referendum five years ago which decided that within a certain period we will abolish nuclear power in Sweden. By the beginning of the twenty-first century Sweden will no longer have nuclear power. The Reagan Administration boast of their restrictive policies but I am not at all sure of how effective these are. I know that they have exported heavy water to Argentina, for instance.

Whether or not the NPT is a success depends on what you mean by success. If it means that there has been no acknowledged horizontal proliferation since 1970, then of course that might be called a success. But if you consider vertical proliferation as important as horizontal proliferation then that has just continued. And, after all, Article 6, which I consider to be one of the key articles of the NPT, states that we should negotiate in good faith towards an early end to the nuclear arms race. Now, the NPT was signed in 1968 and went into force in 1970 and yet we haven't had one nuclear weapon less since then. On the contrary, the US has made a formidable build-up of new warheads. As you know, there have been many estimates of how many warheads would be needed if, for instance, the United States wished to annihilate the Soviet Union; the general estimate is about 400–500. The US has more than 30,000 warheads. So, in that respect also the NPT is certainly not a success.

As long as vertical proliferation is not stopped and the

nuclear weapon states do not consider in good faith what Article 6 really obliges them to do—to negotiate with us on nuclear disarmament—as long as that does not take place, the NPT cannot be a success.

RG: *You have made a very important contribution to research on the relationship between disarmament and development. You have warned about the competition between military spending and spending for development. Why is it that in most developing countries it is always development which loses? Did you address the political factors at work in this allocation?*

THORSSON: Yes, in the United Nations report which appeared in 1981 we devoted quite a lot of space to the political reasons for the level of rearming in the Third World. We had some very eloquent participants from countries in the South who were very articulate about the political aspects of the arms race in these countries. It was not my task in the Swedish report to deal extensively with the political reasons for the arms race in the South, but I felt obliged to take it up in the context of the Swedish export of weapons to developing countries. In the early 1970s, when I was a member of parliament, the Swedish parliament agreed in principle to the prohibition of export of weapons from Sweden. At the same time we recognised that for a neutral country such as Sweden, situated as we are between the two military blocs in Europe, in a sensitive area in the north with the Murmansk base quite close to us, it was necessary to have a fairly strong Swedish defence system and it was also necessary to have a weapons industry which could produce as much as possible of what the Swedish defence forces needed. We did not want to become dependent on any other weapons producer. We had a large and fairly advanced weapons industry for a small country such as Sweden and for Swedish defence requirements but it is not comparable to that of the Soviet Union or the United States or even Britain or France because we are a smaller country with a much smaller population. It was felt that Swedish-produced weapons would be very expensive if they were produced only for Swedish defence and not for export. So parliament set out some guidelines and some criteria which would guide the

government in its decision on applications for permission to export weapons. These prohibited export to countries with domestic or international conflicts, to countries who are actually at war, and also those disregarding human rights.

RG: *So who then are your customers in the Third World?*

THORSSON: Well, the joke once was that Swedish weapons exports are like exporting winter furs to Sudan. Weapons are bought never to be used but to keep the peace. However, that has changed. In 1971, when parliament took that decision we generally supposed that countries receiving weapons from Sweden would be other Scandinavian countries and neutral countries in Europe like Austria, Switzerland, Yugoslavia; however, the development of our weapons export has been quite different. In 1983, 45 per cent of countries receiving Swedish weapons were developing countries and in 1984 it was 41–42 per cent; the country which was highest on the list in 1983–4 was Nigeria. The next highest was India which has domestic problems and has border problems. The third on the list in 1983 was Singapore and we know now that Singapore is a weapons-exporting country. So contrary to everything that is said when the Swedish government gives permission to export weapons to Singapore, Singapore has exported them further to third countries, and we never know where in the world we will find Swedish weaponry.

One other reason why it is so difficult to control and check the flow of Swedish weapons is that the firms are quite free to market their products before they apply for permission to sell them. When they see that they might get a contract they ask the government for permission and at that point, for political reasons, it could be quite difficult to refuse. One should also consider the fact that almost half of the developing countries have military regimes which may be importing weapons from abroad in order to keep down unrest in their own country. I cannot name the country but in December 1982 we sold Kalgusta guns to it and the Swedish government seem to have been unaware of the fact that there had been a guerrilla war in that country for decades. There is a movement in Sweden to have all weapons export banned completely and my findings in that report support many of the arguments that they use.

- 3) Are you willing to forbid the export of weapons from your country
– if all other UN countries do the same?
- 4) Are you willing to cooperate in joint action so that clean water, food, elementary health-care and school education will be guaranteed to all people in the whole world?
- 5) Are you willing to solve future conflicts with other nations through peaceful means, and not through military actions or threats?

With the fourth question we excluded the last phrase because we felt that every government should, irrespective of what others did, undertake that and also the fifth—the peaceful solution of conflicts in accordance with Article 33 of the United Nations Charter. This journey was planned purposely for 1985, the fortieth anniversary of the United Nations, in Europe as the first stage and for two weeks in May 1985 groups of people, men and women from some sixteen European countries, travelled to different European capitals. In February 1985 I wrote to all the governments, to the prime ministers of every government and said that you will be visited on such and such a day by the delegation of the great peace journey and these are the five questions that will be put to you by them, we request written answers, 'Yes' or 'No'. No evasive answers or lot of arguments or excuses—'Yes' or 'No'. The governments of twenty-eight countries were addressed and twenty-five countries received the delegation. Sixteen countries in Europe unequivocally said 'Yes' to some and 'No' to others. The three governments that have been most unresponsive are Bonn, Paris and London.

In democracies, governments are accountable at election time to voters but in the nuclear age all governments are accountable to all people in the world at every stage, and so we have the right to put questions and request written answers. Now, of course, we do not imagine that this will change the minds of those governments overnight. But we have in writing from a particular government that it will stop the production of weapons of mass destruction if all other members of the United Nations do the same, we will

have a new basis for international negotiations. Once you have said 'Yes' to that question, how can you refuse to negotiate? Will you be prepared to be the only government to continue to produce nuclear weapons if all other members of the United Nations stopped? This is exactly what I have written to Mrs Thatcher. I have said I am convinced that the British government will not stand out as the one saying 'No', expressing doubt or giving ambiguous answers. And I have written this also to President Mitterrand and to Chancellor Kohl. The Swedish parliament said 'Yes' to all the questions as did fifteen other governments in Europe. We will continue now to put questions either by visits or in writing to all governments of UN member states, including developing countries. In 1986, the UN Year of Peace, we will conclude by visiting Washington and Moscow. The United Nations Charter starts by saying 'We, the peoples of the United Nations' but in the various UN bodies it is the governments who speak and we emphasise that they are accountable to the people: we have the right to question them and to demand their answers. All these governments have freely signed the United Nations Charter whose Article 33 gives very clear advice on how to solve conflicts between states peacefully.

RG: *Do you think that this is the kind of peace movement we need today rather than the 1983 peace marches, which were specifically about the deployment of Cruise and Pershing?*

THORSSON: I think this is a new approach. I am all for the peace movement fighting particular weapon systems, especially nuclear weapons, and now also chemical weapons but they have unfortunately experienced serious failures so far. I remember that in the summer of 1983 I warned them that they would not succeed, the Pershing II will come. There was every sign that the Pershing and the Cruise missiles would be there by the end of the autumn of 1983.

RG: *But would you have advised the peace movements to have acted differently from what they did?*

THORSSON: I think they should not have put all their cards in one hand because the disappointment became so immense. For a greater part of 1984, the peace movements were very depressed because of their defeat in the autumn of 1983.

Now with our peace journey we do not attach particular importance to any one weapon system. We say: are you willing to take steps to ensure that development and deployment of mass destruction weapons including nuclear weapons is forbidden in your country, if all other member states of the UN do the same?

RG: *Do you fear that if discouragement sets in, the peace movement will have a drop in membership, that people will start to endorse government policy. A lull could be just a reflection of exhaustion?*

THORSSON: I do not think that any peace activist will ever endorse official government policies in this field. Even now the peace movements both in the United States and in the United Kingdom are active. I shall participate in a conference in early September 1985 in Geneva alongside the NTP conference organised by the Nuclear Freeze Campaigns both in the United Kingdom and in the United States and I hope that they will gather a great number of people in Geneva.

RG: *Are you planning to create a forum or platform so that if peace workers in developing countries encounter repression, there would be somebody in a free society who could publicise their case?*

THORSSON: In democracies, the governments govern by the grace of the people. It is the people who allow them to be in government. In dictatorships the situation is different and there the government may have to feel the pressure of public opinion from abroad. For instance, as soon as Moscow is criticised in any way for their policies, they become worried and anxious because they don't want to be criticised. They want to appear peace-loving, and I must confess that I am in some doubt as how to react to Mr Gorbachev's declaration of a moratorium on nuclear weapons testing as from 6th August 1985 and for five months ahead. He has said that if the United States reacts favourably he will extend it, but the United States has already refused his offer as just propaganda.

RG: *Secretary of State Shultz responded to the Gorbachev offer by saying we remember how they ended the last moratorium with a bang, referring to the one from 1958 to 1961.*

THORSSON: There were definite reasons why Khrushchev broke that moratorium, but then John Kennedy took the initiative in 1963 in the Spring and said that if the Soviet Union now agrees with us we shall have a moratorium until the nuclear test ban treaty is signed. The Limited Nuclear Test Ban treaty was then negotiated during a few weeks in 1963.

RG: *But what the press has publicised a lot is the Soviet Union's failure to keep to the ban.*

THORSSON: That was in 1961 and the situation was that Kennedy had won a fairly narrow victory over Nixon in the 1960 presidential campaign, particularly because of his emphasis on the missile gap and that had worried the Soviet Union considerably. So when Kennedy came into power with a rather hostile Inauguration speech in January 1961, the Soviet Union felt that there were new threats. I think one should always remember that during the decades of the 1950s the 1960s and the 1970s, in twelve cases out of fourteen the United States was the one who initiated the new weapon systems, not the Soviet Union. However much I dislike the dictatorial system in a country such as the Soviet Union, one must also remember the history of that country and how many times it has been invaded, particularly from the West. In World War II, the US lost 300,000 people, the Soviet Union lost 20 million people. Three hundred thousand people corresponded at that time to 0.3 per cent of the population of the United States, 20 million people was 10 per cent of the Soviet population, and almost the whole European territory of the Soviet Union was devastated. I want to approve of the moratorium. If one follows the international debate on the arms race and disarmament, people are very often in despair about the lack of progress in both bilateral and multilateral negotiations and then they ask why unilateral restraint measures are not tried. Why not announce that from this day we shall refrain from, for example, nuclear weapons testing and that we await the response from our adversary or our potential adversary? This is exactly what the Soviet Union has done.

RG: *What progress do you think there has been in the Geneva talks?*

THORSSON: The problem is that each side wants to negotiate on its own

conditions. As long as the United States insists on continuing research in the SDI, I don't think that there will be any step forward towards agreement in the Geneva negotiations. Both countries, particularly the Soviet Union, are so negative towards each other and so full of distrust. The Soviet Union is certain that any defensive weapon system under research or development in the US is a preparation for a first strike. That is why the Soviet Union and the United States in 1972 managed the ABM treaty to limit anti-ballistic missile systems to just one in each country. The United States has built one, the Soviet Union has at least one. Under the protection of a defensive system, each of them suspected the other of preparing an offensive first strike. As long as this immense distrust continues I cannot see how the Soviet Union can change its views on SDI research.

RG: *A number of commentators have also attributed the Soviet Union's paranoia about SDI to its deep-rooted sense of technological inferiority to the US.*

THORSSON: There again, the United States just confuses the issue. They say, 'Well, look at the Soviet Union. They have had anti-satellite research for years and years.' Now the SDI is something quite different from anti-satellite weapons which are supposed to be shot from the earth to kill satellites in space; the Strategic Defence Initiative is something quite different. What I am really very worried about is what they are doing now in research in the United States. For this enormous sum of 26 billion dollars they will explode laser beams, the short X-ray laser beam which will, as Professor Abdus Salam said in New York, require such an immense amount of energy to be released that it will require a nuclear explosion.

RG: *But this is supposed to be the non-nuclear weapon system which will make nuclear weapons obsolete?*

THORSSON: It is so immensely ridiculous. In his 23 March 1983 speech Reagan said that they will develop these weapons in order to make nuclear weapons obsolete. It will be a shield protecting US citizens all over the continent. Suddenly, very quickly, they found out that that was impossible. The scientists know that the Soviets just smiled derisively; then

Weinberger was put forward to say that in the first stage we will see to it that there will be a protective shield over the intercontinental ballistic missile Seagulls. Of course, the whole MX thing is another example of the shortsightedness and the narrowness of the views of the United States; they know that in the Soviet Union's strategic nuclear weapons arsenal, the greatest proportion is intercontinental ballistic missiles. Seventy-five per cent of the Soviet Union's strategic weapons are ICBMs, the rest are carried by aircraft and submarines. In the US the situation is directly the opposite. They have only 25 per cent in intercontinental missiles, and 50 per cent of weapons are carried in submarines and 25 per cent in aircraft. Now it is well known that intercontinental ballistic missiles are immensely destructive and as they improve in accuracy they are really formidable weapons; however they are also the most vulnerable. The United States argues that the Soviet Union must reduce their stock of ICBMs, and Reagan's first disarmament proposal to the Soviet Union was for the reduction solely of ICBMs. Of course, the Soviet Union rejected this immediately because the US would then retain its formidable superiority in nuclear-armed submarines. Now the US under Reagan intends to develop the MX missile which is a formidable weapon, very accurate, very very destructive, but also very vulnerable.

RG: *Do you think arms control negotiations are going to be able to keep pace with all these developments?*

THORSSON: Well, the problem is that negotiations take such a long time and this is one of the reasons why so many people now discuss new approaches to disarmament. There is a race against time in disarmament negotiations and the longer it takes to complete disarmament negotiations, the more difficult it will be to conduct them, for technology proceeds faster than disarmament negotiations and we are now developing weapons systems which are almost unverifiable. The cruise missiles are the best example because they are small, they are mobile, no one can judge from outside if they have a conventional warhead, a chemical warhead or a nuclear warhead. How can one verify the reduction of cruise missiles? Reagan is producing thousands and thousands of

cruise missiles, bomber-borne, airborne-cruise missiles. The few that we have now in Europe are just toys compared with the ones that are being produced in the United States.

RG: *The Scandinavian countries have shown a great interest in promoting nuclear weapon-free zones and now the South Atlantic Forum is considering it.*

THORSSON: I doubt if it will be possible to achieve a nuclear weapons-free zone in Nordic countries in war-time. The way in which the US, the UK and the Federal Republic of Germany have reacted show that it will not be possible. In peace-time there are no nuclear weapons in Scandinavia, in Finland; we are all parties to the NPT and very faithful to that end, but Norway and Denmark are members of NATO, and the Soviet Union with its immense naval base and airbase in Murmansk is very close to the Norwegian border. The Soviet Union also has a number of submarines in Baltic waters which in wartime would have to go through the straits between Sweden and Denmark in order to get access to international waters. The Soviet Union has an interest in getting out through these straits to the Atlantic, and NATO has an interest to keep them confined in the Baltic. So, all of us face dangers in war-time and with the NATO strategy of having the right to use nuclear weapons first (not the first strike but the first use) makes it extremely improbable that they will ever allow the Nordic countries a nuclear weapon-free zone in war time.

RG: *There have been suggestions, that the really sensitive areas like the Middle East should be declared nuclear weapons-free zones.*

THORSSON: You know I am a heretic as far as the Treaty of Tlatelolco is concerned. It is one thing that the superpowers with some exceptions have now signed the additional protocols to the treaty. I am absolutely convinced that if the United States or the Soviet Union, or the United Kingdom for that matter, sees it in their interest in war-time to use nuclear weapons against any country in Latin America, they will do it. No treaty will apply in war-time, particularly during a nuclear war. Arms controls negotiations and conventions are there to prevent war from happening, but once war breaks out, there will be no return, they will not respect any treaty

whatsoever. It is a very frightening thought, but we have to learn to live with it.

RG: *It is a very discouraging thought. So many years are spent negotiating these treaties and their clauses in committees and sub-committees only to discover that when it really matters they are not going to be a restraint on anyone.*

THORSSON: But the only thing that matters is to prevent war from ever breaking out. This is the reason for the questions in the peace journey. Article 33 of the Charter tells you exactly what governments should do in a conflict with other countries. The parties to any dispute, the continuance of which is likely to endanger the maintenance of international peace and security, shall first of all seek a solution by negotiation, enquiry, mediation, conciliation, arbitration, juridical settlement, resort to regional agencies or arrangements or other peaceful means of their own choice. The Security Council shall, when it thinks necessary, call upon the parties to settle their dispute by such means.

RG: *What was your reaction when the US Congress lifted the sixteen years-old moratorium on the production of chemical weapons?*

THORSSON: I hope that resistance to that decision will continue because of the terrible effects of the use of chemical weapons. The military are delighted at the decision because the new chemical weapons are very much safer to store, being relatively innocuous until they are combined. They are cheap. It is said that chemical weapons are the nuclear weapons of the poor countries of the world because every country with a chemical industry of some kind can produce them. We have been negotiating in Geneva on chemical weapons for some time now. The chemical weapons issue is extremely complex and difficult, particularly as far as verification is concerned because 1) it requires inspection inside chemical industries, most of them in market economies privately owned, and 2) there are 'double agents' which are poisonous, but can also be used for peaceful purposes, such as fertilisers.

So it was found out that it would be easier to agree on a convention banning just bacteriological weapons; it was considered to be in the self-interest of everyone to achieve

that. So in 1972, the same year as the SALT I was concluded, the convention banning production of bacteriological weapons was also signed. However, since then there have been negotiations in Geneva year in and year out on chemical weapons; in the last two years there have been real negotiations in the close working group within the CD on the treaty text but there are still some very difficult obstacles, particularly in the area of verification.

RG: *What do you think of the international community's response to Iraq's use of chemical weapons against Iran?*

THORSSON: I share the disappointment that there wasn't general condemnation and consistent condemnation. The United States considers it in its self-interest to keep Iran down, it is an inheritance from the hostage issue and because of that, in spite of Iraq's aggressive policies. After all, it was Iraq who started the war in September 1980, but the US condoned Iraq's action and strengthened its relationship with Iraq. It is only when the narrowly conceived self-interests of one of the big powers are really hurt that they will understand what it is all about.

RG: *You have had a major debate in Sweden on radioactive waste disposal?*

THORSSON: It was part of our referendum debate. We are worried about radioactive waste and we have refused to build an enrichment factory here in Sweden. We have had a very hard debate on whether the spent fuel should be enriched to release plutonium or not. The general feeling now is that Swedish spent fuel should not be enriched. What still causes a lot of argument is that if we have decided on a nuclear power programme, which we did in the late 1960s and early 1970s (before any one really quite understood the dangers involved) we should take care of our own waste, we should not burden any one else with it. No area of Sweden has yet been finally approved as a storage for radioactive waste because the people oppose it. There is a mountain in northern Sweden, on the west coast close to the Norwegian border which has been under examination for storage. For six years now people have kept watch over that mountain, taking turns, to make sure that no one will dump radioactive waste there.

RG: *That is a tremendous manifestation of organisation and commitment. When you look back over these five decades of working with the peace movement, what do you regard as its achievements and what are your disappointments?*

THORSSON: I think that the peace movement has changed considerably during these decades. In the 1930s when I joined one of the international peace movements, we were small groups of people who were very concerned and very involved. Since then their membership has increased tremendously. The churches, the trade unions, all manner of what we call popular movements have taken up disarmament issues and peace issues and they have increased their awareness and their knowledge immensely. People who have worked in peace movements today or in any popular movement dealing with peace and disarmament issues know so much about the subject. As a Swedish disarmament negotiator, I cannot go to the US or the Soviet Union disarmament delegation and say that they must stop producing nuclear weapons now, it is not good for them. I can't do that. I must have technical knowledge, substantive knowledge, strategic knowledge, and because of that from the very beginning the Swedish government has involved our national defence research institute in our disarmament efforts which gives the Foreign Office all the technical data it needs. The same is true about the peace movement. We are extremely knowledgeable, we know what we are talking about. All the many professional groups against nuclear weapons have been extremely useful. Doctors are involved, lawyers, scientists, engineers, researchers, teachers, every profession you can think of now have their national and international groups working against nuclear weapons. Each of them contributing with their particular experience and competence in the field serve to increase the amount of knowledge over the last few years; with all this information peace movements should confront their governments. They should not limit themselves to marching in the streets, shouting slogans, bearing banners. They should ask their own government 'What are you doing? You are a member of the United Nations, what are you doing for disarmament?' Governments should be kept accountable.

The transition to democracy in the Third World

I am not here to inaugurate this conference with a mere ceremonial speech, nor is my presence here just the fulfilment of yet another of the many engagements I have to carry out as Head of State.

It reflects a personal regard, which I believe echoes the general regard, for the importance of this event which has brought you together and which transcends the academic debate—excellent in itself—about to take place here.

The democratisation of Argentina, the freedom of her capital city, the recovery of the university, the scope of the coming days during which we shall reflect upon a set of problems which closely affect every one of us—all this has, if you will, a deep emotional significance.

So it is not only the President of the nation who is here to demonstrate official support at the highest level of government for this conference, but the politician, the citizen who wishes to share your hopes and to show his gratitude for this genuine tribute to Argentinian democracy.

How many times during all those years of tyranny did we political leaders and students of the political scene meet in secret, in darkened rooms and meeting places improvised in semi-secrecy, in order to plan a possible democracy, so better equipping ourselves to fight to achieve it! In those days we certainly never imagined that we would find ourselves years later in this university, breathing the air of our regained freedom, with our democratic institutions fully functioning, in order to continue planning for democracy while actually building it.

The events of December 1983 were only the beginning of the establishment of a democratic order. This and only this was the task which the people and government of Argentina—a state whose legitimacy was questionable, a society which was beginning to realise the magnitude of its problems—undertook in an exceptionally difficult economic situation and in the context of an international climate beset with many uncertainties.

This speech was delivered by H E Senor Raúl Alfonsín, the President of Argentina, to inaugurate the conference on 'The Transition to Democracy in the Third World' organised by the Third World Foundation in cooperation with the University of Buenos Aires in Buenos Aires, 27–29 August 1985.

A political order is, of course, built on the basis of an ideological system; but its survival is linked to the ethical foundation which inspires it and to its ability not only to resolve the conflicts which every society produces in the course of its development but also its ability to create the conditions in which ethical values can prevail. Thus politics and ethics are inseparable and as a result the transition of authoritarian regimes to democracy not only involves re-establishment of democratic institutions but also daily practical affirmation of the ethical values on which they are founded.

Transformation cannot be confined to institutional aspects, for long periods of dictatorship have had a general effect on economic, social and cultural orders and generated standards of behaviour not always compatible with the democratic system to which our society aspires. Peaceful coexistence, the total abolition of any form of violence, guaranteed by the force of law, create ideal conditions for the transformation and modernisation of the economy and the whole of our society.

The democratic institutions are functioning normally in this country; we have an independent judicial authority able to settle civil disputes and to oversee government activities; we have a parliament able to make laws out of the desires of the people; political competence is assured and within reach of all, and an unshakeable respect for human rights and individual liberty is the common inheritance of government and people alike. This is already a great deal, but we nonetheless know that it is not enough, that our responsibilities in building a democracy demand that we should all work harder.

We know that the difficulties of transition are as numerous as their origins; unsatisfied popular demands, lack of technology, inappropriate cultural habits after many years of censorship and isolation which sometimes present not so much a set of problems but a state of mind which conspires against the best of intentions.

Each one of us here today knows from bitter experience how our land has suffered in the recent past, and that our being here today, two years after we set out on the road to democracy, to reflect on our situation and that of nations undergoing similar change, our being here—political leaders, civil servants, scientists from Argentina and abroad, professionals, students and citizens—is an occasion which inspires and enriches our newly begun life of liberty. With the vivid memory, the recollection and meticulous analysis of our historical experience, with the balance-sheet of our present situation and with our sights set on the

future which we desire—as Spinoza taught us, ‘Do not weep, do not be angry, only understand’—through understanding, let us advance with a broader and clearer view of the horizon towards which we are striving.

If you will allow me to begin by trying to define what transition means here and now for Argentinians, I would say that it means living through painful memories and shared hopes, through this time when the paths cross of what is old and dying and what is new and being born. It is this feeling of profound change, mutation almost, which is emerging from the very heart of our society in a process of growth, with lines of continuity and points of fracture, with situations in which we are confronted with crucial dilemmas; in short, with the feeling of being in the process of forging our destiny with our own hands.

You are well aware of the colossal task that we, the political leaders, have before us, in this transition process through which we are living, in going ahead with the drastic reforms which will reshape outdated structures. The responsibility of the moment is enormous, as enormous as the sufferings and obstacles which have beset us and which were increased by endless frustration, helplessness and absurd quarrels.

Argentina is now immersed in a process of transition. This is what we call this inevitable stage of complete reorganisation and reconstruction of the country, after the long period of economic decline, the breakdown of republican institutions and the destruction of the social fabric through which we have lived during these recent decades. Today in Argentina, transition is not a word which defines mere intellectual exercises, but which expresses a concrete experience, a burning sensation of enacting moments of profound change, both in our relationships and in ourselves. Everything is changing in Argentina. Modes of behaviour, daily interaction and attitudes and an emergent creative energy demand from the leadership new solutions to old problems. There is a renewed social conscience which is still building on the terrible experience of our recent past and which now lives with the conviction of being on the threshold of new kinds of political and social organisation and achievement, more democratic and more just.

When there appeared on the national horizon the possibility of transition to democracy, it became clear at the same time that tremendous problems would be inherited by our society and by the government elected by the people to initiate that change. Democracy has given the country a scenario which could not be more complex. It was enough to make an inventory of the problems and to observe the

Accession Number.

hitherto unknown nature of many of them to conclude that the challenge we had before us was formidable.

But we embarked upon our task with the utter conviction that the democracy we had regained was the only political system and the only form of coexistence which would give us back our freedom and dignity, both as individuals and as a nation. Two years ago, we in Argentina finally returned to democracy, to our constitution and our republican institutions. Within this juridico-political framework, we set out to redeem the country from darkness and backwardness, endow it with a new productive and social structure at home and earn a worthy and creative role in the international community.

We know full well that this task will not be accomplished in one day and that it cannot consist of spasmodic or propagandist action, either by the government or by the people. The fabric of poverty is still standing in our country and it would be naive to assume that we will break it down by headstrong action or by a unilateral government decision. It will require years of day-to-day changes, some of them imperceptible, others radical, in order to bring about the transformation which we Argentinians are seeking. But it will, no doubt, be fewer years than those during which we were in decline.

This particular moment in our history is what we rightly call transition, a transition which passes from the dismantling of a system of domination imposed by fear and terror, unimaginable in today's world, to the establishment of democracy as a political regime and as a life-style. It is the moment of frenetic work when we are starting to lay the foundations for the creation between us of a structure that will mean prosperity for many, because a growing country which encourages investment and distributes fairly the results of its production makes it possible for everyone to share in its benefits.

This is how we envisage this participatory democracy which we are building; a system of life in which each citizen—against a background of mutual respect and civilised and pluralistic coexistence—has the right to an opinion and a share in decisionmaking, as well as the ability to build.

The Argentina of conflict and frustration is dead. We have left behind not only the atrocious authoritarian intrigues of the last dictatorship but also fifty years of decadence, disorder and political, economic and cultural instability; for we have reached a turning-point in our history and we are again starting out on an uphill path, our eyes fixed on a common destiny of reconciliation and fruitful effort. A modern and vigorous Argentina is being born: an Argentina which has returned to

the values of its founders and its fundamental institutions and is projecting them towards a different future. We are moving towards that Argentina.

We are creating a synthesis of rich historical experience, of incomplete plans, of social movements and diverse outlooks which have converged in the face of the necessity to formulate a better future.

We are not, therefore, only moving within the confines of the passage from dictatorship to democracy. If this were so, if this were the way we understood the problem, one could almost say that the transition is reaching its culmination and is doing so with resounding success for the people of Argentina.

Argentina is offering the world an example of peaceful transition: she has shown that it is possible to emerge from ignominy and destruction, even against a background of tremendous limitations and enormous obstacles, without serious débâcles, without violence and with strict adherence to the law. The passage from the Savage State to the State of Right without concession, where no one takes the law into his own hands, where there are no reprisals, where there is common sense and balance—this is a reality which is spreading through Latin America, cementing a definitive social order founded upon consensus and, fundamentally, on ethical bases of justice, peace and liberty.

So we envisage a transition which does not wear itself out rebuilding democratic institutions, respect for individual liberty and human rights. The conquest of these is inevitable and fundamental, but is not in itself enough to overcome the defects of old and the current limitations which we must confront. Fundamentally, in a continent which is suffering real hardship—influenced by external debt and difficulties in international trade, as well as technological innovation—we are fully conscious of the fact that the future of our democracies will be in serious danger if we do not, at the same time, find a way of bringing about socio-economic changes which can satisfy popular demand for greater participation, fairer distribution of wealth and an improvement in the material and spiritual conditions of life.

Thus the redefinition of the role of the state, the strengthening of civil society, the modernisation of the means of production and the revaluation of science and technology within the ethical and humanistic framework of democracy, are pillars on which we must build with greater independence between nations. These are also themes of major importance for transition.

The entire world is experiencing a general crisis which could mean

either an expansion such has never before been seen or its final destruction. A new revolution has erupted, transforming old production methods, economic relationships and cultural behaviour. The nations of Latin America cannot be relegated to the margin of history, almost ignored by the technological world. This is why part of our colossal task is to strive together for a more just and equitable international order which will lead to progress for the whole of humanity, and to work at the same time on our own development, conscious that we cannot miss out on the current scientific and technological revolution without being left out of the world decisionmaking process.

This common task which awaits us is tough, but auspicious and encouraging. This is because there exists a basic agreement—a reflection of the new conscience which I mentioned a moment ago—about the value of political democracy as an indispensable framework for the building of the country we want.

The Latin American nations who are overcoming their tragic cyclical destiny of instability, insurgence and authoritarianism, are adopting political democracy as the basis for the recovery of their lost destiny. They realise that democracy is the only viable way to make real advances in economic and social reform; the only institutional framework which will lead them away from barbarism and allow them to make rational, impartial and forward-looking decisions. For this reason, perhaps we can discover the deepest meaning of these transitional processes in the change in thinking and attitudes of every man and woman who makes up our societies, a change from passive acceptance of their allotted place in democracy to active identification with and defence of the democratic system.

This is not, of course, achieved in a short time. What are needed are changes which are sufficiently energetic but at the same time sufficiently balanced in order not to create chaos in the face of fresh circumstances. It is necessary to undertake a gigantic cultural reform which will instil in us a general regard for a way of life that will guarantee civil rights, and encourage tolerance and mutual respect; which will protect the freedom of the people and banish fear, coercion and disorder from our society.

This cultural reform also includes necessary changes in the old forms of political activity. The responsibility of the modern politician is to initiate a closer dialogue with the people, to listen and learn from the ideas, behaviour and needs of others and to reflect the opinions and way of life of society as it really is. In these countries where there is so much

to do, politics can no longer be something that takes place behind closed doors, a one-way flow from the top downwards, but something which is open at every level through better communication and deep social bonds.

It is precisely this that our founding fathers dreamed of. In the words of Juan Bautista Alberdi in one of his many writings: 'Improve society in order to get the best out of power, which is its expression and its direct result.'

But the transition to democracy is, of course, a historical phenomenon unique to each nation and it would be wrong to approach the issue on the assumption that there is some universal formula for diagnosing difficulties or for the happy outcome of transition. But we also know that there are many factors in common with those cases which are to be analysed at this conference and which transcend individual peculiarities.

Allow me to point out two factors which seem to me to be generally applicable to transitions to democracy. In the first place, we should remember that democracy and its survival is dependent upon the consent of the people, on their clear and constantly renewed desire to build a legitimate political organisation for the peaceful solution of conflict. Nothing can replace the conscience and will of the people which are the very basis of democracy and which must therefore always be allowed expression and maturing alongside the growing system. But, as we know, democracy is not only consent but also dissent, and respect for the other person's view and for diversity. So it is not just a matter of attending to the mechanisms which generate consent but also of recognising—not merely tolerating—the value of the dissent, acknowledging it as part of society's creativity. Consent and dissent are always important, but they are even more so in the transition to democracy which demands extreme flexibility and understanding.

The second element is something more subjective but no less important. Democracy is established, as I have said, on the basis of difficulties which have no immediate solution and which require effort, perseverance and great generosity. It is impossible to imagine democratic consolidation without a medium and long-term vision, while always taking care that immediate solutions do not have a negative influence on the future. This willingness of society to see democracy as a self-correcting system that can turn human aspirations into reality is not merely dependent on individuals and social groups; it also greatly depends on those political leaders presiding over the transition, on their

ability to generate confidence and credibility, which means it depends as much on political parties as on civil groups.

If the authoritarian system was always characterised as closed and obscure, the democratic system must be seen as its antithesis, an open, transparent system. So the transition to democracy is the road travelled by peoples and institutions, whose differences are reconciled in a form of coexistence based on mutual respect, with the capacity efficiently to decide the common destiny, formulate a value system and honestly manage public affairs. Our own experience allows us to show now that democracy is not only possible but that it is better than any other system we have known; that contrary to what is sometimes said, not only is it possible in developing countries but it ensures that their development is not a chaotic accumulation but the embodiment of the society's hopes.

Democracy is not, nor can it be, the preserve of developed countries. Those theories which maintain that there are historical preconditions linked to social, cultural, economic or political characteristics which favour democracy underestimate the impact of the processes of political transformation under way in many Third World countries. These countries, face to face with the challenge of having to build simultaneously—in periods of time which are almost insignificant within an historical perspective—the Nation, the State, adequate structures to ensure economic growth, social justice and supranational integration, have acknowledged the need to adopt a political system which is not only efficient but also capable of establishing fundamental values, both individual and collective, which will allow free reign to a fulfilling life. This is why Third World countries are more and more rejecting authoritarian regimes which contravene human rights and which have shown themselves incapable of solving basic economic and social problems.

Frequently, dazzled by the illusion of easy economic success, Latin American countries have succumbed to the temptation of abolishing all political systems. They believed that social and parliamentary debate were a waste of time and that the removal of all debate would save time and lead to greater efficiency. Time has shown implacably that public participation in debate and in the making of the nation cannot be removed without causing grave damage to all reasonable development.

It is now unanimously accepted that no one can separate economic and social development. No one, it should be said, must separate these two from political development and the construction of an overall democratic system. When elementary ethical principles are forgotten

and the means are separated from the ends (the process of development from the potential beneficiaries of that process; the political system from the life of the community) the horizon of the nation will darken and it is always the most vulnerable who pay the price.

It is precisely here at this conference, where the problems of transition to democracy in the Third World are to be analysed, that we must affirm our conviction of the necessity and possibility of democracy, both for economic development and for the achievement of a more just social order.

Certainly, it is not a matter of ignoring the problems or dealing with them indirectly. It is necessary to discuss, as you are about to, the implications of the legitimate fight for better living conditions and for consolidation of the democratic order; the way in which open expression of diverse interests can affect social solidarity; the manner in which military, political and ideological conflicts which are rocking the planet influence and impede advancement towards a firm democratic system; the relationship between the security of the state and its citizens and individual freedom; freedom of expression and the right to privacy; in short, the reconciliation of the aspirations to change which inspire us all, and the need to protect the roots which bind us to a past which can no more be renounced than can the nation itself.

This same debate which is about to begin is none other than the expression of the very democratic system that we are building; no one has been or should be excluded; every voice and every cause should be given a hearing so that, at the end of each day, we may acknowledge one another as members of mankind and members of the brotherhood of free men. I am convinced that these contributions from science, politics, or both, will be important elements in the theoretical explanation and in the political consolidation of democracy. With the participation of you all, the common desire which motivates us will endure and make its own contribution to the future of mankind.

So Buenos Aires will become for a few days the centre of international discussion and debate about the process of change through which the nations of the world are going, working towards the achievement of their rights and dignity. This is itself an incentive to strengthen our present movement towards the definitive consolidation of democracy.

We shall have the opportunity of exchanging experiences, communicating more clearly from the standpoint of the particular situation of each nation, but in the knowledge that we are living through

similar stages in our historical evolution, in both our achievements and our difficulties. For the subject that brings us together has the virtue of linking the accumulated thought and findings of 2,500 years of political science with the needs and problems of those countries that are boldly demanding growth, well-being and justice for their people. Historically, democracy has restored values which apply today: protection against all forms of arbitrary political power; notions of citizenship and political equality, leading to the fundamental principle of one person-one vote in the independent election of political authorities; the creation of a model of interaction between individual, society and state, through its forms of representation. In the twentieth century, democracies have succeeded in spreading to a significant degree those civil rights that are considered inalienable; the right to life, protection of the person, free expression and free association.

The correlation of all this is the possibility of massive popular participation in basic political activities, as demonstrated by the political parties and the right to vote in order to resolve fundamental political issues and to elect governing authorities. However, as we have already said, twentieth century democracy should not wear itself out with these fundamental matters, but should extend its activities to other spheres. Protection of the person acquires universal interest when the protection of the physical person against arbitrary political power is coupled with the safeguard of the basic necessities of the individual.

Contemporary democracy involves the search for satisfactory answers to the vital necessities of food, housing, education and health care. At the same time, democracy today stands for the participation of the people in decisions which affect their life today or the alternatives for their future. This calls for the cooperation of political parties and regional political groups, as well as that of other groups involved in the everyday life of our society. Democracy demands that everyone should play a more active role, in the family, at school, in the workplace, in voluntary organisations; in short, in every situation where decisions are made which in one way or another affect the life of the community.

At the dawn of the twenty-first century, the countries of the Third World must face the challenge of intricate and complex international conditions; they must seek out suitable forms of technology and solve the pressing problems posed by their societies. Thus it is essential to formulate entirely just policies, and, confronted with such a challenge, the democratic system has the particular virtue of safeguarding the

DIA

interests of the many elements of the societies of Third World countries. Different cultural, religious, ethnic, linguistic and regional groups can actively make their own unique contribution to the shaping and achievement of national objectives within the political framework of democracy, due fundamentally to this system's institutionalised respect for diversity, tolerance and participation.

These ambitious but feasible political objectives call for painstaking work on the part of each society.

It is unrealistic to assume that the decline, crisis and defeat of authoritarian regimes and their replacement by democratic programmes necessarily means that democracy will survive in a society. The transition towards consolidation and strengthening of democracy is a complicated and risky process which inevitably calls for changes in political cultures, in the network of institutions and, fundamentally, in the adaptation of the political class to the new circumstances and requirements; all this against a background of international conflict, obvious economic difficulties and growing social expectations and demands.

The presence at this gathering of prominent and high-ranking specialists in the social sciences, political and military leaders, and economists, inhibits me from going into too much detail of the set of problems we are examining. But I am certain that in each of the coming sessions there will be valuable debates and exchanges from which we can gain illuminating insights and different ways of looking at a reality which calls on us to act, and that—with better alternatives arising out of this broad and many-sided dialogue—we, the politicians, can continue to surpass those goals already achieved and make constant and uninterrupted progress towards greater ones. We know that the success of this transition and stability for this change to freedom that we are carrying out depends in the end on our capacity to mobilise energy, resources and knowledge, and systematically organise ideas and devise concrete strategies for the attainment of our proposed objectives.

So I emphasise the fundamental contribution that politicians and society expect from you to enable them to continue on this different road in this new direction and to advance boldly towards consolidating the democratic system, building a system of economic growth with fair distribution of wealth, creating imaginative ways of participation and achievement of social dignity.

And if you ask me if this is possible, I would remind you of the Spanish

thinker who called 'Argentiniens, to work!', and said 'I do not know if it is possible, I only believe it is necessary.' And with this invocation let me emphatically declare that it will be possible because it is necessary.

WOOD**

Behind the diplomacy: Namibia, 1983–5

In this paper we document and analyse the key developments affecting the struggle for Namibian independence since the beginning of 1983.¹ We aim to give an account of the dynamics of this struggle both within and outside Namibia. In many analyses of events in Namibia, the experiences and struggles of Namibians themselves are played down or go unreported. We try, therefore, to give these the prominence they warrant.

SWAPO (South West Africa Peoples Organisation) has been highly successful in isolating South Africa diplomatically so that no other state in the world now openly supports the illegal occupation of Namibia.² Nevertheless, while no country is prepared to admit support for the regime, South Africa has been able to maintain its occupation through the *de facto* support it has enjoyed in the West. In 1983–4 this was strengthened by a series of diplomatic successes for the then South African Prime Minister, P W Botha. These began with a secret agreement on security with Swaziland which led to the expulsion from that country of most of the active ANC (African National Congress) members resident there. Soon thereafter, Mozambique was battered into signing a public security pact in which, in exchange for the expulsion of ANC leaders from Mozambique, South Africa formally agreed to end its support for the Mozambique National Resistance (MNR). Attempting to use the same tactics against Lesotho, South African commandos launched an attack on homes in Maseru and its secret services began covertly supporting the Lesotho Liberation Army, an anti-government guerrilla group based in the Transkei bantustan. Lesotho refused to sign a security pact.

¹ The article was written in August and September 1985. We focus on the period 1983–5 to update and expand an earlier contribution by Randolph Vigne 'The Namibia file', *Third World Quarterly* 5(2) April 1983, pp 345–60.

² On 27 October 1966 the UN General Assembly revoked South Africa's mandate in Namibia. From that date its presence in the country became illegal. In 1969 the General Assembly decision was confirmed by the UN Security Council, and the illegality of the South African occupation was reaffirmed by the International Court of Justice in 1971.

Most important, however, from the point of view of the Namibian struggle, was an agreement between South Africa and Angola reached after a meeting in Lusaka in February 1984, in which South Africa agreed to end its occupation of a large area of southern Angola. Its withdrawal was to be completed in three months and to be monitored by a joint South African-Angolan force. South Africa's objective was to elicit an agreement from the Angolans to refuse guerillas of SWAPO's military wing, the People's Liberation Army of Namibia (PLAN) passage through the south of the country, in the hope that it would result in armed confrontations between PLAN and the Angolan army and sour relations between the Angolan government and SWAPO. Angola refused to sign such a pact, pointing out that the two countries had no common border and were in contact only because of the illegal occupation of Namibia.

Following the negotiation of agreements with Swaziland, Mozambique and Angola, South Africa sought to use these propaganda victories to project an image as a peace broker in southern Africa. Advocates of 'constructive engagement' held up the agreements as examples of the benefits of their approach, and the US claimed part of the credit by quietly acknowledging that it had put pressure on Mozambique and Angola to meet with South Africa and hammer out agreements. The final feather in Botha's cap was an invitation from his friends in Western Europe to make a tour of their countries in June 1984. Despite massive demonstrations in many European countries against this visit, South Africa regarded the tour as a triumph and the herald of a new era of acceptability in international circles.

The implications for SWAPO and Namibia were serious, as these events bolstered South African confidence that it could continue its occupation as before. In the course of his European tour, P W Botha had said of southern Africa: 'We are a regional power. It is our region.' South Africa was encouraged in its search for an internal settlement. US insistence on 'linkage', as well as the success of the carrot-and-stick approach in Mozambique, encouraged South Africa to increase its support for UNITA depredations in Angola. The prospects for peace seemed to recede further.

Political economy

The motivation of South Africa's three most consistent governmental supporters in the West, the US, Britain and the Federal Republic of Germany (FRG) were clear. These three were the core of the so-called

'Contact Group' (the other two were France and Canada—Germany had been the former colonial power). They were also the three countries (excluding South Africa) with the largest economic stakes in the country and in South Africa itself. This, together with strategic considerations and the fact that all three had their most conservative governments in decades (Reagan, Thatcher and Kohl) made them reliable partners in perpetuating the South African occupation.

Namibia's extractive colonial economy, developed for the benefit of foreign companies and white settlers, is in even deeper recession than South Africa's.³ The value of per capita output fell by over 20 per cent between 1977 and 1983 mainly because of the very high dependence on plummeting world commodity prices (90 per cent of goods produced are exported) in relation to prices of fuel, machinery and consumer durables (80 per cent of goods consumed are imported). This has been coupled with a long drought and a lack of investment confidence due to the ongoing war and political impasse. Unemployment is a staggering 40 per cent and inflation is 12 per cent and rising.⁴ The harsh effects of this on Namibia's black population are exacerbated by vast inequalities in income and wealth between black and white. Average income for the approximately 35,000 white households is some twenty times greater than for the 310,000 black households. Even the relatively new black middle class of civil servants, teachers and nurses, and 'Coloured' people in skilled manual jobs, comprising at most 50,000 households, earn per capita incomes of about a third of the white average.

Mining

Mining has been the largest source of foreign exchange over the post-war period, but the recent recession has driven down its share of GDP from about a third in the late 1970s to about a quarter in 1983. Mine employment fell from 21,000 in 1977 to 15,000 in 1984.⁵

The mining sector is dominated by just three companies which are mainly under mixed South African and British financial control.⁶ Diamond mining, at four locations on the extreme southern shores, is monopolised by Consolidated Diamond Mines (CDM), owned by the De Beers conglomerate, which is in turn part of the Anglo American

⁶ Catholic Institute for International Relations, *Mines and Independence*, London, 1983.

Corporation. Production has decreased in volume from 2 million carats in 1977 to 0.93 million carats in 1984, declared profits falling from R162 million in 1978 to R33 million in 1984. However, these figures have recently been shown to be highly misleading, in evidence to the Theron Commission of Inquiry into Malpractices and Misappropriation of Public Funds. The commission was set up in 1983 to investigate the rapidly deteriorating state of public finance in the territory.⁷ Evidence submitted indicates that CDM has been consistently overmining deposits and has greatly understated the extent of its production and of the selling price of its diamonds, 98 per cent of which are of gem quality. This has been possible because the quasi-state Diamond Board (run by De Beers personnel) has not provided adequate auditing or customs checks on diamonds exported from Namibia, and does not state the selling prices obtained by the Central Selling Organisation (CSO) in London (the CSO, also controlled by De Beers, is a cartel covering virtually all diamond sales and which has stockpiled massive quantities of Namibian gems in order to maintain world prices). The cover-up is assisted by the existence of an intermediary merchandising firm handling all southern African diamonds, the Diamond Purchasing and Trading Company (PTRA), another De Beers subsidiary, which exists only on paper but is paid 10 per cent of the total value of Namibian diamond production, a ploy designed to avoid profit tax in Britain. Between 1973 and 1980, CDM accounted for 47 per cent of De Beers' revenue but only 14 per cent of De Beers' carat production. It is alleged that huge transfer pricing by CDM has helped reduce its tax payments in Namibia from R163 million in 1978-79 to R33 million in 1983-84. Its contribution to Namibian state revenue has fallen from 40 per cent in 1980 to only 9 per cent in 1984.

This reduction in CDM's importance to state revenue is partly due also to the rise of tax revenue from the relatively new Rossing Uranium Ltd., whose majority shareholder is Britain's mining giant Rio Tinto Zinc (RTZ). Total of France, Urangesellschaft of West Germany and the state company Gencor of South Africa own smaller shares.⁸ Rossing has a capital of R1 billion and reserves sufficient for production to at least 1990. Here again, as the world market price for uranium oxide has steadily dropped, profits have fallen from a peak in 1982 so that by early 1985 they reached their lowest point for a decade. Rossing has had to

⁷ *Windhoek Advertiser*, 26 and 28 June 1985, 2 July 1985.

⁸ CIIR, *Mines and Independence*, op. cit.

renegotiate its secret long-term contracts with nuclear utilities in the major Western countries as a result. Company tax payments by Rossing were deferred between its first year of production in 1978 and 1983 to allow it to recoup all of its initial investment expenditure. Nevertheless, it paid R30 million in company tax in 1983, but kept the payment secret hoping to avoid international condemnation for such overt support for the illegal regime. Rossing has recently refused to give production figures at the RTZ Annual General meetings in London.

The third major mining company in Namibia is the Tsumeb Corporation Ltd (TCL), which is mostly owned by Gold Fields of South Africa Ltd (GFSa) (43 per cent) followed by the US firm Newmont (33.1 per cent) and then BP Mineral Services Ltd (14.5 per cent). Consolidated Gold Fields (Cons Gold) of the UK owns nearly half GFSa as well as 20 per cent of Newmont, so can have considerable influence over TCL. The South African multinational, Anglo American, in turn, holds a controlling share of Cons Gold. Tsumeb operates five base metal mines, mainly producing copper, lead and zinc and a large smelter, and is Namibia's largest private employer. The spell of low world base metal prices was, it was claimed, responsible for a loss of R8 million in 1984. However, once again, the Theron Commission heard evidence from the Department of Geological Survey that the metal ingots shipped abroad by TCL had never been analysed, despite the fact that they contained silver and gold. There is also some doubt that the TCL has provided adequate figures on the production of its secondary minerals—such as germanium dioxide, cadmium and arsenic.

While the big triumvirate of mining firms can afford to offer slightly better working conditions for black employees and is concerned to project a philanthropic image in Namibia by sponsoring some education projects, it has been widely criticised for plundering the country's irreplaceable minerals, financing the racist regime through a variety of taxes, and cooperating with the police and army.⁹

In April 1984 it was reported that the 'Kudu' gas field, 120 km off the southernmost Namibian shore and 2.8 km inside Namibian waters, could become a major commercial source of liquid fuel for South Africa. The field was known to exist from 1974 but recently the South African state-owned oil exploration company, Soekor, had encourage further development drilling in cooperation with the US-based Chevron

⁹ See, for example, Brian Wood, 'The militarisation of Namibia's economy' in *Review of African Political Economy*, 29 July 1984.

Oil Corporation. However, Chevron has said it won't participate further in development work on the 'Kudu' field because it is 'non-commercial'.¹⁰ While the reports are therefore mixed, it seems that Soekor are proceeding with further development work, most likely with other Western oil companies which have the necessary expertise. But great secrecy surrounds the project. A British bank, Samuel Montagu, are reported to be arranging finance for this work and Soekor are said to be keen to link the field up to a liquification plant based in South Africa so as to also service the potential Mossel Bay field.¹¹ South Africa's lack of any natural supply of liquid fuels and its vulnerability to an effective oil embargo, make the speculation surrounding the 'Kudu' project highly significant politically, if it is viable, since the Pretoria government would try to use this as another reason to delay or check Namibia's full independence.

Agriculture and fishing

Six years of drought in many parts of the country, depressed prices, and the war in northern regions have seriously affected agriculture (now about 8 per cent of GDP). Namibia has about 5,000 huge white-settler ranches, 20,000 small black-owned stock-raising households in the southern bantustans and 120,000 black households engaged in mostly subsistence mixed farming on just 5 per cent of the viable farmland in the far north.¹² The white settler farmers have always enjoyed state subsidies, but as their numbers have declined, the subsidies have increased to as much as R35,000 per ranch per year, even though their total debts topped R200 million in 1984. By contrast, so-called 'Coloured' farmers had their subsidies abolished in March 1985, most black stockholders in the south lost their animals to the drought and the most populous region in Namibia, Ovamboland, was so overcrowded and disrupted by the war that at least one-quarter of its food had to be imported.

The fishing industry was concentrated inshore and consisted of catches of pilchard, anchovy and rock lobster. It is, however, controlled by South African companies which overfished to such an extreme that the decline in fish stocks reduced the industry's share of GDP from 10 per cent in 1975 to 2½ per cent in 1984. Namibia does not yet benefit

¹² Richard Moorsom, *Transforming a Wasted Land*, London: CIIR, 1982.

from its offshore fishing potential where, within its future 200-mile zone (not proclaimed because of the illegal occupation) the fleets of 17 nations reap a total sales value from horse mackerel and hake which is even bigger than that of Namibia's diamond industry.¹³ Meanwhile, four-fifths of the workers in the fishing industry have lost their jobs since 1975.

Manufacturing

Manufacturing in Namibia is very small, only 6 per cent of GDP, and consists mainly of small food processing plants and workshops. Its growth has been restricted by South African industrial domination of the region. Even the small plants which exist have been hit by the recession, as have the construction firms.

Commerce and banking

The commercial and banking sector (one-third of GDP) is dominated by two jointly South African- and British-owned banks, Barclays and Standard Chartered, plus both British and South African insurance companies. Most bank funds are invested in South Africa (40 per cent of Standard's profits left the country in 1982-3) and expansion in the rest of the commercial sector has been severely limited by the racially structured consumer market and sharply rising sales tax rates.

State expenditure

The fall in tax revenue for the state administration due to the slump and drought has come at a time of severe political crisis (described in detail below). The South African authorities and their chosen proxies in the Democratic Turnhalle Alliance (DTA) tried to solve the political crisis by increasing state expenditure by 75 per cent between 1980 and 1983 the bulk of it on the ten ethnic administrations and on military-related infrastructure like roads in the north. With state spending suddenly running at almost 60 per cent of GDP, almost twice the sub-Saharan average, and state departments hopelessly straddling Pretoria, Windhoek, ten ethnic authorities and even more municipal authorities,¹⁴ an orgy of over-employment, mismanagement and corruption resulted, which the Theron Commission was called in to unravel.¹⁵ The shortfall in revenue was made up by accumulating a huge

¹³ Richard Moorsom, *Exploiting the Sea*, London: CIIIR, 1984.

¹⁵ *NNB*, September 1983.

loan burden, now in the region of R1,000 million, requiring annual repayments of about R185 million (and increasing as the Rand falls in value) out of an estimated expenditure of R1,177 million and revenue income of about R600 million. These sums are only balanced by subventions totalling R658 million from the South African state, made up mostly of direct grants and customs dues. The latter are really recycled revenues which an independent Namibia would get anyway, while the former, like the further R480 million grant for 'police and defence',¹⁶ are the price Pretoria pays to prop up a colonial system rejected by most Namibians. The R480 million grant for 'police and defence' expenditure did not nearly reflect the cost of the South African state's war in Namibia (and its extension into southern Angola). One British economist estimated the true cost at over R2 billion per year, 9 per cent of the entire South African state budget, and over R5 million per day.¹⁷ This huge indebtedness will be a major problem for an independent Namibia. Already SWAPO has stated that it will not repay debts incurred under South Africa's illegal occupation and it undoubtedly has a watertight legal case to renounce such foreign debts.

Repression and war

In April 1983, the Attorney-General in Namibia warned of a 'breakdown in law and order' due to the war, with 85 per cent of Supreme Court cases relating to crimes committed in the 'Operational Area' (war zone). At the same time, the Bar Council stated that it was 'shocked at the instances of abuse of detainees and rape or death in detention', which made up the majority of criminal cases in the Supreme Court.¹⁸ Yet the instances of South African-controlled war criminals being brought to court cannot be seen to reflect the extent of atrocities and violations of human rights. Many victims are either too poor, too unfamiliar with legal processes conducted in a foreign language, or too afraid of further victimisation, to report their experiences. In April 1985 a British clergyman, the Reverend John Wheeler, returned from a visit to Namibia and described 'a pattern of harassment which has bred tremendous fear'.¹⁹ Two Namibian bishops

in a letter to *The Times* (London) in 1984 similarly described how the South African-controlled terror squad *Koevoet* (Afrikaans for 'Crowbar') pillaged, raped, bayoneted and burnt people alive in northern Namibia. As a result, they wrote, the South African presence was not welcomed by Namibians: 'All personnel who come generally under the umbrella of South Africa . . . are regarded by most people as having no right to be there, and to some degree, as being the real "enemy"'.²⁰ Even the Bar Council in Namibia reiterated these sentiments in 1984, saying that the police and the entire judicial system were 'suspect in the eyes of the overwhelming majority of the people'.

The South African reign of terror is designed to paralyse organised resistance within Namibia, and includes severe restrictions on movement within the territory. The latter was exacerbated in 1985 by the promulgation of the new law, 'AG 28', preventing non-residents from entering the northern bantustans without police passes.²¹ The Prohibition and Notification of Meetings Act of 1981 has been used almost exclusively to prevent SWAPO meetings and rallies: it was even used to round up 34 SWAPO leaders at a barbecue in June 1985.²² The month before, the regime had announced its intention to use the act to prosecute three SWAPO members following celebrations in Windhoek's Katutura township to mark the movement's 25th anniversary.²³

War atrocities

The reality of mass support for SWAPO means that, in the eyes of the occupying armed forces, all black Namibians are potential enemies, resulting in atrocities so extreme that they defy imagination. In 1983, a 63-year-old man, Ndara Kapitango, was roasted on a fire by two soldiers of the South West Africa Territory Force (SWATF), who also raped his wife.²⁴ Brutality and sadism of this kind have become part of the culture of white rule, internalised in many cases by collaborationist Namibians recruited by the South African armed forces. Atrocities are not merely confined to the war zones, but, as was stated in the Appellate Division of the S.A. Supreme Court in 1984, are 'considered normal practices' by many white employers. These were the words of Mr Gart

Burger for the State, when he ruled that the six-year sentence imposed on farmer Jacobus van Rooyen for the murder of Kasire Thomas should not be increased. Van Rooyen killed Kasire Thomas, a short-term prisoner doing weekend labour on his farm, by brutally torturing him, chaining him at the neck and forcing him to give the SWAPO salute before he died of his injuries.²⁵ In 1983, after three SWATF soldiers raped a 62-year-old woman and brutally assaulted her husband, the State Advocate said that rape charges were increasingly prevalent, accounting for 42 per cent of cases in the Supreme Court.²⁶ The *Windhoek Observer*, one of Namibia's few independent newspapers, which dared to publicise accounts of incidents such as these, was banned in September 1984. It has subsequently been allowed to resume publication, its coverage of political developments in general and repression in particular severely curtailed. Although Pretoria continues to kill, maim, torture and terrorise Namibians, it is anxious to avoid the adverse publicity emanating from these policies.

Legal sanctions have increased the powers of the armed forces to detain, interrogate and even kill, and the police and the army have become virtually a law unto themselves. Eighty per cent of Namibians are now living under martial law. Because SWAPO's guerrilla war is so effective, and because the South African-controlled forces are seldom able successfully to confront PLAN in direct combat, the regime's forces are effectively waging a war against all Namibians, and civilians are easy targets. Similarly, discrediting SWAPO and trying to deprive PLAN of its popular base have become an integral part of South African military strategy.

In June 1983 an Inspector Nel of the police 'security' service, cross-examined during the trial of a SWAPO combatant, admitted that *Koevoet* members made a practice of disguising themselves as SWAPO fighters, and that the so-called 'Takkie Squad' of South African soldiers had used SWAPO boots and AK 47 rifles when committing assassinations.²⁷ Other trials of *Koevoet* members have also provided evidence of this tactic.²⁸ In one such trial, the court was told that *Koevoet* employs 'skilled interrogators' as well as 'specialist exterminators'.²⁹ In December 1984 *Koevoet* member Jonas Paulus told

a court that there was a system of bounty payments in operation in the war zone, including a reward of R2,000 for killing a 'guerrilla' (which has often meant a civilian).³⁰ Even the South African-sponsored Multi-Party Conference (see below) in the wake of adverse publicity abroad, has found *Koevoet* an embarrassment and indicated a wish to disband it. However, in April and May 1985 the South African Minister of Law and Order announced that its members might be 'seconded or transferred' to the South West African Police, but that the unit would remain intact and continue 'similar operations'.³¹

In its efforts to win an unwinnable war, the South African army has resorted to chemical warfare.³² In 1983, Angola accused South Africa of using 'paralysing chemical weapons' against Angolan troops and civilians, and in June 1984 the UN Council for Namibia said that chemical gases were 'repeatedly' used during SA operations.³³ Military takeover of Namibia's few social services has increased the scope for intimidation. The war itself is a major contributing factor to ill-health in Namibia, as evidenced in the 1983 outbreak of bubonic plague.³⁴ In October 1983, the regime announced plans for a complete military takeover of health services, aiming simultaneously to deny possible assistance to wounded SWAPO combatants, to push out the church mission services which have increasingly drawn attention to atrocities by the South African-controlled armed forces, and to promote its floundering public relations exercises. The presence of armed soldiers teaching in schools has been described by many young SWAPO exiles as a factor in school boycotts and decisions to escape into exile.³⁵ The inferior and inadequate education system has been disrupted even further through the war, which has led to the closure of some schools and greater under-resourcing of others.³⁶ Other ways in which the war has taken its toll on ordinary Namibians include forced removals of civilians from areas they have cultivated, the burning and destruction of crops, and South African army interference in water supplies. With forced removals resulting from military activities, squatter camps with desperately unsanitary conditions—those around Oshakati and

Ondangua alone housing over 6,000 people in 1983—have been created.³⁷

The militarisation of Namibian society has also limited the already narrow options open to workers. Job seekers have, historically, sought employment in the white-owned mines and industries of central Namibia. The necessity of migration southward has increased with the destruction, through war, of the economy of the north. In the 'white' urban areas, black workers today face not only police harassment and unemployment, but conscription into the army. Despite this, there is an increasing influx of 'illegals' into central Namibia, including hundreds of women, fleeing the violence of more intense warfare further north. Uncertainty and insecurity have thus become more intense for Namibia's population as a whole.³⁸

Conscription

The process of 'Namibianisation' of South Africa's war against Namibians has not been successful, despite recruitment of several thousand young Namibian men, driven into military service by poverty, unemployment and fear. A SWATF spokesman announced in 1984 that all attempts to avoid a South African registration of all potential conscripts to the military would be 'investigated' and threatened punishments of six months prison or a heavy fine.³⁹ All political groupings in Namibia, except the DTA, have opposed registration, and reports from SWAPO settlements indicate that the policy has led to an increase in the numbers of young men fleeing Namibia. Registration was suspended at the end of 1984, ostensibly to facilitate a review. Parents and teachers have protested against it, and the brave stand of a SWAPO member, Eric Binga, against conscription has highlighted popular opposition. Declaring himself to be a card-carrying member of SWAPO, Binga made a legal application against conscription. His father, Eduard Binga, supporting the application, explained that Eric's brother Ismail was a member of PLAN, and that the two brothers could not fight one another in a war which is 'the result of the unfair treatment our people are receiving in this country due to the laws of South Africa'. The appeal was dismissed in June 1984, but Binga's lawyers have reportedly applied for a higher-level appeal.⁴⁰ Hundreds of other young

Namibians lacking such access to courts had hoped that this case, heralded by the media in both South Africa and Namibia, as a 'historic' challenge to *apartheid* rule, would set a precedent alleviating them of the dilemma posed by conscription.

Political prisoners

The developing crisis in southern Africa, which has shaken the confidence of investors in the *apartheid* economy, has also increased the regime's sensitivity to international pressure. As anxiety over South Africa's conduct in Namibia has mounted, Western governments have sought to persuade it to modify some of its less popular practices. Overtures for the release of political prisoners by the British, American and other governments have been prompted by campaigns by the solidarity movements, which have been to significant effect in recent years. In October 1984, following a sustained campaign, particularly by activists in Britain and the US and lasting over six years, the prisoners of war taken during the South African raid on the Kassinga refugee camp in southern Angola were finally released.⁴¹ Responding to the growing anti-apartheid lobby in the USA, the US House of Representatives had passed a resolution calling for the release of Kassinga detainees, and for South African compliance with the UN Charter, the Universal Declaration of Human Rights and the Geneva Conventions of 1949.⁴²

While some Namibians, through their status as sentenced political prisoners, or because of having been a focus for international campaigns for other reasons, have been able to win their freedom from incarceration, hundreds more remain anonymous in detention centres, facing torture and possible death. As reference to statements of the Bar Council indicates, the notion of 'recourse to law' as a means to protect the rights of civilians is hardly applicable in Namibia.

Costs to South Africa

An article in the *Africa Contemporary Record* estimated South African troop losses in Namibia since SWAPO began its armed struggle in 1966 at 2,500,⁴³ while the total number of deaths in the Namibian war, the majority of them civilian, was estimated in 1983 at 10,000.⁴⁴ The economic cost to South Africa of the war in Namibia has been

⁴¹ *Rand Daily Mail* (Johannesburg) 18 and 19 September 1984; *SWAPO Information Bulletin*, December 1984, 'The Mariental detainees'.

⁴² *NNB*, October 1984.

⁴³ *NNB*, February 1985.

⁴⁴ *The Times* (London) 20 September 1983.

mentioned under 'Political economy' above. As the Rand plummets and Pretoria's indebtedness increases, with the entire apartheid economy in crisis in 1985, the financing of the war in Namibia becomes even more onerous. In addition to these economic factors, South Africa's white population is facing a crisis of morale, deepened by the disillusionment of its armed forces.⁴⁵ Many young white conscripts, caught in the contradiction between Pretoria's intention to retain its domination of Namibia and its hypocritical utterances about the need for self-determination, are unwilling to give their lives for South Africa's Vietnam.⁴⁶ In April 1983, for example, there were 355 men in South African Defence Force detention for refusing to undergo military training.⁴⁷

The enormous cost of the war to South Africa is in large part due to the effectiveness of SWAPO's armed struggle. For example, just one of SWAPO's 1983 bomb attacks in Windhoek, Namibia's capital, caused an estimated R60,000 worth of damage, although there were no casualties.⁴⁸ In October that year, the *Windhoek Observer* attributed the South African military's defoliation of a 600 metre swathe along a main highway in the north to 'increasing appearance of SWAPO insurgents in the area . . . [and] several attacks, most of them successful'.⁴⁹ A year later, SADF chief Viljoen was admitting that despite on-going 'counter-insurgency' campaigns, SWAPO combatants remained active in northern Namibia.⁵⁰ A SWAPO press release issued in the same month stated that seventy-one South African troops were killed and fifty-seven injured in July 1984. On 4 October 1984 the main water supply to 350 farmsteads in the north was cut by a bomb explosion. In February 1985, PLAN successfully shot down an Impala jet, derailed a goods train and bombed the post office serving the South African military base at Ondangua.⁵¹ PLAN regularly issues reports of its operations but these are not reported in the Western media.

South African military bases in northern Namibia have an additional function in Pretoria's regional strategy: they are used as a launch pad for

attacks on Angola and to provide logistical support and training for the Unita forces engaged in sabotage of the MPLA's thwarted attempts at national reconstruction. South African strategy in Angola is, in part, designed to undermine that country's support for Namibian liberation. In addition, however, it is part of a regional strategy for control, intended either to overthrow or to severely weaken independent states in the subcontinent with the aim of bringing them into South Africa's economic and political orbit. To this end, South African forces have been in continuous military occupation of parts of southern Angola since 1981, and have provided technical and logistical backing and even personnel for Unita raids as far north as Luanda and Cabinda. December 1983/January 1984 brought one of the largest South African offensives, following an MPLA warning of this threat in July 1983. The invading force consisted of around 10,000 troops, engaged in heavy bombing and shelling of several Angolan towns.⁵² The offensive had actually begun in August, in tandem with a Unita attack on Cangamba. Despite South African claims about the bombing of a 'SWAPO Headquarters' in December, not a single Namibian was killed, the attack being directed against the Angolan civilian settlements. The offensive was going on at the very time when South Africa was proposing at the UN a 'mutual force disengagement on the Namibia/Angola border as the first step in a peaceful independence settlement for Namibia.'⁵³ In January 1984, *Resister*, journal of the Committee on South African War Resistance, reported further evidence of the collaboration between Unita and the South African military, commenting on an article in *Soldier of Fortune* where an American mercenary described his training in Namibia and subsequent leadership, still under South African Defence Force command, of Unita forces in Angola.

In February 1984, following South Africa's 'disengagement' undertaking with Angola, a Joint Monitoring Commission (JMC), to monitor supposed South African troop withdrawal from Angola, conditional upon Angolan prevention of alleged SWAPO infiltration into northern Namibia from Angola, was set up. SWAPO, which had never been party to any ceasefire agreement with South Africa, despite the movement's offers to do so, continued its military operations within Namibia, arguing that these were launched not from 'bases' within

⁵² ANGOP statement, 1 January 1984.

⁵³ *N/NB*, Special Issue, January 1984.

Angola, but by combatants already infiltrated into Namibia and based among the Namibian masses. Ongoing SWAPO attacks were used by Pretoria as a justification for its delay in implementing the 'disengagement' agreement with Angola.⁵⁴ By May 1984, South African troops were still in Angola, the Angolan news agency ANGOP complaining of a massive influx of South African-backed Unita forces into the occupied areas.⁵⁵ In June 1984 President Dos Santos said that South African forces were still some 40 km inside Angola, and added that Unita saboteurs were still being infiltrated.⁵⁶

In October and November, as the occupation continued, the Angolan government reiterated its terms for a solution, as defined in 1982: withdrawal of South African forces from Angola, cessation of support for Unita; implementation of the UN independence plan as contained in Resolution 435; and phased withdrawal of Cuban forces from Angola when UN forces were in place in Namibia.

In January 1985 South African troops in Namibia held a major military operation, code-named 'Fist Showing' (Vuiswys) designed as a show of force and directed at Angola.⁵⁷ In April, South African forces claimed to have withdrawn from Angola, and the Joint Monitoring Commission was disbanded in mid-May. By this July, however, according to SWAPO sources, South African troops remained in Angola, having attacked Angolan forces up to 40 km inside that country at the end of June.⁵⁸ The debacle of the recent 'Unita' attack on Cabinda brought more evidence of South African involvement in actually manning Unita to headlines in the press all over the world.

Internal political developments

While SWAPO has escalated all aspects of its threefold strategy (armed struggle, internal political mobilisation and international diplomatic and economic pressure), to increase the costs to South Africa, the latter has pursued a counter-strategy of 'Namibianisation' of the conflict in an attempt to reduce those costs. At a political level South Africa's efforts have been directed to the creation of an anti-SWAPO third force. The existence of this third force depends upon Pretoria's ability to build a

repressive client state machine in Namibia. It hopes that this will either be strong enough to resist SWAPO altogether, or, at least, to weaken it sufficiently in elections to deny it effective control of an independent Namibia.

South Africa's first vehicle for an internal settlement was the DTA-dominated Council of Ministers which finally collapsed in ignominy in February 1983, brought down by its demonstrable lack of political support in the country, and by the corruption, incompetence and squabbling of its constituent parties and personalities.⁵⁹ Eventually, even South Africa decided that it had become counter-productive, and the Administrator-General (AG) of Namibia revoked the powers of the National Assembly and Council of Ministers and assumed direct rule by decree.

State Council

In July 1983 the AG announced the creation of a State Council with a brief to produce 'comprehensive proposals' for an 'interim government'. The proposals were to be submitted to him for approval and to be followed by a referendum to allow the electorate to choose between them and those contained in UN Security Council Resolution (UNSCR) 435. As with previous South African-sponsored elections, the objective was to attempt to legitimise, with a tightly controlled 'referendum', a new structure for proxy rule in Namibia which could be sold overseas as an acceptable alternative to the UN plan. The State Council was to have fifty-two members allocated according to the discretion of the AG and nominated by internal parties acceptable to South Africa. However, when even the DTA decided against involvement in the State Council, South Africa was forced to abandon the plan.

Multi-party conference

Instead it began to encourage a third initiative which followed the call, in September 1983, for a conference of seventeen small internal parties to formulate proposals for independence. Significantly, parties refusing to join the conference, whether on its right or left, were united in seeing it as an initiative from South Africa rather than from Namibians, as was claimed. SWAPO's Secretary for Foreign Affairs, Nico Bessinger, termed it 'Pretoria's latest neo-colonial scheme' designed to 'form an

⁵⁹ See Vigne, 'The Namibia file'. *op. cit.*

anti-SWAPO front', while the extreme right South West Africa Herstigste Nasionale Party (SWAHNP) dismissed it as an attempt to get the 'still-born State Council to arise from the dead'.⁶⁰

The Multi-Party Conference (MPC), as it became known, was finally launched on 12 November 1983 with, however, only seven participating parties: the DTA, the South West African National Union (SWANU), the Damara Council, SWAPO-Democrats (SWAPO-D), the Namibia Christian Democratic Party (NCDP), the Labour Party and the Rehoboth Liberation Front, none of which command mass support. While it was later joined by the SWA National Party (SWANP), representing most whites in Namibia, the NCDP soon left, attacking the DTA for working with the security police to crush opposition parties and expressing disquiet at the funding of the MPC by the Hans Seidl Foundation, an organisation closely associated with the right-wing Christian Socialist Union of the Federal Republic of Germany.⁶¹

In March 1984 South Africa released Andimba Toivo ya Toivo and other Namibian political prisoners in a transparent attempt to bolster the status of the MPC. Stating that the releases were in response to requests from the MPC, South Africa hoped that Ya Toivo and others, after eighteen years in prison, could be manoeuvred into criticism of SWAPO's leaders and used to create divisions in the liberation movement. However, Toivo declared his allegiance to SWAPO and support for its President, Sam Nujoma, and was subsequently elected its Secretary-General. As part of its new initiative, South Africa, in the same month, conducted what must be the most bizarre opinion poll ever. Troops rounded up 1,000 civilians in the Ovambo region of the north of the country. Holding them at gun-point, the soldiers then asked each whether they would vote for SWAPO or candidates of the 'internal parties' in an election. Each person was photographed and their name and answer recorded.⁶²

The MPC's decision to draw up a new constitution for Namibia to counter UNSCR 435 led to growing dissatisfaction within some of its constituent parties. In late March 1984 the Damara Council withdrew declaring its support for Resolution 435 and denouncing the MPC as an anti-SWAPO front. Opposition to SWANU participation grew among

⁶⁰ *Rand Daily Mail* (Johannesburg) 15 September 1983; *Windhoek Advertiser*, 3 and 5 October 1983.

⁶¹ *Action on Namibia*, 10 June 1985, 'Null and void: South Africa's internal settlement in Namibia'.

⁶² *Reuters*, 24 March 1984.

its members and came to a head when, at a special congress, the former leader, Moses Katjiuongua, was replaced and the party withdrew from the MPC. Katjiuongua refused to acknowledge his demotion, however, and with a rump of supporters remained in the MPC, still calling his group SWANU. Despite the fact that fourteen of a former eighteen SWANU branches backed the new president, Kuzeeko Kangueehi, and despite a High Court ruling that Kangueehi and his associates were the legal office-bearers of SWANU, South Africa continued to claim SWANU participation in the MPC under Katjiuongua.⁶³

The Lusaka talks

The immediate source of the SWANU split was talks involving SWAPO and South Africa (represented by the MPC) in Lusaka in May 1984. These were called by the Zambian President, Kenneth Kaunda, in an attempt to speed a settlement in Namibia. Kaunda agreed to host the talks without UN participation, a move potentially dangerous to SWAPO as it threatened to undermine Resolution 435. At the talks, however, representatives of the NCDP, the Namibia Independence Party, the Federal Party, the Damara Council and SWANU joined the SWAPO delegation to sit opposite representatives of the MPC led by Katjiuongua, a surprise development which SWAPO turned to its advantage. The talks foundered on the South African delegation's insistence on linkage and its refusal to agree to the immediate implementation of Resolution 435. They were a deep embarrassment to the South Africans, because they highlighted, once again, the breadth of SWAPO support compared to that of the South African-sponsored MPC. This was further strengthened by the later emergence of an informal alliance between SWAPO, the Damara Council and SWANU.⁶⁴ In September 1984, following the removal of its old-guard leadership, SWANU decided unanimously to work closely with SWAPO for the liberation of Namibia.

The 'transitional government of national unity'

Despite the setbacks for the MPC, the South Africans decided to press ahead with the formation of what was termed a 'Transitional Government of National Unity' (TGNU), based on the constitutional proposals formulated by the MPC in earlier sessions. A cabinet with

⁶³ *Action on Namibia*, 10 June 1985, 'Null and void', *op. cit.*

⁶⁴ *Africa*, June 1984.

eight members, three from the DTA and one each from the other five participating parties,⁶⁵ was nominated by the participants, along with sixty-two representatives sitting in an unelected 'Legislative Assembly' and a 'Constitutional Council' of sixteen nominated from the assembly. Despite claims that the introduction of the internal government constituted, in practice, a transfer of executive authority, South Africa retained control of all the most crucial portfolios. Foreign affairs and all international negotiations on Namibia remained the prerogative of the South African government, as did 'defence'. Control over finance was retained indirectly through control of the amounts voted by the South African parliament for Namibia which were essential to its financial solvency. 'Internal security' was retained in South African hands through the maintenance of secondments of South African personnel at the highest levels to the SWA Territory Force (SWATF-military) and the SWA Police (SWAP).⁶⁶

On its formation on 17 June 1985, the TGNU was very much the opposite of what its name was intended to imply. It was a collection of a few minority parties prepared to collaborate with South Africa. Sam Nujoma suggested that among them, the six parties commanded at the most the support of 80,000 of the 1.5 million Namibians, a mere 5.3 per cent of the population. It was announced that there would be no South African-sponsored elections prior to the formation of the internal government because it sought to promote 'national reconciliation'.

The MPC government was divided on almost every issue of importance to the Namibian people. Most importantly, there was disagreement on the appropriate attitude to the apartheid provisions contained in proclamation AG8, which laid down the basis for the eleven 'tribal' administrations of the second tier of government in Namibia. While some members said that the apartheid divisions would be abolished immediately, the SWANP made it clear from the start that it had decided to participate in the MPC specifically to defend white privileges and the separate administration and facilities for whites. Similar dilemmas with respect to repressive legislation and especially proclamation AG9 (allowing indefinite detention without trial), presented themselves from the start. While some black members of the MPC wanted to abolish these unpopular provisions, thereby trying to increase the popularity of the TGNU, other participants objected on

⁶⁵ These were SWAPO-D, SWANP, SWANU-Katjuongua, the Labour Party and the Rehoboth Liberation Front.

⁶⁶ *Action on Namibia*, 10 June 1985, 'Null and void', *op. cit.*

the grounds that such provisions would continue to be necessary for them to retain control in Namibia.

Divisions continued at the press conference after the launch ceremony, when Eben van Zijl, leader of the SWANP representatives, announced that he was strongly opposed to the abolition of the racial segregation of the education and health services, tax system and expenditure structure. The *Daily Telegraph* (London) described the eight 'ministers' at the press conference as putting up 'a defensive and semi-coherent response' to questions.⁶⁷

SWAPO political mobilisation inside Namibia

While the MPC struggled unsuccessfully to establish its credibility in Namibia, a series of major rallies held in the face of violent reaction by the security forces, demonstrated once again the extent of support enjoyed by SWAPO. On 19 April over 3,000 SWAPO supporters held a surprise rally in Katutura township outside Windhoek to mark the 25th anniversary of the formation of SWAPO. The thousands of demonstrators marched in a procession through Katutura singing freedom songs and hymns and were joined by others who flocked from their homes to join in. Police stayed in the background but were more in evidence when they used tear-gas to break up a second rally of 1,000 people on 4 May, called to commemorate the anniversary of the deaths of 600 Namibian refugees in a South African attack on a SWAPO refugee settlement in Kassinga, Angola. When SWAPO supporters turned out *en masse* at the third rally in Windhoek in two months, to protest against the installation of the TGNU, the police were even more brutal. Following a rally of 4,000 people, 1,500 who went on to march through Katutura were attacked by *Koevoet* with tear-gas and clubs. Thirty-three people were hospitalised as a result, many with serious injuries. South African attempts to mobilise a 'pro-MPC' demonstration, involving pressure from *Koevoet* and the laying on of trucks and buses to transport contract workers and school students to the ceremony, failed dismally.⁶⁸

With no Namibians on the streets to welcome the TGNU, it was left to the South Africans to put on a show of support. The swearing-in was marked by a massive military parade, including troops, tanks, armoured

⁶⁷ *Reuters*, 18 June 1985; *Daily Telegraph* (London) 19 June 1985.

⁶⁸ Speech by Hidipo Hamutenya, SWAPO Secretary for Information and Publicity, to Trafalgar Square Rally to commemorate anniversary of Soweto massacre, 16 June 1985, London.

personnel carriers, and *Koevoet*, which travelled through the black townships of Khomasdal and Katutura before ending up in the Windhoek city centre. It was seen by observers as a warning to black Namibians, and a reassurance to whites, that despite the internal government, South Africa would continue to keep a tight grip on the country.⁶⁹

International diplomacy and Namibia

From 1977 to 1983 the Contact Group virtually took over from the UN the role of negotiating a settlement in Namibia and it was an agreement hammered out by Contact Group representatives in 1977, and which South Africa and SWAPO agreed to in mid-1978, which formed the basis for UNSCR 435. For most of the period of its activities, the Contact Group gave the impression that independence was imminent, thereby discouraging other international pressures for South African withdrawal, and reducing Western support for SWAPO's call for mandatory economic sanctions against South Africa.

The demise of the Contact Group and the undermining of UNSC Resolution 435 have been the most prominent features of the recent period. The origins of this process are important to grasp if the subtleties of the present diplomacy are to be understood. In the build-up to, and following the election of the Thatcher government in Britain in early 1979, and again after the Mugabe election victory in Zimbabwe in early 1980, Pretoria began to back-track on Resolution 435 and to misleadingly present the UN plan to the world as somehow 'pro-SWAPO'. In fact Resolution 435 was a Western initiative to significantly water down in favour of Pretoria the UN's previous independence plan for Namibia contained in UN Security Council Resolution 385. The Western powers had agreed to this in 1976 when Portuguese colonialism was defeated and Soweto and other parts of South Africa were in revolt. Elizabeth Landis, an international lawyer who has worked closely in support of SWAPO for many years, summarised the watering-down of the principles of Resolution 385 as follows:

Despite its alleged purpose, Resolution 435 undercut every key provision of the earlier resolution: (i) Instead of being required to withdraw immediately, the South African occupation regime would remain in Namibia and run it until

⁶⁹ Namibia Communications Centre report, 18 June 1985; *Reuters*, 17 June 1985.

independence; (ii) Pretoria was not required to dismantle the bantustans, and other human rights requirements were omitted or made less comprehensive; (iii) The election would be run by South African officials—they would choose the electoral system, register voters, count the votes, etc.—while the UN would be reduced to monitoring their conduct; (iv) The same South African police that intimidated, detained, and tortured Namibians would be in charge of maintaining law and order and of ensuring the freedom of the vote; and (v) the removal of Walvis Bay from Namibian jurisdiction was tacitly approved.

To placate SWAPO, the Security Council adopted Resolution 432 (1978), which stated that the territorial integrity and unity of Namibia 'must be assured through the reintegration of Walvis Bay', [emphasis added] The Council added that it would support 'initiation of steps' to that end and that, pending the restoration, 'South Africa must not use Walvis Bay in any manner prejudicial to the independence of Namibia or the viability of its economy . . .' But the resolution contained no coercive provisions to ensure compliance by Pretoria.⁷⁰

Despite these huge concessions by SWAPO, who were nevertheless confident of winning any genuinely 'free and fair' election, Pretoria quickly took advantage of the election of conservative governments in Britain and the US to stall implementation of Resolution 435. A series of bogus issues such as alleged UN partiality, de-militarised zones, and election systems were raised between 1980 and 1983, delaying progress and subjecting Namibians to more suffering. The world stood by in ignorance of the subtle diplomatic manoeuvres or without effective power to end the delays.

When such negotiating ploys ran out, the issue of linking a Cuban troop withdrawal from Angola to the implementation of Resolution 435 was introduced by Pretoria with enthusiastic US connivance. While the stagnation of negotiations which followed had enabled Pretoria to continue its attempts to build the trappings of a local neo-colonial state and puppet government, the issue of linkage has provided Washington and Pretoria with a lever to promote the political fortunes of Jonas Savimbi's UNITA insurgents in Angola and to try to legitimise the illegal South African military attacks into Angola.

It was this which led to a heated falling out between France and the US at the last Contact Group meeting in Paris on 24 October 1983. In December 1983 the newly-elected Socialist government in France withdrew from the Contact Group. The External Relations Minister,

⁷⁰ Elizabeth Landis, 'Namibia in the international context: the frustration of independence', a paper delivered to International Conference on Namibia, London 10-13 September 1984 (organised by Namibia Support Committee in cooperation with SWAPO).

Pretoria, on the other hand, has begun to be increasingly open about its long-term objective to completely bypass Resolution 435. Hitherto it has always made a careful point of giving 'formal' acceptance to the resolution while expressing 'reservations' about certain of its terms. The South African Foreign Minister, Pik Botha, said in September 1984 that his government would not object to a plan which bypassed Resolution 435 and included agreement between the MPC, SWAPO and the Front Line States. Unita would also have to be brought in, he said, otherwise it would attack the UN peacekeeping force stationed on the Angola/Namibia border.⁷² Clearly, the South African government, spurred on by the US, will attempt further forays like the one in Lusaka to bypass the UN.

The abortive South African commando raid on the vital Gulf Oil installations in Cabinda in May 1985 and the savage attack on civilians in Gaborone in mid-1985 led to the temporary recall of the US Ambassador to 'review policy'. The picture was complicated, however, by the complete breakdown of US-Angola discussions on Cuban troop withdrawal which followed the provocative repeal on 10 July 1985 of the Clark Amendment in the US Congress. This amendment had formally prohibited US aid to dissident groups in Angola since the failure of the CIA's military-sponsored adventures with Unita and the FNLA in 1975. One of the major pro-South African and pro-Savimbi lobby organisations in Washington, Heritage Foundation, called the decision 'extremely historic' and Senator Steven Symms declared that 'what the South Africans are seeking to accomplish in southern Africa bears a resemblance to what the US is trying to accomplish in Central America'.⁷³

It remains an open question now whether the recent impetus amongst US Congressmen and Senators which has resulted from the domestic anti-apartheid campaigns can be sustained enough to force a halt to the Reagan Administration's increasingly open support for South Africa's surrogate, Savimbi, and its undermining of Resolution 435. A key component of this struggle will be the extent to which the British government can 'bridge' the irreconcilable US and Commonwealth positions, and so defuse world-wide pressure for effective economic and other sanctions against South Africa. The governments of Britain and the FRG are also playing an increasingly active role in softening anti-apartheid measures by the EEC. Clearly the anti-apartheid

Sanctions and South Africa .

This article sets out to describe and analyse the causes and effects of the phenomenal growth in the South African divestment campaign and the increasing calls for sanctions in the United States and other parts of the world.

The campaign in the US for the divestment of holdings by universities, churches, cities and States in companies with South African interests and for the ending of bank loans is by no means new. Church and other groups have been taking shareholder action at company AGMs for the past ten years, without any great success; though there has been a regular trickle of cities and States passing legislation to prohibit or at least to limit the investment of public funds in companies with South African interests, starting with the city of Cotati, California, in 1978. The first State action was taken by Nebraska in 1980, followed by Massachusetts, Connecticut, and Michigan in 1982.

The campaign, however, took on a completely new complexion at the end of 1984; it began to attract nationwide support and to have more marked success. Timothy Smith, a long-time campaigner and Executive Director of the Inter-Faith Center on Corporate Responsibility, commented, 'A number of banks have turned the corner on South Africa'.¹

Washington Notes on Africa (Winter/Spring 1985) lists a number of factors which led to the formation of the Free South Africa Movement, which was established at the end of 1984 to coordinate the efforts of political, labour, church and academic organisations and to spearhead the nationwide campaign:

Events in South Africa in 1984: the widespread unrest and police violence leading to over 200 deaths and 4000 arrests, centred around the imposition of the new Constitution;

The award of the Nobel Peace Prize to Bishop Desmond Tutu, which focused worldwide attention on apartheid;

The US Presidential candidacy of Jesse Jackson, which brought the issue of South Africa into the arena of national political debate;

The re-election of President Reagan, which brought the prospect of four more years of 'constructive engagement';

¹ *Rand Daily Mail* (Johannesburg) 10 April 1985.

The failure of the Export Administration Act, which included proposals for sanctions against South Africa and which was passed by the House of Representatives but defeated in the Senate;

The success of anti-apartheid action at grassroots level, which had been going on for many years.

The first major demonstration and arrests took place outside the South African Embassy in Washington DC on 21 November 1984. Since then demonstrations have taken place on every weekday, leading to the arrest (by August 1985) of some 3000 people, including twenty-two Congressmen and numerous other eminent people. The demonstrations have not been confined to Washington. As *Time* magazine (5 August 1985) commented:

More than any other issue since the Vietnam War, the question of apartheid has touched off a wave of public protest and voluntary arrest in the US that is far from being confined to Washington. While demonstrators have been taking to the streets of the capital others across the country have sought to pressure state and local governments, universities and colleges to rid themselves of holdings that involve US and foreign companies with interests in South Africa.

By August 1985, six States and twenty-six cities had passed some form of divestment legislation, while such legislation was pending in another twenty-five States and in numerous cities. Some forty universities had taken similar action, though in most cases, as is true also of some States, the divestment proposals were conditional upon the companies taking some action, such as achieving a satisfactory rating according to the Sullivan Principles (see appendix). The demands made by the Sullivan Principles, which are mainly concerned with desegregation and equal treatment in the workplace, have to a large extent been overtaken by events. Local South African businessmen are in fact making more radical political demands, such as common South African citizenship, repeal of the Pass Laws, and participation in national political life. Little is to be gained, therefore, from such conditional divestment.

In US usage, 'divestment' refers to the action of shareholders disposing of their holdings in companies; 'disinvestment' refers to companies withdrawing their capital from South Africa. Divestment is not an end in itself and it has no direct effect on South Africa. Its purpose is not to make the individual and institutional shareholders feel good, but to put pressure on the companies concerned to disinvest. This pressure is not purely financial; after all, others will no doubt purchase the shares disposed of. Although US companies derive only a proportion, and in the case of the giant multinationals only a very small

proportion, of their profits from South Africa, the damage done to their image by the exposure and criticism of their involvement in South Africa might well affect the profitability of their other operations. Companies might well decide therefore that, whatever the profitability of their South African involvement, their continued presence is not worth the effort. The campaign has at least succeeded in making companies spend a great deal of time and effort, which to them means money, on justifying their South African operations. As one US company executive observed, 'Although we get 10 per cent of our profit from South Africa, it's taking up 50 per cent of boardroom time.'²

According to *The Economist* (London) (30 March 1985) 'The total of sales of stock in South African-linked companies instigated by the anti-apartheid movement over the past year is probably past the \$5 billion mark'. How much effect this has had on the companies concerned it is impossible to gauge; though since 1980, thirty US companies have withdrawn from South Africa while only eleven have gone in. Others, like Ford and Coca-Cola have cut back their holdings in South African companies to less than 50 per cent. Even the British banks, Barclays and Standard Chartered, which have completely dominated the South African banking scene for decades have now reduced their holdings to well below 50 per cent. The companies themselves claim that their actions are based on purely commercial considerations. But those considerations are in turn determined by the political situation to which the campaign has been drawing attention for many years.

Most of the divestment has been carried out by city and State pension funds. (With a value of over \$1 trillion, US institutional portfolios are one of the largest sources of capital in the world, and they are now realising that this gives them a great deal of power). While the motivating cause has been disapproval of apartheid, the trustees have also been able to show that divestment from companies with South African interests is not financially detrimental to their Funds, as they must do in order to comply with the trust laws. The governor of the State of Massachusetts, which was the first State to divest completely from South African-linked companies, disposing of an estimated \$130 million worth of shares, commented, 'Divestment makes not only a strong moral statement against apartheid but divestiture has proven to

² *Financial Times* (London) 2 August 1985.

have had no significant impact on our pensions earnings'.³ Several studies have shown that portfolio performance would be no worse, and in some cases would be better, without South African involvement. Robert Schwartz, the leading exponent of socially responsible investment has written:

As an investment adviser, I do not analyze moral or political issues but rather concern myself with the hard data necessary to make responsible financial decisions. In the case of South Africa-related investments, the facts are clear. Divestment should not be ruled out on financial grounds. The final consideration is not its effect on your investment portfolio but its effect on apartheid.⁴

Some more cynical observers see this as reason for dismissing the campaign as simply an opportunity 'to redress affluence with a little nostalgic protest . . . any noble posture, so long as it's cost free'.⁵ But in challenging the conventional wisdom about the financial advantages of investing in South Africa the campaign is also challenging the political and moral assumptions on which that 'wisdom' is based.

There is very little real pressure on the companies voluntarily to withdraw completely from South Africa for anything resembling moral reasons. The campaign has, however, helped to create a political climate in which it was possible and politic for both Houses of Congress to pass legislation which would prohibit new investment and provide for some form of sanctions. In the House of Representatives fifty-six Republicans joined the Democrats in supporting an anti-apartheid Bill which would prohibit new loans to the South African government and state corporations, new investment, the sale of computers and nuclear technology as well as the sale of Krugerrands. The Senate agreed a milder package; at the time of writing it was expected that the two would meet shortly to coordinate their strategy and that they would agree on proposals for a limited form of sanctions which President Reagan, in view of the worsening situation in South Africa, would find difficult to veto. The US representative who met 'Pik' Botha on his European visit following the declaration of the state of emergency was reported as having told him 'that the "emotional climate" in the US would not permit the presidential veto unless there was "accelerated movement" towards the dismantling of apartheid'.⁶

³ F Chen, 'The financial implications of divestment: a review of the evidence', Interfaith Center on Corporate Responsibility, (hereafter ICCR), New York, 1984.

⁴ *New York Times*, 6 June 1985.

⁵ *Business Day*, 23 May 1985.

⁶ *Financial Times* (London) 12 August 1985.

Even the House of Representatives' proposals called only for an end to new investment in South Africa, which is presently insignificant and has been declining in importance for many years. Much of the growth of foreign investment has been attributable to the reinvestment of profits which, from 1960, in the wake of the Sharpeville massacre, until February 1983 when exchange controls were lifted, could only be repatriated at a discount of up to 40 per cent. Total foreign investment has in any event been shrinking in real terms for the past few years and US investment has fallen in absolute terms. It reached a high of \$2.8 billion in 1982 and fell to \$2.2 billion in 1984. During the whole of 1981 and 1982 no more than \$100 million of new US capital was invested. Since the abolition of exchange controls more money is leaving South Africa in the form of dividend payments than is entering for capital investment.

Companies invest in South Africa (as they do elsewhere) in order to make a profit; not in order to benefit the South African economy as a whole nor to improve the lot of blacks in particular. It can be argued *a priori* therefore that their withdrawal would harm them more than the South African economy or the black population. They will only withdraw when it is in their financial interests to do so, either because of the state of the economy or because public disapproval is affecting their profitability in other areas. Both these factors are already exerting some influence, as evidenced by the decline in new investment and the withdrawal of some companies. South Africa, while still a highly profitable field for investment in some sectors, particularly mining, is no longer the happy hunting-ground that it was until a few years ago. It was reported that Frost Sullivan, a New York risk consultant, had dropped South Africa from ranking as one of the safest of the world's economies to 'a par with some of the higher risk Third World countries'.⁷ The Investor Responsibility Research Centre in Washington states that 'From a 31 per cent after-tax rate of return during 1980, a particularly good year for the South African economy, American companies realised an average return of only 7 per cent in 1982 and 1983'. It is not surprising, therefore, that in the first quarter of 1985 R2.9 billion of foreign investment, more than the total for 1984, was withdrawn from South Africa.

Current returns on investment are not, however, the only consideration. Much of the foreign investment in South Africa is now in

⁷ *Sunday Times* (London) 28 July 1985.

the form of immovable assets which it would be physically impossible to remove and financially suicidal to dispose of locally. In any event, there is no reason to suspect that the South African government would hesitate to reintroduce exchange controls to prevent any major outflow of capital. Many companies are, therefore, obliged, in financial terms, to stay there however low the rate of return on their investments. Further, the major corporations have only a relatively small proportion of their assets in South Africa. A drop in the return on these will not have a dramatic impact on their overall performance. By staying in South Africa they not only hope, but are actively seeking to ensure, that the drop will be only temporary by ensuring that the present system survives.

Even in the unlikely event of the divestment campaign succeeding completely and causing all US companies to withdraw, the South African economy and apartheid would survive. It is true, as some opponents of disinvestment point out, that 'the divestment lobby is working on a tiny margin of the South African economy'.⁸ (The investment lobbyists, however, use contradictory arguments: they argue *against* disinvestment on the ground that foreign investment is so insignificant that its withdrawal would have no effect. On the other hand, when arguing *for* investment they claim that it has has a very significant effect and that its withdrawal would be most harmful to the black population.) But the arguments for disinvestment are not solely, nor indeed primarily, economic. They are political. What is needed in South Africa is radical political change. Foreign investment because of its nature helps to preclude that change, since its role is to preserve the present system. In doing so there is no way in which it can, as its advocates claim, benefit the black population, since it is that system which is the cause of the problems, not simply bad working and living conditions and the denial of human rights, which are the necessary consequences of the system.

The campaign, like the House of Representatives' proposals, is also concerned with ending bank loans, which, as the South African Finance Minister confirmed in March 1984 were 'becoming of relatively greater importance to South Africa than equity investment'.⁹ Eva Militz's work, *Bank Loans to South Africa Mid-1982 to End 1984*, 'identified a total of 202 banks of eighteen nationalities that provided ninety-eight new loans totalling US \$4244.1 million to the minority regime, its

⁸ *The Economist* (London) 30 March 1985.

⁹ *Financial Mail* (Johannesburg) 17 August 1985.

parastatal institutions and private companies'. US banks accounted for 27 per cent of this. Most of the leading banks now have a policy of not making loans to the South African government and its agencies; other have restrictive policies. The most notable 'convert' perhaps was Citibank, the world's largest private bank and the US's largest lender, which announced in February 1985 that it would no longer take part in loans to the South African government nor would it sell Krugerrands. Citibank had been subject to considerable pressure from the divestment campaign:

By March 1981 over thirty Protestant and Roman Catholic bodies had affirmed the pledge to buy no further bonds and CD's from Citibank. Other organisations like the famous Harvard University joined in and divested from Citibank. . . . the City of New York in 1984 began to withdraw pension money from banks and companies that deal with South Africa and a measure calling for further divestment was introduced in February 1985. . . . (Citibank is said to manage up to \$3 billion a year on behalf of New York.)¹⁰

Citibank's announcement was, therefore, hardly surprising or coincidental. Wells Fargo and the First National Bank of Boston have gone further and have said that they will also not make loans to the private sector in South Africa.

Partly, at least, as a result of the campaign, there has been a fall in US bank loans to the public sector from \$623 million in 1982 to \$343 million in September 1984. There has, however, been a dramatic increase in loans to the private sector; these could easily be channelled to the government and its agencies and it at least leaves other avenues open to them. US lending to private institutions other than banks increased from \$496.2 million in June 1981 to \$1.1 billion in September 1984 and lending to banks from \$1.08 billion to \$3.55 billion over the same period.

The stated aim of the Free South Africa Movement is the end of apartheid and a change in US policy. While it is already having some effect on the latter, its effect on the former is, and will remain, minimal, though not necessarily irrelevant. What North Americans mean by 'an end to apartheid' and what black South Africans mean by it are two very different things. Although the whole movement should not be dismissed, as it is by some of its more strident opponents, as simply a self-indulgent expression of 'bleeding-heart liberalism', it does tend to be little more than an extension of the US civil rights movement and to

¹⁰ See E. Militz, 'The International Campaign to end loans to South Africa', World Council of Churches, 1985.

treat apartheid merely as a particularly iniquitous form of denial of individual human rights based on racism. For black South Africans apartheid is a total politico-economic system which must be completely destroyed and not tampered with by the granting of 'concessions' concerning freedom of movement, trade union rights, etc. (Black political activists have tended for many years not even to refer to 'apartheid'; they speak of 'the system'.)

Many among both the proponents and opponents of foreign investment talk glibly about its positive or negative effects without showing any real understanding of what apartheid is or of the nature of the relationship between foreign investment and the apartheid system. If apartheid were simply about the practice of racial discrimination there would be equally valid, and insoluble, arguments for the use of investment as a carrot or disinvestment as a stick in order to persuade South Africans to change their ways. If apartheid were simply about separate park benches, separate shop entrances, separate schools, separate hospitals, separate buses, separate sports facilities—all on the basis of skin colour—it would still warrant universal condemnation. It is all that, but it is also much more. If that were all it was, the South African government could claim, as it does, that things were changing: there are now integrated hotels and restaurants (seventy-four and thirty-four respectively in the whole country) integrated sports teams (a token black has been chosen for the Springbok rugby team) and some integrated beaches (though swimming pools remain 99 per cent segregated).

South Africa is certainly racist. Racism exists not only on an interpersonal level as it does in most countries; it is institutionalised and even constitutionalised. Racism is enshrined in the social structures, the law and the Constitution. Their racial classification affects every aspect of people's lives: their right to vote, where they may live and work, whether they may live together as a family, the quality of their education, the size of their income and even where they may be buried.

Apartheid is not, however, simply about segregation. Social, geographic and political separation is only one of the many means used to achieve the aim of retaining economic wealth and political power in white hands. Apartheid means inequality and control. No one who is committed to the capitalist system would willingly forgo such an efficient method of protecting their material interests. Botha, Reagan and Thatcher possibly understand this better than some of the critics who are concerned only with the inhumanity of the means used.

Racial discrimination is never simply an end in itself. In South Africa it is a means towards the end of retaining political power, and consequently economic wealth, in the hands of the white minority. Apartheid and white economic development do not merely exist side by side; they have a symbiotic relationship. The South African government does not implement apartheid for purely ideological reasons, regardless of the economic consequences; it implements apartheid precisely because of these consequences, which are in the material interests of whites, including foreign investors. Apartheid, far from being a burden on the economy, has served it well. As F A Johnstone has noted:

Given the vast economic growth and industrialisation which has taken place in South Africa during the twentieth century, and given the concomitant continuity and consolidation of the system of racial domination, it clearly makes little sense to begin by characterising the relationship between this system and the economic system as essentially 'dysfunctional'. Still less sense does this view make in view of the extensive determination of the system of racial domination by property owners, notable in such forms of racial discrimination as the coercive labour controls of the contract system, the pass system and the compound system and the various discriminatory property laws.¹¹

It was foreign capital, mainly British, which enabled the gold and diamond mines, the foundations of the South African economy, to be developed in the first place. Such investment would not have been profitable, and therefore would not have been made, were it not for the existence of a vast, and extremely cheap, labour force. This labour force did not come into existence purely by chance; it had been deliberately created. There is nothing inherently exploitable about black workers. They were made exploitable by military conquest and the denial of political rights. They were forced to sell their labour *extremely* cheaply by the imposition of a tax when the only source of cash in an otherwise subsistence economy was working in the mines. Apartheid, albeit under a different name, served the interests of foreign capital from the start, and it continues to do so. Foreign investors are not, therefore merely engaging in the morally reprehensible act of benefiting from an evil system. They are an essential part of that system. They could not survive very profitably without it; it could not survive without them.

Although foreign investment now accounts for only a small proportion (3.8 per cent) of new fixed capital formation in South Africa the State President P W Botha, for one, is under no illusions about it

¹¹ Frederick A Johnstone, *Class, Race and Gold* London: Routledge and Kegan Paul, 197.

strategic importance. It was important he said, 'because it supplemented domestic savings to finance investment, favourably affected the balance of payments and often involved the transfer of technological know-how and sometimes the immigration of managers and highly qualified technical people'.¹² The basic contradiction of the apartheid system is that there is one economic system, which is dependent on blacks both as workers and as consumers, but a plural political system which denies blacks any effective power. The greater the economic dependence on blacks, the greater the pressure for a new political dispensation. To survive, apartheid must decrease its dependence on black labour and defuse the threat posed by the presence of blacks in 'white areas' by forcibly 'resettling' them. Foreign investment, because of its capital intensive nature, and, just as importantly, because of the 'technological know-how and highly qualified technical people' referred to by Botha, furthers this process and so lessens the pressure for political change. Disinvestment would obviously have the opposite effect.

While the withdrawal of foreign companies would have a deleterious effect on the small proportion of the workforce directly employed by them it would be beneficial to the majority since foreign investment destroys more jobs than it creates. The mechanisation of agriculture, for example—with the aid of foreign technology—has led to the 'resettlement' of 1.1 million blacks who were rendered 'superfluous' on white farms. As the South African economist Michael de Klerk has pointed out:

... instead of investing the lion's share of our capital resources in industrial jobs which cost R5400 each to create, we should be investing much more in small-scale agriculture where jobs cost perhaps one-tenth of that amount to create. Such a redistribution of land and capital would help increase rural incomes and so attract the men who are critically lacking in black agriculture back to the rural areas. Agriculture is also one of the few remaining areas of economic activity where labour-intensive techniques are still competitive. . . . The distribution of power and wealth in South Africa, and *our involvement in the Western economic system*, has caused our economy to develop along almost entirely contrary lines, and this is perhaps *the single most important cause* of the high level of structural unemployment in the Republic.¹³ (emphasis added)

He points out that among the causes of increasing capital intensity are

South African Institute of Race Relations, *Survey of Race Relations* 1983, p 109.
Charles Simkins and Cosmas Desmond (eds), *South African Unemployment: A Black Picture*, Pietermaritzburg: University of Natal Press, 1978, pp 37–8.

'the nature of foreign investment in the country' and 'the notion that development means using the latest overseas techniques'.

The argument for disinvestment, therefore, is not, or should not be, based on a moralistic self-righteousness; 'These people are so evil that we will have nothing to do with them.' Disinvestment and other sanctions should not, I believe, even be described as 'punitive'. Investors are necessarily party to the 'crime of apartheid'. The UN Convention on the Suppression and Punishment of the Crime of Apartheid states:

International criminal responsibility shall apply, *irrespective of the motives involved*, (emphasised added) to individuals, members of organisations and institutions and representatives of the State, whether residing in the territory of the State in which the acts are perpetrated or in some other State whenever they

(a) Commit, participate in or conspire in the commission of the acts mentioned in Article II of the present Convention;

(b) Directly abet, encourage or cooperate in the commission of the crime of apartheid

Among the acts mentioned in Article II is: '(e) Exploitation of the labour of the members of a racial group or groups, in particular by submitting them to forced labour.' Investors and other collaborators should, therefore, be concerned about their own 'criminal responsibility' in addition to that of the South African government. Refraining from incurring that responsibility is in one's own interests, not just a means of punishing others. By disinvesting companies do not simply wash their hands of the problem; they cease to play an important part in maintaining the system. To stop doing evil is a positive action. Disinvestment can only be viewed as a negative action if South Africa's racist policies are considered to have their own existence independently of the economic system. As we have seen, the only explanation for the apartheid system, both historically and in the present context, is in that it serves the political and economic interests of the whites. It is a contradiction in terms, therefore, to seek to change apartheid by participating in the present economic system. The 'Oppenheimer thesis' that economic growth, fuelled by foreign investment, necessarily lead to positive political change, has clearly been discredited by experience. Repression has steadily increased throughout a period of massive economic growth. Today, after 150 years of foreign investment there is in South Africa a state of emergency, widespread killings and arrests, and treason trials; the position of blacks is worse than it has ever

been. The cosmetic changes that have been introduced have served only to entrench white rule; the new Constitution and the tricameral Parliament are prime examples of this. Foreign investment certainly makes a contribution to economic growth, a bigger one than those who seek to minimise its role so as to justify their continued presence there will admit. According to South Africa's Finance Minister, Barend du Plessis, 'South Africa could manage long-term growth of about 5.5 per cent a year with the help of heavy foreign investment. But if the country has to manage on its own resources, its viable growth rate is about 3.5 per cent a year.'¹⁴ But there is no evidence of blacks benefiting from that growth. Disinvestment would change the nature rather than the extent of the growth, but at the same time, by increasing the dependence of the economy on black labour rather than foreign capital, it would heighten the basic contradiction of apartheid. How that contradiction is resolved is a question for black South Africans.

The pro-investment lobby would have us believe that any form of external pressure on South Africa is counter-productive because such is the Afrikaner mentality that they would react like cornered animals. Apart from being a blatant example of Anglo-American arrogance and racial stereotyping, the argument is clearly false. Even Dr Verwoerd, the architect of Grand Apartheid and the most doctrinaire and intransigent of all Afrikaner leaders, admitted that he had to bow to foreign pressure. When introducing his plan for separate 'homelands' in 1962, he said in Parliament, 'This is not what we would have liked to see. It is a form of fragmentation that we would not have liked had we been able to avoid it. In the light of the pressure being exerted on South Africa, there is however no doubt that this will have to be done, thereby buying for the white man his freedom and the right to retain his domination in what is his country'. There is also a warning here. Verwoerd was not prepared to be diverted from his primary aim; he was only willing to adapt the means of achieving it in order to placate foreign opinion. Botha has been adopting the same strategy. In his policy speech of August 1985 he made it quite clear that he had no intention of sharing effective political power with blacks, but he did at least feel constrained to make the effort, bungled though it was, to respond to overseas pressure. He knew that the measures would be dismissed by blacks and had he been addressing his own supporters he would have made the speech in the Transvaal and in Afrikaans rather than in Natal

and mainly in English. This, however, is an argument for applying more pressure not less. More recently, the mere threat of very limited sanctions sent the Foreign Minister, 'Pik' Botha, scurrying to Europe to assure the US, Britain and West Germany of P W Botha's good intentions.

The Nationalists themselves are well aware of both the political and economic importance of foreign investment. They go to great lengths to encourage it; and to even greater lengths to discourage the advocacy of disinvestment. They realise that the more Western capital, in the form of bank loans and direct investment, that is tied up in South Africa the greater the West's interest in giving them political support. It is concern for the protection of these interests, rather than any concern about the effects on the black population, that leads one or other of the major powers inevitably to veto any action against South Africa proposed by the UN. (It is for this reason that disinvestment by companies of North American, British and French origin is of primary importance. Even if companies from other countries, such as Japan, Israel, etc, were to take their place; these countries could not acquire a vested interest in exercising a veto which they do not possess.) The advocacy of disinvestment by a South African, even if it takes place outside South Africa, is defined by the Internal Security Act as a crime of 'subversion', carrying a maximum penalty of twenty years imprisonment. This consideration alone should dispel any argument about which section of the population benefits from such investment. Even those black workers employed by US companies and who thus have their own vested interest in foreign investment recognise that it is the government and the whites who benefit most. A recent survey of such workers which has been widely quoted as showing that 71 per cent of them favoured foreign investment also showed that only 26 per cent considered that it helped blacks, while 44 per cent thought it helped the government and 30 per cent the whites.

Disinvestment would, therefore, have some economic impact; though a different one from that usually suggested by either the proponents or opponents of investment. The question is not whether foreign investment is of direct economic benefit to blacks or not, but whether it contributes to political change. Disinvestment, despite its relative insignificance in narrow economic terms, would remove an essential prop to the system and allow blacks greater opportunity, because of the system's increased economic dependence on them, to exert pressure for political change. In more basic terms, blacks do not

need Westerners to hold their hand, but it would help if we got off their backs. Nobody claims that disinvestment alone would bring about radical political change in South Africa, but not only does it make its own contribution, it also prepares the way for other actions, particularly for more wide-ranging sanctions, since Western countries would then have less to lose as a result of such actions.

Even if it is accepted that total disinvestment will not take place, certainly not if it is left to the companies themselves, the campaign still has some validity. On the psychological level, it is a gesture of solidarity with, and a morale boost to, black South Africans who are the primary agents of change; while it has the opposite effect on the white supporters of the system. Despite what the amateur psychologists in the investment lobby say, white South Africans, whether Afrikaners or English-speaking, *are* concerned about being treated as pariahs. The fact that black political leaders, with the exception of Chief Buthelezi, have consistently called for such action should in itself be a sufficient justification for the campaign. All concerned might do well to show more trust in the judgement of those who are in the forefront of the struggle.

The campaign also helps to create the right political climate for government action against South Africa. The leader of a black-led lobbying group in Washington, for example, was quoted in *Time* magazine as saying, 'Many Americans knew nothing about apartheid before the demonstrations began. Now there is a new understanding of South African repression.' Such an understanding is a necessary, though by no means sufficient, prerequisite for government action. Without the campaign there would not even be the present threat of sanctions, which has been sufficient to have some influence on Botha's promise of future reforms. If, as anticipated, Reagan does approve some form of limited sanctions it will be an important political gesture and will put pressure on Britain at least to make a similar gesture. And at the moment nobody is really talking about anything more than a gesture. Effective sanctions are not yet even on the agenda in the US or Britain or for that matter in any Western country. The divestment campaign has at least put the issue of South Africa on the agenda.

The disinvestment campaign has not been confined to the US, though it is probably better organised and has more resources there than elsewhere; and for the first eight months of 1985 the US was certainly the dominant force in the campaign. There were, as has been mentioned, a number of reasons for this, some positive some negative,

and its importance both in relation to bringing about change in South Africa and to influencing the rest of the world should not be exaggerated. The widespread support given to the campaign in the US has doubtless added impetus to the campaign in other parts of the world, but the only real question is whether US policy will have any influence on British policy. Some countries, however, were already ahead of the US, while others, in the wake of the declaration of the State of Emergency, have leap-frogged over them.

India severed all economic links with South Africa as long ago as 1947. The South African Minister of Economic Affairs reported to the House of Assembly in 1962 that boycotts of South Africa had been imposed by the USSR, China, Malaysia, Antigua, Barbados, Jamaica, [British] Guyana, Suriname, Ethiopia, Ghana, Liberia, Nigeria, Sierra Leone and the Sudan.¹⁵ Other countries have imposed more limited sanctions: Norway decided in 1976 not to grant foreign exchange licences for investment in South Africa; Sweden banned new investment in 1979. Following the declaration of the State of Emergency on 20 July 1985, Canada, Australia, and all the members of the EEC, with the exception of Britain and West Germany, took some action. Brazil, which has a balance of trade surplus with South Africa, prohibited the export of arms, crude oil and petroleum derivatives and banned all social and cultural contacts. The most significant action was that taken by the French government which withdrew its ambassador and banned new investment. French new investment is very small, less than \$15 million in 1984; nothing was said about its far more extensive trading links.

The divestment campaign is primarily a politicising and mobilising force; any disinvestment it achieves, and it is having some success, is a bonus. Effective action can only be taken by governments; and really effective action by the UN by means of comprehensive mandatory sanctions. An overwhelming majority of member States of the UN are in favour of at least some mandatory sanctions, beyond the existing mandatory arms embargo. In 1979 the General Assembly passed a resolution calling for a cessation of new investment: 'The General Assembly, convinced that a cessation of new foreign investment in, and loans to, South Africa would constitute an important step in international action for the elimination of apartheid, as such investment

¹⁵ C' Child, 'Apartheid, economic collaboration and the case for United Nations comprehensive sanctions against South Africa', UN Centre Against Apartheid, 1984.

and loans abet and encourage the apartheid policies of that country . . . urges the Security Council to . . . achieve the cessation of further foreign investment in, and financial loans to, South Africa'. The Security Council has yet to impose such a moratorium.

Regular calls for mandatory sanctions are made in the General Assembly. In the 1984 vote there were only two votes against (compared to sixteen in 1983) and ten abstentions. In July 1985 not even Britain and the US vetoed the Security Council resolution on voluntary sanctions; though they had used their veto on an earlier one calling for mandatory sanctions.

In the past the South African economy has been considered impervious to sanctions, with the possible exception of oil, but in recent years it has become increasingly vulnerable. In 1982 and 1983 the economy experienced 'negative growth'. Despite some growth in 1984, the index of leading indicators fell 17 per cent in January and 13 per cent in February 1985; the prime borrowing rate of interest was 25 per cent in mid-1985, while inflation was at 16 per cent. The international finance community's disappointment with Botha's policy speech in August 1985 was reflected in the fall of the rand to a record low of \$0.38 compared to \$1 a year previously. In the past South Africa has had no difficulty in repaying loans since the international banks were always willing to make further loans because of their faith in the strength of the South African economy. Political factors have now changed that. On 27 August 1985 the Governor of the South African Reserve Bank in his annual report gave a number of reasons for the economy being in better shape than it had been in the previous year. Yet later that same day the Finance Minister announced the closure of the foreign exchange and shares markets. Four days later South Africa froze repayment for four months of \$12 billion of short-term loans out of a total foreign debt of \$17 billion. As the *Financial Times* (2 September 1985) commented, 'the crisis was brought about almost entirely by political rather than economic pressures'.

Even before the most recent unrest, South Africa had been described as being 'in the grip of a financial and economic crisis'. (M N Naidoo, unpublished paper) Naidoo points out that in 1984 South Africa devoted at least 27.8 per cent of its budget to defence, much of it going towards meeting the extremely high costs of the illegal occupation of Namibia, and a further 18 per cent on oil because of the high cost of its oil-from-coal process and the 'incentive payments' it has to make in order to circumvent the OPEC oil embargo. There were also other

factors, as Militz points out, including the prolonged drought, the fall in the gold price and the rise of the dollar. The myth of South Africa's economic invulnerability has therefore been shattered. If UN mandatory economic sanctions were added to all these other factors there is no doubt that the economy would be crippled, though obviously this would not happen overnight. The object of the exercise, however, is not to bring economic chaos but political change. And this, not by frightening the Nationalists into agreeing to such change but by making it impossible for them to retain the necessary political control which relies on Western economic and political support. Without that support the nationalists could not continue to exclude blacks from the political process while at the same time becoming more economically dependent on them.

An end to bank loans and investment would, as has been noted, have some impact, though only a minor one. The main area in which such action would be effective remains that of oil. South Africa claims that half of its oil needs are now met by its oil-from-coal process at its Sasol plants, 'but it appears that figures are inflated to boost white morale. Only 18 per cent of the country's oil needs are provided by the Sasol plants'.¹⁶ Despite the oil embargo imposed by all the OPEC countries, South Africa continues to import 200,000 barrels of oil per day; without this, in addition to the effect on industry, the defence force and the police would simply not be able to function. A ban on the export of technology, particularly computer and nuclear technology, would also have a major effect. The Managing Director of Burroughs, South Africa, has said, 'The economy would grind to a halt without access to the computer technology of the West'.¹⁷ South Africa's nuclear programme—there is no doubt that it has the capability of producing nuclear weapons and has most probably already done so—depends particularly on French collaboration in supplying materials and on the recruitment of British scientists. These actions alone would have a major impact, but to make a significant contribution towards real change in South Africa sanctions need to be not only mandatory but also comprehensive. Both politically and morally if some sanctions are effective and right, any collaboration is counter-productive and wrong.

The only obstacle—and at present it appears to be an insuperable

¹⁶ D Woods, *Apartheid—The Propaganda and the Reality*, London: Commonwealth Secretariat, 1985.

¹⁷ S Baldwin *et al.*, *Pension Funds and Ethical Investment*, New York: Council on Economic Priorities, 1980.

one—to the imposition of UN mandatory sanctions is the use of the veto in the Security Council by Britain and/or US or possibly even by France. Both the US and Britain are concerned only with modifying apartheid, with smoothing off the rough edges so that it will be 'acceptable'. They would prefer a capitalist South Africa, even if it is racist, to a non-racist one which is also likely to be socialist. Both countries, but particularly Britain, would also incur financial losses from the imposition of sanctions. The likely US ban on new investment, for example, would affect fewer than 300 companies, whereas a ban on all trade would affect 5700. The US is South Africa's largest export market, with Britain fourth; they are second and fourth respectively as sources of South Africa's imports. In relation to its total economy the US involvement with South Africa is insignificant; its imports from South Africa, for example, account for only 0.78 per cent of its total imports. Even its supposed dependence on South African minerals is grossly exaggerated:

The sub-committee on Africa of the Foreign Relations Committee of the United States Senate, under the chairmanship of Senator George McGovern, published in 1979 a two-year survey of America's dependence on South Africa's minerals. This survey showed such dependence to be substantially one of habit rather than necessity: alternative sources of key minerals existed in Australia, Brazil and other countries. It was later pointed out by Robert S McNamara that it would be in America's interests to develop such alternative sources. Evidence before Congressional and other committees of enquiry had indicated that in some sectors the West's own mineral development has been stultified by the long-held belief, fostered by the South African lobby, that only the South African grade of the relevant mineral was suitable for American industrial and military needs. Chrome is an example.¹⁸

In Britain's case the links are relatively far more significant. Britain's £5 billion of direct investment in South Africa represents 10 per cent of its total overseas investment and combined with its indirect investment of at least £6 billion provides some 45 per cent of foreign investment in South Africa. According to the United Kingdom South Africa Trade Association (UKSATA), a body not entirely devoid of its own vested interests, gross income for Britain from South Africa in 1982 was around £3.5 billion. UKSATA also maintains that breaking all links with South Africa would result in the loss of 250,000 jobs in Britain. Others (see Rogers and Bolton *op. cit.*) say that this is a gross exaggeration and that the figure could be as low as 10,000. Rogers and

¹⁸ Woods, *op. cit.*

Bolton also confirm the findings of the US inquiries about the availability of other sources of minerals and the possibility of other minerals being substituted. Further, in recent months there has been a growing body of opinion, especially within the British Labour Party, that one of the major causes of unemployment in Britain is the lack of capital for investment in industry as a result of the increase of overseas investment. Withdrawal of investment from South Africa could, therefore, provide capital for the creation of employment in Britain and thus offset any job losses which would result from other forms of sanctions.

As long as a Conservative government remains in power there is no likelihood that Britain would support mandatory, comprehensive UN sanctions. The Labour Party, is committed to sanctions, though nationalist elements within it might balk at comprehensive sanctions for which Britain would have to pay a price, at least in the short term. In any case, one veto is sufficient to prevent the imposition of mandatory sanctions; there is no doubt that the US would provide this. Public opinion in the US is undoubtedly in favour of improvements being made in South Africa and, as I have said, this will surely lead to the imposition of minor sanctions, which in turn will have some influence on 'reform', but it is not likely to support the overthrow of a white capitalist government in favour of a predominantly black socialist one.

Despite its widespread support and its limited success, there is an obvious danger that the divestment and sanctions campaign may be hijacked, if it has not been already, by those who have a vested economic and political interest in South Africa staying within the capitalist fold. The primary aim of US policy is to prevent South Africa, and with it ultimately the whole of sub-Saharan Africa, from falling within the communist sphere of influence. It has been seeking to do this through 'constructive engagement', but it would be willing to use other means, including limited sanctions, in order to achieve it. In other words, the campaign could be used as a means to enable the US to determine the nature, and control the pace, of change in South Africa.

Change will eventually come in South Africa, with or without the aid of sanctions. Sanctions are not, and never will be, the dominant factor. Although Reagan and Thatcher will doubtless remain deaf to mounting international call for stringent, even comprehensive, sanctions, the call in itself, as we have seen, has important psychological, political and economic effects. It may be a case of taking part being more important than winning. Nevertheless, the stronger the sanctions that are applied

the more they may hasten the day and possibly lessen the bloodshed. If those countries, particularly African ones such as Nigeria, which support sanctions were to make their own trading and other links conditional upon countries severing all links with South Africa, even the major powers might find that the cost of maintaining such links is greater than the cost of sanctions. Even in terms of their own self-interest, the rest of Africa combined is more important to South Africa's trading partners than South Africa alone. The complete isolation of South Africa is, therefore, not possible on economic grounds. But America has shown in the past that it does not count the cost, in terms of money or even lives, of combating what it perceives to be the threat of communism. There is no evidence to suggest that a predominantly black South African government would be communist, but Reagan and others will doubtless believe Pretoria's propaganda which labels everybody who calls for radical change in South Africa as a 'communist'.

The longer sanctions are delayed the more irrelevant they become; all the arguments will be drowned in the sound of violence. Black South Africans are quite clearly not sitting idly by waiting to see what contribution the West is going to make before they begin the revolution; they have already started without us. If trading and other links are as important as the pro-South Africa lobby maintains it will be imperative to have those links with any future government in South Africa. It could, therefore, be argued *ad hominem* that it is in the West's own best economic interest to impose mandatory, comprehensive sanctions now, whatever the cost; otherwise it will lose even more when South Africa goes up in flames and subsequently a predominantly black government, which is not interested in maintaining links with those who found it so profitable to collaborate with their oppressors, attains power.

Appendix

1) Notes on the Sullivan Principles:

Leon Sullivan, a black American preacher and now a director of General Motors, first published his code of conduct for US companies in South Africa in 1977; it has been amplified on a number of occasions since then. It consists of six basic principles:

- I Non-segregation in all eating, comfort and work facilities.
- II Equal and fair employment practices for all employees.

III Equal pay for all employees doing equal or comparable work for the same period of time.

IV Initiation of and development of training programs that will prepare, in substantial numbers, blacks and other non-whites for supervisory, administrative, clerical and technical jobs.

V Increasing the number of blacks and other non-whites in management and supervisory positions.

VI Improving the quality of employees' lives outside the work environment in such areas as housing, schooling, recreation and health facilities.

The 1984 revision added some points on 'Increased dimension of activities outside the workplace', including support for freedom of movement and for the recension of all apartheid laws.

Peru's Alan García: supplanting the old order

In April and July 1985 two notable events occurred in Peruvian politics. On 14 April the nation's oldest political party, the Alianza Popular Revolucionaria Americana (APRA), or American Popular Revolutionary Alliance, finally won a general election under its own name sixty years after its foundation. Then on 28 July the outgoing president, Fernando Belaúnde, handed over the presidential sash to APRA leader Alan García. Not since 1912 had a democratically elected government managed to avoid being ousted by a military *coup d'état* before its term in office had expired. This article examines the background to these events, commencing with an analysis of certain important political developments in the period leading up to the April hustings. It goes on to describe the campaign strategies and performance of the four major political groupings contending for power. Following this, an analysis of the election results is made. Finally, the programme and perspectives of the new APRA administration are discussed.

The decomposition of Acción Popular as a political force

After a decade in exile during the military governments led by Juan Velasco and Francisco Morales Bermúdez, 1980 saw ex-president Fernando Belaúnde stage a remarkable political comeback. In the May elections of that year, he garnered 45.4 per cent of valid votes cast for the presidency, while his party, Acción Popular (AP), obtained 40.9 per cent and 39.6 per cent of legitimate votes polled for the Senate and House of Deputies respectively.¹ Such widespread support placed AP far ahead of rival political groupings, and on 28 July 1980 Belaúnde assumed the presidency for the second time. Coming as it did after twelve years of military rule, the new administration enjoyed a honeymoon period of six months and was able to register further successes in the municipal elections held on 23 November 1980.

¹ Jurado Nacional de Elecciones, *Resultados de las elecciones presidenciales de 1980*, Lima 1982.

I am grateful to Geoffery Hawthorne and Rory Miller who passed comments on an earlier draft of this article. The usual disclaimers apply.

Nationally, AP emerged as the predominant political force in the municipalities, receiving 35.7 per cent of the vote.

Unfortunately for Belaúnde and AP, twelve months later these levels of popularity plummeted as expectations raised by the change-over from military to civilian rule were dashed. Central to this political transformation was the administration's inept handling of the economy. Belaúnde appointed international financier Manuel Ulloa to the key posts of Prime Minister and Finance Minister. Ulloa then formed a team, known as 'The Dynamo', of young technocrats and bankers trained in the US and firmly within the neo-classical tradition. This group started to implement policies that they hoped would convert Peru into a South American Taiwan. Tariffs were lowered with a view to increasing the international competitiveness of Peruvian manufacturing industry. The Dynamo also made efforts to expand Peruvian raw material exports. To assist export promotion, a policy of continuous mini-devaluations was introduced; denationalisation and the cutting of subsidies on basic commodities also formed part of their monetarist package. Attempts to attract additional foreign investment through a relaxation of regulations governing the remittance of profits were also pursued.²

Nevertheless, a thoroughgoing monetarist project on Chilean lines was not forthcoming due to divisions inside AP. In contrast to his economic team, President Belaúnde still hankered after the 'developmentalist' goals that characterised his first administration between 1963 and 1968. This position was supported by many influential politicians inside AP, especially the provincial parliamentarians that oscillated around Javier Alva Orlandini. Due to these pressures, state investment in infrastructure, especially roads, hydro-electric installations and large-scale irrigation schemes inherited from previous military regimes, initially increased.³ Given that the Dynamo were opposed to acquiring the cash to pay for this expenditure through taxing businesses, the government resorted to raising additional foreign loans, printing money and collecting revenue from higher taxes on domestic petroleum sales.

By chance rather than design, the economy registered a mild recovery amounting to 3 per cent of GDP in the financial year 1980–81, thanks largely to a 12.7 per cent increase in agricultural production as the

² The best general introduction to Peru during this period is the Latin America Bureau's, *Peru Paths to Poverty*, London 1985. Also see J Petras, M Morley and E Havens, 'Peru: capitalist democracy in transition', *New Left Review* (142) November–December 1983, pp 30–53.

³ Latin America Bureau, *Peru*, pp 79–80.

countryside recovered from the previous year's drought. The construction industry also registered an 11 per cent growth, an upsurge partly stimulated by state-backed development projects.⁴ But the contradictions inherent in the government's commitment to monetary control on the one hand, and state spending on the other, could not lie dormant for long. Efforts by monetarists inside the government to curb Belaúnde's desire to be a spending president had by the end of 1981 proved unsuccessful. Public works projects and continued high expenditure on arms helped to push up the foreign debt from US\$9,594 million in 1980 to US\$11,340 million in 1982. Over the same period, central government deficits rose from 2.8 per cent to 3.9 per cent of GDP.⁵ Higher foreign borrowing was resorted to because of a shortage of foreign exchange. In the first place, export earnings fell due to a steep reduction in commodity prices in 1981: taking 1976 as a base year, the terms of trade index stood at 120 in 1980, but fell back to 100 in 1981 and 86 in 1982. Simultaneously, the cut back in foreign earnings was exacerbated by the reduction in CERTEX subsidies on non-traditional exports forced through by the Dynamo.⁶

If Belaúnde's public works Keynesianism acted to heighten economic difficulties, the monetarist policies pursued by the neo-classical element in the government rapidly led the country to economic disaster. Reducing tariffs resulted in a flood of luxury imports and dumping, developments that sparked off a process of deindustrialisation as businesses folded. Manufacturing output declined by more than one-fifth over the first two years of AP government. The trade deficit rose from US\$101 million in 1980, to US\$1,728 million in 1981 and US\$1,609 million in 1982.⁷ Bankruptcies also reduced state revenues at a time when expenditure rose significantly: taxes as a percentage of GDP fell from 20.5 in 1980 to 14.1 in 1983.⁸ One other important effect of government policy was a rapid increase in inflation. Stimulated by the removal of subsidies on basic commodities, particularly foodstuffs and petrol, inflation raced upwards from 60.8 per cent in 1980, to 125.1 per cent in 1983; this is according to official statistics.⁹ This inflationary

⁹ *ibid.*

spiral was boosted by the policy of constant mini-devaluations implemented by the Dynamo as the technocrats strove to maintain the competitiveness of Peruvian exports. In 1980 the *sol* was devalued by 36.6 per cent. By 1982 this figure had risen to 90.7 per cent, reaching 135.5 per cent in 1983.¹⁰

In 1982 the economy stagnated and in 1983 collapsed as GDP fell by 12 per cent. Instead of bringing economic regeneration, the satisfaction of the population's high desire for consumer durables and the million new jobs promised by Belaúnde in his election campaign, the AP government had managed to engineer the worst economic crisis in Peru this century. Using 1973 as a base year, real wages fell from 69 in 1980 to 58 in 1982 and 43 in 1983. Over the same period salaries decreased even further, from 56 to 48 and 36.¹¹ By mid-1984 only 30 per cent of the workforce was in full-time employment, while 62 per cent of the economically active population was underemployed. As a result of the government's economic policies between 1980 and 1984, over 20 per cent of Peru's industrial workers had lost their jobs.¹² The informal sector of the economy increased still further and the already miserable living standards of the majority of Peruvians fell to historically low levels.

As a result of this incompetent management of the economy, by mid-1983 support for the government had slumped to 17 per cent of the electorate, while the popularity rating of President Belaúnde stood at 20.9 per cent.¹³ Popular discontent with AP was heightened by growing corruption within the state bureaucracy, as AP placed its supporters into official positions in a vain attempt to build up a party apparatus. More open police corruption, a breakdown in law and order, food shortages and an inability to tackle the guerrilla problem were other factors contributing to this rise in public hostility towards Acción Popular. Responding to attacks on their living standards, the Peruvian working class staged a series of general strikes that registered varying degrees of success. Stoppages on a plant or sectoral basis also increased markedly. Municipalities organised a succession of regional mobilisations aimed at obtaining higher central government funding. In addition, the incidence of street violence and crime soared as the economic plight of large sectors of the population became more and

more desperate. By January 1984 the culmination of all these developments gave the impression that the government had lost control of the situation, had no direction and that society was falling apart.

Ever since its foundation in 1956, Acción Popular had shown itself to be a party possessing no clear ideological foundation, with a tendency towards fierce internal rivalries, ambitions and splits. Given this history, it was to be expected that widespread popular hostility towards the Acción Popular government would produce severe ructions inside the party. Trends in this direction were also encouraged by the inability of Belaúnde to stand for reelection. A central figure fomenting internal dissension was Javier Alva Orlandini. Beginning in the latter months of 1980, from his position of second Vice-President and leader of the Senate, Alva-Orlandini issued public statements attacking the economic policies pursued by Ulloa and the Dynamo. These criticisms were never fully thought out or developed, and no coherent alternative economic policy was ever advanced by Alva.¹⁴ While openly disagreeing with important aspects of government policy, Alva was sufficiently astute never to make uncomplimentary statements against party *caudillo* Belaúnde. He also ensured that whenever opposition motions of censure were tabled in the Senate he voted with the government majority. By playing on grass-roots disquiet about the economic policies of the government, Alva managed to emerge as the recognised leader of provincial *populista* members of parliament, and from this springboard got himself elected as party general secretary in 1982. An extremely able *apparatchik*, the senator from Cajamarca then began to use his control of the party machine to promote his ambitions of becoming Acción Popular presidential candidate in 1985.

Many influential figures in AP wished to thwart Alva's ambitions. This faction was centred on the Lima branch of the party, those connected with the international business community and certain prominent figures among AP's parliamentary representatives, such as Fernando Calmell del Solar. The group coalesced around Manuel Ulloa, who resigned as Finance Minister in December 1982 amid a financial scandal, and who had made clear his presidential aspirations in late 1983. Over the early months of 1984 a fiercely waged contest developed between these two factions, on occasions degenerating into public insults and fisticuffs between rival parliamentarians. For his part,

¹⁴ Alva once tried to produce an alternative economic strategy in 1982, but it was so vague that it became a topic of public ridicule and was quickly shelved. On this see *Caretas* (789) 5 March 1984.

President Belaúnde attempted to remain above the fray and avoided coming down in favour of either Alva or Ulloa. Well aware of the electoral limitations of both incumbents, Belaúnde felt that the only way the Peruvian right could avoid a crushing defeat in the forthcoming general election was through an alliance with the other major right-wing party, the Partido Popular Cristiano (PPC). Together they might attract sufficient votes to get into the second electoral round, where by playing the anti-*aprista* card, they stood a chance of being re-elected. Accordingly, in January 1984 Belaúnde voiced the possibility of an electoral alliance with the PPC, even going so far as to speculate that PPC leader Luis Bedoya Reyes might be presidential candidate in the event of a joint slate.¹⁵

Alva and Ulloa opposed this threat to their political ambitions, and continued their contest within AP to be nominated as the party's presidential candidate. This was very much a one-sided contest. Despite intense efforts, Ulloa could not break the hold Alva exercised over the party machine. To ensure that this did not happen, the general secretary resorted to all the usual devices. Multiple party cards were issued to many *alvista* supporters. Lists of party membership were drawn up that excluded known sympathisers of the *ulloista* faction. Outsiders with no history of militancy in AP were recruited, issued with backdated party membership cards and paid cash to vote for *alvista* acolytes. Consequently, when internal elections were held on 15 April 1984 to nominate new district committees in Lima, Alva supporting candidates swept home in thirty-eight of the forty-two districts. Malpractice was widespread and brought some unlikely results. For example, in the district of Santa Rosa, the *alvistas* won by a margin of 290 votes, when the register used in the November 1983 municipal elections contained 260 votes, of whom only 168 had marked their cross in favour of Acción Popular. Even more blatant was the fraud perpetrated in the district of La Victoria. Here the *alvistas* won by five thousand votes to nil! On the day these internal elections were held, the *alvistas* hired four buses to ferry their supporters (who had been issued with more than one membership card) from district to district.¹⁶

Alva's control over the party in the provinces was even stronger than that which he enjoyed in Lima. Thus, although attempts were made to clean up the process of candidate selection in subsequent months, Manuel Ulloa was unable to make headway. After a series of party

¹⁵ For further details see *Caretas* (785) 6 February 1984.

¹⁶ *Caretas* (796) 23 April 1984.

assemblies, on Saturday, 13 October 1984 delegates attending the Sixth National Congress of AP overwhelmingly nominated Javier Alva Orlandini as their presidential candidate. In the interests of party unity, Manuel Ulloa and another leading *populista*, Sandro Mariátegui, were selected as Vice-Presidential running-mates. This was against the wishes of President Belaúnde, who had continued with his plan of cementing a right-wing alliance. With Alva, Bedoya, and Ulloa all insisting that they should be presidential candidates and unwilling to accede to a rival, this project foundered on the rocks of personal ambition.¹⁷ In a last attempt to prevent an electoral disaster, the President then tried to unite the right around the candidature of a prominent independent, the novelist Mario Vargas Llosa. Again, this project failed due to opposition from those aspiring for the nomination of presidential candidate. As a result, the Peruvian right committed electoral suicide by entering the 1985 election campaign divided. To make matters worse, the largest political party of the right, Acción Popular, had lumbered itself with a presidential candidate who was an able political manipulator, but totally lacked charisma or popular appeal.

Since July 1980 the PPC had been a minority partner in the Belaúnde government, being allocated two ministerial posts in return for support in parliament. Aware of the administration's great unpopularity, in April 1984 Luis Bedoya forced the PPC ministers to resign. This move was undertaken with one eye on the forthcoming general election. Bedoya and the other party managers hoped, vainly as it turned out, that by distancing themselves from Acción Popular they could escape some of the massive repudiation heaped on the government and so better their electoral position. Meanwhile, the PPC continued to back the ruling party in Congress. Once attempts at forging a joint slate with Acción Popular collapsed, Bedoya made his criticisms more open, on one occasion accusing Alva of being 'mentally immature'. Then an alliance with the dissident *aprista* Andrés Townsend was established to fight the April 1985 election under the title of Convergencia Democrática (CODE).

The recuperation of APRA

While factional and personality disputes rumbled on inside AP, one of

¹⁷ See the interview with Javier Orlandini published in *Caretas* (802) 4 June 1984.

the traditional political opponents of the governing party was attempting to regroup and present itself as a viable alternative administration. The 1980 general election had proved a great disappointment to APRA. Having obtained 35.3 per cent of the vote in the 1978 constituent assembly poll, the party confidently expected to win the 1980 election by a comfortable margin. Flush with money provided by the European Second International and Acción Democrática in oil-rich Venezuela, APRA waged an expensive campaign in 1980 and anticipated victory. This failed to materialise. The central campaign slogan 'APRA has the strength', lost the party thousands of votes as electors remembered unsavoury aspects of party history. To make matters worse, APRA presidential candidate Armando Villanueva not only physically resembled, but had been, a *búfalo*, or a member of the party's squad of thugs organised to maintain party discipline and assault opponents. Political rivals were at pains to highlight this gangster element in APRA history, and achieved considerable success as many independent and left votes went to Belaúnde as 'the lesser evil'. Another factor used to reduce APRA support was the fact that Villanueva was married to a Chilean woman, which led to a dirty campaign in the right-wing press. As a consequence of these developments, in May 1980 APRA only gained 27.4, 27.6 and 27.1 per cent of the poll for President, the Senate and the House of Deputies respectively. Such a heavy defeat worked to exacerbate the divisions that had surfaced in 1978 and after the death of party *caudillo* Victor Raúl Haya de la Torre had removed his unifying influence.

Soon after the May 1980 débâcle, two main tendencies emerged more visibly inside the once near-monolithic party. One revolved around general secretary Armando Villanueva and represented a left current within APRA. The *armandistas* wanted a cautious return to some of the old radicalism that had characterised early party history between 1924 and 1940. During the 1970s APRA's image as an anti-status quo party was successfully challenged by an increasingly vociferous and organised left. In order to meet this competition on its left flank and present itself as an attractive alternative to a politicised younger generation, Villanueva and his supporters argued that APRA had to portray a more radical image. Opposed to this perception of APRA's role in Peruvian politics was the faction headed by Andrés Townsend. Many adherents of this group entered and administered the party during its conservative middle age (1940-68), a period in which APRA supported oligarchic

presidents, opposed agrarian reform and was rabidly anti-communist.¹⁸ Following the May 1980 elections these different interpretations of *aprismo* burst out into the open, coming to a head at the twelfth Party Congress held in Trujillo during the first week of August 1980. At this congress the nominee of Armando Villanueva for general secretary was approved. Opponents were incensed as charges of fraud in the selection of delegates abounded. Eventually two hundred delegates supporting the Townsend faction walked out of the congress, among them Luis Alberto Sánchez and Ramiro Prialé, both important figures in the party's upper echelons. During the walk-out octogenarian Sánchez was roughed up by *armandista* delegates.

Immediately after the conference, attempts were made to bring the dissidents back into the APRA fold, and met with a degree of success when Sánchez and Prialé agreed to reintegrate themselves. To secure this, Sánchez was offered the position of APRA leader in Congress, while Prialé was given the task of organising a special party convention that would deal with the complaints of the rebels and try to reincorporate them into APRA. Townsend was not placated by these conciliatory moves and started to launch attacks against the leadership in the press, calling them 'traitors, usurpers and anti-democratic'.¹⁹ The leadership responded by expelling Townsend on 9 January 1981. Townsend then proceeded to form a political grouping named the Movimiento de Bases Hayistas, and claimed that he was the true heir to the political testament of the party founder Haya de la Torre. Inside APRA, defeat at the polls (the party vote further declined to 22.7 per cent at the municipal elections of November 1980), and what was perceived as poor handling of the dissident question, seriously weakened the position of Villanueva. This created the political space for the emergence of a third tendency within APRA's National Executive Committee. Its leading figure was Alan García Pérez.

¹⁸ Founded in Mexico in 1924 and seriously organised inside Peru from the late 1920s, the first phase of APRA's existence was characterised by the adoption of a populist and nationalistic programme. Anti-imperialism and hostility towards the Peruvian 'oligarchy' formed an essential part of Haya de la Torre's strategy for building a multi-class radical organisation based on medium- and small-scale entrepreneurs, the professional middle class, workers, artisans and peasants. In 1932 APRA launched a number of unsuccessful 'revolutions' in northern Peru, and following their defeat, suffered a period of repression. During the 1940s the party started to move to the right, a process that culminated in 1956 when it entered into a pact with representatives of the Peruvian elite and backed the conservative government of Manuel Prado. See M Valderrama, J Chullén, N Lynch and C Malpica, *El APRA: un camino de esperanzas y frustraciones*, Lima 1980. On the growing split within APRA see R González, '1978-1981: cronología de un conflicto', *Debate* (7) March 1981.

¹⁹ R González, 'La división del APRA', *Que Hacer* (11) July 1981, p 43.

Villanueva had placed García in charge of party organisation. From this position of control over the party machine, García and his staff organised the nomination of Villanueva as presidential candidate and hounded sympathisers of the rival Townsend faction. García was also campaign manager for Villanueva in 1980 and declared himself 'an *armandista* one hundred per cent'. Soon after the electoral débâcles of 1980, however, the young lawyer began to distance himself from his *patrón*. Surprisingly given that he had been orchestrating the anti-Townsend campaign inside the party, García started to argue for a more conciliatory posture towards the dissidents. He made overtures to those expelled or separated from the party and called for an amnesty. Dismissing the left as an electoral force, and claiming that Villanueva had failed as a leader, García maintained that the 1985 election would be fought against an AP-PPC alliance, or the two right-wing parties fighting separately. In this contest, García argued, Andrés Townsend was the only APRA candidate who could successfully confront Bedoya, Ulloa, Alva or Orrego, the AP mayor of Lima who was rumoured to be a nominee of Belaúnde because he was favoured by the President's wife. Naturally, when mooting this scenario, García made no reference to his own presidential aspirations. When calling for an amnesty, García also presented a number of other proposals to the NEC. He advocated a complete revamping of APRA's political style and image. The party should distance itself from certain members of the cocaine mafia who had reputedly helped finance the 1980 election campaign. The long-established sectarianism of the party should be dropped, and the activities of the *búfalos* restrained. APRA needed to democratise its structures, make the party more open to independents and try to attract a far wider level of support than the 25 per cent of the population who were traditionally *aprista*.²⁰ According to García, APRA needed to convert itself into a moderate social democratic party along the lines of the PSOE in Spain. These proposals earned García the criticism of being disloyal from Villanueva, his former colleagues in the control commission and older generation party stalwarts. On the other hand, the appeals for unity made by the young deputy proved very popular among rank-and-file party members, who above all else desired an end to the leadership squabble and the *caudillismo* of Villanueva and Townsend. Calls for a change in APRA political style enhanced García's claims to be a party leader of national stature. He also received

²⁰ See the interview with Alan García in *Caretas* (653) 22 June 1981.

backing from important party veterans Sánchez and Priolé, who sheltered him from attack and encouraged his initiatives.

These pressing internal problems prevented APRA from making a coherent and effective opposition to the AP government in 1981 and 1982. Nevertheless, by early 1983 signs began to emerge that this crisis was slowly being overcome. Employing his new-found stature inside APRA to good advantage, and benefiting from the inability of more established leaders to reach agreement on a mutually acceptable candidate, García was elected general secretary in a turbulent party congress held in October 1982. The new party boss then proceeded to implement the changes he deemed necessary if APRA was to reverse its political decline and win the 1985 presidential election. Moves were made to attract independents and adopt non-sectarian postures. García also strove to clean up the party image by breaking links with the cocaine mafia. Stress was laid, through a well-orchestrated public relations campaign, on party unity. The positive impact of these manoeuvres was illustrated in the municipal elections held in November 1983, when APRA, aided by widespread discontent with the government, raised its total number of votes by 46 per cent compared to November 1980. With 33.2 per cent of the national vote, the party stood four points ahead of its nearest rival. Such a positive result in November 1983 could only strengthen the position of the young general secretary and endorse the changes he was attempting to bring about. Thus, when elections were held in February 1984 to select the APRA presidential candidate, García won comfortably. His candidature was announced on 24 February 1984, APRA's 'day of fraternity' that the party faithful celebrate each year to commemorate the birthday of party guru Haya de la Torre. APRA was the first major political grouping to select its presidential candidate. In fact, Alan García had been so confident that his nomination would be successful, that he had in effect initiated his election campaign in January 1984. Such an early start was to be of immense advantage and make a valuable contribution to APRA's eventual victory in April 1985.

Left regroupment followed by stagnation

As with APRA, the general election of 1980 proved an abysmal failure as far as the left were concerned. In the 1978 Constituent Assembly elections left-wing candidates obtained 30 per cent of the poll and hopes were high that this level of support could be repeated or even surpassed in 1980. To attain this, it was necessary to present a unified electora

front. Despite rank-and-file pressure in favour of this, the sectarianism and *caudillismo* that has characterised left-wing politics in Peru could not be overcome. On the eve of the deadline set for registering a list of candidates representing all the important tendencies, the left alliance fragmented.²¹ Five separate candidates of the left contested the presidency with their respective lists of candidates for parliament, a situation that created widespread dissatisfaction among left sympathisers. In the ensuing electoral disaster, many on the left voted for Belaúnde as the best way of preventing an APRA victory. With its forces dispersed, each left slate received a derisory share of the poll, and overall they obtained less than 18 per cent of valid votes cast.

Such a bitter experience brought renewed efforts in the immediate post-election months to construct left unity around a minimum programme acceptable to the various organisations. Out of this process emerged Izquierda Unida, a coalition of *velasquistas*, the pro-Moscow CP, several Maoist parties and groups with a Guevarist tradition. The first real test of this new electoral alliance occurred in November 1980, when municipal elections took place. The left vote was raised by 60 per cent in Lima and the nascent political bloc beat APRA to take second place behind AP. Victory was obtained in Peru's second city, Arequipa, as well as five other departmental capitals. Nationally, the left alliance garnered 24 per cent of the vote, slightly more than APRA.²² Although IU failed to centralise itself administratively and act as a cohesive political unit, during 1981 and 1982 the alliance was able to benefit from APRA's preoccupation with internal disputes, to emerge as the major opposition bloc to the AP government, both in parliament and on the streets. This laid the basis for a creditable performance in the municipal hustings culminating in the elections of 13 November 1983. Dapper *serrano* lawyer Alfonso Barrantes, with his down-to-earth manner and provincial wit, out-debated his main rival for the mayorship of Lima, the young and inexperienced APRA candidate Alfredo Barnechea. An intelligently conducted campaign brought IU 36.5 per cent of the poll, and victory in Lima. Nationally, the left received 28.9 per cent of the vote, a level of support within sight of the 33.2 per cent obtained by APRA. Splits within the left alliance lost IU two important

²¹ For background information see, *ARI: por qué y como se desintegró?*, Ediciones Sociedad y Política, Lima 1980.

municipalities, those of Arequipa and Tacna, but this was partly compensated for by victory in Cusco and Huancayo.²³

The outcome of the November 1983 poll indicated that the main threat to APRA's hopes of victory in April 1985 would come from the left. Militants in both political camps realised that the degree of success registered in the forthcoming general election depended on which force could place itself at the head of the opposition, tap popular discontent and project itself as a viable alternative government. By its very nature IU was distracted from this task. Whereas APRA was a single political party with a long tradition of internal discipline, and by early 1984 was united behind the candidacy of Alan García, the situation in IU was not so clear cut. IU was a newly established electoral alliance containing a wide range of left groups with very different political traditions and a history of sectarian rivalry. From mid-1984, jockeying for position both *vis-à-vis* the composition of the presidential ticket, and to gain a favourable ranking in the list of parliamentary candidates, became intense. The left started to devote a lot of energy to these internal matters at the expense of leading the struggle against AP and its unpopular economic policies. Not until October 1984, when the deadline for registering candidates approached, did IU manage to agree on its presidential ticket. With Barrantes standing for President, Enrique Bernales of the Partido Socialista Revolucionario as first Vice-President, and Agustín Haya de la Torre of the Partido Unificado Mariateguista as the second Vice-President, the left had managed to concoct a well-balanced team quite capable of holding its own in debate with any of its rivals. However, the ponderous and acrimonious selection process had lost IU vital months of electioneering and placed its position as leader of the opposition to the AP government in jeopardy.

APRA lays the foundation for victory in 1984

Meanwhile, APRA had been building up its campaign since the beginning of the year. Discussions at various meetings of APRA's National Executive Committee in November and December 1983 analysed why Alfredo Barnechea and the party lost the Lima municipal election. One important conclusion drawn was that defeat was partly due to the fact that in 1982 and 1983 IU had put itself at the head of the opposition to Belaúnde. It was deemed crucial, therefore, that APRA

²³ F Tuesta, *El nuevo rostro electoral: las municipales del 83*, Lima 1985.

challenge the left on this terrain and try to win the initiative. One measure García adopted to attain this end was to seek greater coherence in APRA's hitherto patchy parliamentary performance. Efforts were made to make the party's attacks on the government in parliament harder hitting and give them a higher profile. With this end in mind, APRA's general secretary addressed an open letter to the President during the first week of January 1984. This called for the resignation of the Finance Minister Carlos Rodríguez Pastor and a reversal in government economic policies. Even though the document was extremely vague and contained no concrete proposals, it did become the subject of wide discussion and took the limelight away from the left leader, Barrantes, who was currently engaged in discussions with President Belaúnde on the question of municipal funding.²⁴ Employing similar tactics, over the ensuing months APRA parliamentarians registered success in projecting the image of a coherent and vociferous opposition, although no well thought-out alternatives to existing government policies were ever forthcoming. Hand in hand with this attempt to increase its stature on the parliamentary terrain, García eschewed his former reticence on the question of labour unrest and started to make public pronouncements in support of workers engaging in strike action. This return to the old APRA populism was a tactic aimed at winning over working- and middle-class sectors of the population, especially in the electorally crucial Lima conurbation, that had given their support to IU in 1983.

Apart from these developments, a campaign was launched through the media to project García as a young dynamic leader who possessed the energy to tackle the nation's pressing problems. With respect to this, APRA tacticians were acutely aware that García's age—he was thirty-five in 1984—was a vulnerable point that his opponents would seek to exploit. In an attempt to shield their candidate from the charge of inexperience, a series of foreign tours was planned. On a trip to Venezuela in February 1984, the youthful general secretary made sure that he was photographed alongside Carlos Andrés Pérez, the ex-President of Venezuela and Felipe González, the Spanish Prime Minister. Other visits to Europe, North Korea and Cuba followed and meetings with heads of states arranged.

APRA's goal of replacing the left and substituting itself at the head of the opposition in 1984 was greatly facilitated by problems besetting IU.

²⁴ *Caretas* (781) 9 January 1984.

In addition to the difficulties created by candidate selection, success in the November 1983 election for control of Lima council proved to be a handicap rather than the expected stepping-stone to the presidential palace. The rightist central government obviously had no wish to see the Marxist mayor succeed during his tenureship in the municipality, and so blocked funds. Million dollar loans contracted with the World Bank to finance a series of municipal projects were held up by the Finance Ministry in Lima. Credits from the central government were also mysteriously delayed. A similar fate overtook a US\$30 million project to update the obsolete property register, a scheme that would augment municipal finances by a factor of three. As a consequence of these manoeuvres, the Lima council found that it only had sufficient funds to meet a third of its most essential expenditures. No improvement in the cleanliness of the city occurred—most of the rubbish disposal vehicles were immobile and no cash was available to purchase spare parts—with the result that Barrantes' popularity decreased. Other factors heightening discontent with the performance of the IU council were an inability to prevent the *ambulantes*, or street sellers, reinvading the town centre, as well as problems that arose with municipal employees demanding higher wages. A series of strikes developed, adding to the accumulation of rubbish on the streets and tainting the image of the mayor. The success of the IU campaign to provide one million glasses of milk each day to young children settled in Lima's shanty towns was not sufficient to offset the strident attacks against Barrantes and the IU made in right-wing publications such as *La Prensa*, *24 Horas* and *Oiga*. As a result of this press campaign and its own inadequacies, the standing of the IU council in Lima had already fallen sharply by June 1984, a development that was to have important electoral repercussions ten months later.

The election campaign

The first round of serious electioneering took place in November 1984. Opinion polls conducted in late November 1984. Opinion polls conducted in late November confirmed expectations that APRA would be the front runner. Over half (51.8 per cent) of electors canvassed declared that they would vote for Alan García. Only 15.1 per cent and 13.9 per cent expressed support for Luis Bedoya of the PPC and Alfonso Barrantes of IU respectively. AP candidate Alva Orlandini was

placed a poor fourth, with only 4.6 per cent.²⁵ Although far from infallible, such polls provided a good indication of how effective APRA strategy had been in 1984. The party symbol had been changed from the traditional star to a dove, denoting peace and social reconciliation. Villanueva's 1980 slogan 'APRA has the strength', had been dropped to be substituted by García's 'My commitment is to all Peruvians' and 'Democracy begins with the poorest'. The latter phrase formed part of APRA's populist appeal aimed at wooing the most deprived sectors of the electorate away from IU, while the former was devised to highlight APRA's new anti-sectarian image and project the party as a more open democratic body willing to cooperate with other political forces. True or not, this message proved extremely attractive to many electors and was seen to produce results when the miniscule Christian Democrat party announced that it would back APRA. In January 1985 García's policy of winning as many allies as possible registered another minor success when Solidaridad y Democracia, an institution headed by two economists (Javier Silva Rute and Manuel Moreyra) who had held top positions during the Morales Bermúdez military dictatorship, also declared its support for Alan García. These, as well as the other tactical changes already mentioned, had helped APRA increase its popularity by 20 per cent in the twelve months after November 1983.²⁶

Being so far ahead of their nearest rivals had an important impact on APRA campaign strategy. On numerous past occasions the party had appeared set to win an election, but with victory in sight had eventually lost after a series of last-minute blunders. This had happened in 1963 and again in 1980. More recently, a similar fate had befallen APRA's candidate in the Lima municipal elections of November 1983. A crucial turning point in the latter campaign was a series of televised debates in which Barrantes of IU had outshone APRA's nominee. García's campaign managers were well aware of this APRA tradition and feared that a repetition of these events would seriously harm their candidate. Consequently, on only two occasions was García allowed to sit on the same platform as his presidential rivals. One was before an audience of Peruvian businessmen in November 1984, and the other at a meeting of

²⁵ *Casetas* (828) 3 December 1984. The techniques of conducting opinion polls are as yet underdeveloped in Peru. Samples tend to be small and Lima biased. Since the municipal elections of November 1983 attempts have been made to predict voting trends in the most important provincial towns, but overall Peruvian opinion polls remain unsophisticated.

²⁶ *Casetas* (778) 12 December 1983.

the National Agricultural Council (CUNA) in January 1985. At these events the candidates outlined their policies for the industrial and agricultural sectors, with no televised debate taking place. Several face-to-face confrontations between the four major contenders for the presidency had been programmed, but García refused to attend any of them, claiming that he was too busy on the hustings around the country. APRA campaign managers were aware of García's nervousness in debate and feared that he would receive a mauling at the hands of experienced polemicists like Barrantes and Bedoya. As the front runner, the other three candidates would be primarily intent on attacking García. In such a situation the APRA candidates' inexperience and the party's lack of detailed policies ran the risk of being exposed. After conducting their own opinion poll on the issue, APRA's campaign strategists correctly assessed that the loss of support caused by their candidates' refusal to debate would be small compared to the potential damage resulting from a poor performance before the television cameras. Notwithstanding their massive lead in the opinion polls, APRA's election strategy consequently had an important defensive aspect.

Instead of attempting to win support on the basis of political debate, APRA mainly relied on a small number of well-packaged advertisements. These concentrated on projecting the image of Alan García as a Peruvian equivalent of the Spanish Prime Minister Felipe González. Dubbed over footage of García on the beach talking to fishermen, in the *sierra* with Andean peasants or speaking to a packed *plaza*, was a jingle, to the music of the popular waltz '*Mi Perú*' stating what a beautiful country Peru is and how proud García is to be a Peruvian. Rounding off the nationalist message came the slogan 'My commitment is to all Peruvians'. No policy statements, but effective propaganda. Thus at a national level, APRA's campaign helped to distract attention from its lack of anything approaching a detailed political programme that addressed the nation's pressing problems. Indeed, not until after the April election did APRA publish its *Plan de Gobierno*. Even in his end-of-campaign election address on national television, Alan García never got beyond talking at the level of generalities. However, at the local level APRA parliamentary candidates did engage in debates with their rivals and produce detailed policies aimed at solving departmental or provincial problems. These were mostly revamped proposals that had been drawn up for the November 1983 municipal elections.

García's refusal to debate with the other presidential candidates made it far more difficult for his rivals to whittle away APRA's commanding advantage in the opinion polls. As the only serious competitor to APRA, IU found this especially frustrating. Part of IU strategy for narrowing the wide gap between the two front-runners was to engage the APRA presidential slate in televised debates, in the hope of deflating the image of Alan García while simultaneously raising that of Alfonso Barrantes. Moreover, the left was confident that any discussion on the respective party programmes would enable it to wrest some of the initiative away from APRA. Whereas APRA failed to produce a programme prior to election day, the IU *Plan de Gobierno* was published in March. Synthesising the work of eighty-three teams involving 520 individuals, this document stated IU policies on the debt problem, industrial and agricultural strategy, foreign policy, culture, decentralisation, political objectives and other major issues.²⁷ The production of this programme was facilitated by the left's dominance of intellectual life in Peru and IU's ability to employ the services of researchers who had been studying the country's economic and social problems for many years. Although the left held an advantage insofar as it had elaborated a more comprehensive political programme compared to competing forces, the absence of serious debates between the candidates prevented IU from utilising it to effect.

This problem was exacerbated by the disadvantageous position of IU in terms of media access. In 1980 the left could disseminate its message through the newspaper *El Diario*, which possessed a higher quality and a relatively larger circulation than the rest of the Peruvian press at that time due to the deadening impact of military censorship. By 1984 the usefulness of this avenue of communication was much reduced due to mismanagement and internal struggles to control the paper. Standards fell and so did circulation. Although the daily *La República* supported the left for much of 1984, during the election campaign a series of changes in its internal power structure led this newspaper to adopt a pro-APRA stance. The rest of the popular press were hostile to IU, with the result that the left found itself at a serious disadvantage when trying to get its message across to the electorate. Likewise, IU did not have access to the same amount of paid television time as the other major contenders for office. APRA received large sums from the Second International and Venezuela and could buy many slots. On the other

²⁷ *Plan de Gobierno de Izquierda Unida*, Lima, March 1985.

hand, IU had to rely far more on internal sources for funding, which did not produce gargantuan quantities of cash in a country suffering deep economic crisis.²⁸ Thus IU could not match APRA or the right in terms of the advertising time it could buy on television. For the same reasons, the left was unable to equal the slickness of APRA's propaganda effort, which was produced under the supervision of European political image-makers. Apart from financial problems, the efficacy of IU's campaign in the media was reduced by a lack of inventiveness, even though great improvements had been made when compared to the 1980 election.

Overall, the left could not complain of censorship. IU received its quota of free advertising time on radio and television. This is not to say that no discrimination took place. Most of the media completely ignored the impressive rally held in March 1985 to celebrate the Lima council's achievement of distributing one million glasses of milk a day to children in the shanty towns. On the current affairs programme *Conecciones*, which was broadcast every night, IU candidates were hardly ever invited, while APRA, PPC and AP politicians constantly appeared. Similar tactics were employed by every television channel. All presidential candidates were given a thirty-minute slot to address the electorate on the evening of the last day of hustings. The time allocated to Alfonso Barrantes was mysteriously changed without notice at the last moment and the IU leader arrived too late to appear.

Convergencia Democrática, the third major contender for power, continued to offer the electorate standard monetarist fare during its election campaign and severely criticised AP for fudging on this question. At meeting after meeting Bedoya was at pains to spell out that the only way Peru could overcome the crisis was to reduce state expenditure, denationalise and exercise a strict control over the money supply. To assist recovery, he argued, more aid should be given to those with capital, for this was the only way to increase employment and the wealth of the nation. This message did not prove very popular—in effect he was offering the electorate more of the same medicine—but it did present voters with a coherent right-wing strategy. An element of populism did nevertheless enter into Convergencia Democrática policy when they addressed the all-important issue of the foreign debt. Bedoya

²⁸ To help finance its campaign IU sought assistance from Gustavo Mohme, the head of an important construction company, and Miguel Mufarech, a textile manufacturer. In return these two entrepreneurs were given favourable slots in the IU list of candidates for the Senate. Both were elected

charged the international banks with usury and criticised 'American imperialism' for keeping interest rates high. The PPC leader argued that a drastic cut in interest rates allied to generous rescheduling was necessary, otherwise Peru would not be able to pay off its debt. Such attacks against this aspect of the world banking system by the leader of the Peruvian right failed to impress most electors.

Strategically, Convergencia Democrática rested its hopes on attaining a respectable second place in the 14 April poll. This, they anticipated, would result in a run-off election between APRA and themselves. When forced to choose between these alternatives, Convergencia Democrática could play the *antiaprista* card, so attracting votes from both left and right. According to this scenario, the Convergencia Democrática could overcome a relatively poor showing in the first poll eventually to win the presidential election. Encapsulating these expectations were two of the right's key slogans during the campaign: 'There's no first without a second', and 'Second in the first, first in the second'. These were the messages most frequently relayed to voters in Convergencia Democrática advertisements. In order to accomplish this strategy, CODE needed to reduce support for APRA and IU, first to ensure that APRA did not attain 50 per cent of the vote and outright victory in the first round, and second, to leapfrog over IU into second place. To achieve this, Convergencia Democrática propaganda stressed the 'totalitarian' nature of APRA and IU. The communist threat to Western civilisation was also publicised, as well as the reputed incompetence and inexperience of the two front-runners. By contrast, attempts were made to project the image of Luis Bedoya, laying emphasis on the fact that he had been an extremely successful mayor of Lima in the 1960s. Bedoya was thus a competent administrator, in contrast to García or Barrantes, who possessed the political determination and vision to pull Peru out of its current crisis. One other aspect of the Convergencia Democrática's efforts to improve the image of Luis Bedoya—in the past he had expressed admiration for Pinochet—was to point out repeatedly that the PPC leader came from humble lower middle-class origins. Campaign tacticians hoped that by emphasising this they could deflect attacks on the PPC as being a party of *pitucos*, or the rich. In addition to criticising APRA and IU, the Convergencia Democrática also tried to win votes from disillusioned AP supporters by claiming that a vote for the government party would be wasted, and it represented the only serious bulwark against the 'red peril.'

Given that the PPC was the main political backer of *Convergencia Democrática*, in electoral terms the rightist alliance had most of its support concentrated among middle-class voters in the Lima conurbation. The PPC's organisation in the provinces was, moreover, very weak. In an attempt to increase its vote more evenly over the country, at first most *Convergencia Democrática* meetings were held in the provinces, with Lima being reserved for the latter stages of the campaign. Naturally, as the alliance backed by the Lima elite, *Convergencia Democrática* experienced no problems in financing its campaign and attaining a large amount of media coverage. Its political propaganda was in part cleverly devised and well presented. The problem was that the message behind the jingles and nice-sounding slogans proved unpopular with an overwhelming majority of the electorate.

No noticeable economic improvement took place in 1984. Inflation rose to 150 per cent, unemployment increased, the currency devalued almost daily and living standards continued to fall. Misgovernment was evident in all walks of life. Against this backdrop AP started its election campaign. The ruling party appeared to have no chance of success and rumours circulated that it would withdraw in order to avoid a humiliating defeat at the polls. These rumours proved unfounded and Alva Orlandini made every effort to fight an aggressive campaign. Although AP was only registering 4.6 per cent support in opinion polls conducted in December 1984, these results were Lima-based. The party hoped that traditional AP strength in the provinces and its predominance in the departments of Amazonia would enable it to increase its share of the vote to a respectable level.

During its campaign, AP laid emphasis on the experience and technical ability of the party, an ineffective propaganda line given that most voters blamed AP incompetence for creating social and economic mayhem. Undeterred, AP politicians argued that the crisis was due to a variety of factors outside their control, such as the world recession, problems inherited from the military dictatorship, Sendero Luminoso subversion and left-wing agitation. Rather than being responsible for the present chaos, AP propaganda stressed that between 1980 and 1984 the government had completed more development projects than any other regime in Peruvian history. Faced with the current difficult situation, the task of government could be safely entrusted to just one political party. Both APRA and IU were totalitarian, undemocratic political forces. If either were elected, there was a real danger of

military coup. Alternatively, they would violate the constitution, undermine the country's nascent democratic institutions and try to establish one-party rule. On the other hand, Convergencia Democrática represented the rabid right. Its politicians were out of touch with Peruvian reality, and the election of Bedoya would provoke a left-wing backlash that would bring the country to the verge of civil war. AP thus represented the sole centrist political party in Peru and provided the only real option before the electorate.

So went the propaganda, and the AP enjoyed unlimited media access for disseminating its message. On the state-controlled Channel 7, propaganda in favour of AP was transmitted all day long. Every day, programmes showing President Belaúnde initiating public works projects or attending ceremonies to celebrate their completion, took up over three hours of viewing time. AP propaganda was broadcast *ad nauseam*, with intermittent showings of the Pope's visit to Peru in late January 1985. In these prominent Acción Popular politicians were seen in the presence of the Pope, with the implication being that the government party had papal backing. A similar barrage of AP propaganda was served up by Channel 4. Mauricio Arbulú, second-in-command of the party's election campaign holds a high position in that network. Despite the clear advantage enjoyed by AP with respect to the media, blatant official favouritism did not guarantee that their propaganda would be inventive or effective. Overall, this aspect of AP's election campaign was inferior to that devised by APRA. Nor did AP eschew the use of underhand tactics in order to get itself out of fourth place in terms of electorate preference. The state-controlled Channel 7 contracted an AP-supporting journalist employed on the conservative daily *El Comercio*, Alfonso Baella Tuesta, to produce an eight-part television series on the history of elections in Peru since 1930. This programme was broadcast in the weeks immediately preceding the April poll and its general editorial line was hostile to APRA. Alan García unsuccessfully tried to get its showing suspended until after the election. Events were soon to indicate that this crude attempt at stirring up traditional hostility to APRA, especially in Lima, proved a failure.

The election results

After a campaign characterised by banal sloganeering, a reluctance to present the electorate with detailed policy proposals and an absence of serious debate between the presidential candidates, voting finally took place on 14 April. Despite Sendero Luminoso's declared intention to

Table 1: Votes cast for presidential candidates (April 1985)

disrupt the poll, the ballot proceeded relatively trouble-free. With a few exceptions, the elections were clean. Four hours after the polling booths closed early results confirmed the predicted APRA landslide, but due to bureaucratic inefficiency the Jurado Nacional de Elecciones (JNE), or National Election Office, did not announce official results for the presidential component of the election until 1 June. These gave Alan García 45.74 per cent of the vote, more than double that obtained by IU (see Table 1). Although APRA fell short of the 50 per cent plus one vote necessary to register outright victory, IU president Alfonso Barrantes realised that the gap between the two front-runners was such that the left would have no chance in the second round. Barrantes made public his opinion and on 25 April a meeting of the general secretaries representing all the parties inside IU ratified the decision not to contest a run-off election.²⁹ Consequently, Alan García was declared the next President of Peru by the JNE on 1 June 1985.

APRA also garnered sufficient votes to command clear majorities in both chambers of Congress (Table 2). Such a majority was vital given the role played by a hung parliament in fomenting the Velasco coup against the first Belaúnde administration in October 1968. Support for the victorious party was naturally strong in its traditional stronghold of Northern Peru, the so-called *sólido norte*. In the birthplace of *aprisme*

²⁹ *El Comercio*, 26 April 1985. Discounting blank or invalid ballots, APRA obtained 53.1 per cent of the vote. Acción Popular had passed an amendment to the constitution making invalid any blank votes count in the computation of votes for the presidency. This change was motivated by desire to stop APRA winning on the first round. The right anticipated that it could come second in the first round and then beat APRA in the run-off.

Table 2: The distribution of parliamentary seats: 1985–90
(1980–85 figures in brackets)

	<i>Senate</i>	<i>House of Deputies</i>
APRA	32 (18)	107 (58)

AP	5 (26)	10 (98)
Others	1 (3)	3 (7)

Source: Jurado Nacional de Elecciones

the department of La Libertad, the transferable vote mechanism for allocating parliamentary seats for the House of Deputies, gave APRA ten representatives out of eleven. IU managed to win the remaining slot. In the neighbouring department of Cajamarca, the electors voted in seven APRA deputies. Here IU obtained two seats, compared to none in 1980, while AP was reduced to a solitary deputy. Lambayeque department returned six *apristas* and two representatives of IU. So, although IU entered the political map for the first time in electoral terms, this was largely at the expense of Acción Popular, who saw its number of deputies slashed. APRA hegemony in its home territory remained as strong as ever (Table 3).

One region where APRA has traditionally been weak compared to Acción Popular and the left is Southern Peru. In this area APRA's share of the vote increased noticeably. Puno, something of a left stronghold, gave Alan García 107,191 votes compared to 80,159 cast in favour of Alfonso Barrantes. Similarly, in 'red' Cusco APRA's leader won 103,302 votes to IU's 85,685. Arequipa garnered the *apristas* 101,780 votes and IU 117,912 to IU.³⁰ With respect to the number of deputies elected in these departments, in Puno APRA attained three seats, the same as IU. *Indigenista* candidate Pedro Cáceres got himself elected, as did one member of Acción Popular. APRA and IU shared the eight deputies allocated to Cusco, while in Arequipa the two major political forces obtained three representatives each. Here Acción Popular and Convergencia Democrática shared the remaining three seats with an independent candidate.³¹ Thus APRA's vote in Southern Peru reached a historically high level. It appears that many people who voted for Acción Popular in 1980 switched their allegiance to APRA. On the

other hand, IU did not consolidate its position as the region's major political force after the November 1983 municipal elections. With respect to the Central Sierra, the two front-runners were approximately equal in strength. The important department of Junín gave 137,678 votes to García and 126,405 to Barrantes.³² Four APRA deputies were elected, along with four leftists. Convergencia Democrática and AP both succeeded in getting one representative into the House of Deputies. Ayacucho, the home of Sendero Luminoso, returned two *aprista* deputies and two for IU (Table 3). East of the Andes, the departments of Amazonia had for two decades been a bastion of Acción Popular. In April 1985 this traditional loyalty was swept away on the APRA tide.

Where APRA gained decisive advantage and turned the election wholly in its favour was in the Lima conurbation, which comprises nearly 40 per cent of the total electorate. The capital has a long anti-APRA tradition. Only once since 1931 has APRA won an election in Lima. Taking into account the strong showing of IU in the municipal hustings of November 1983, when the left won in twenty-one districts compared to APRA's five, and considering the strength of the PPC in the capital, it was speculated that APRA support would be lower than in the provinces. A poorer than average turn-out for APRA in Lima was potentially important, as it could have deprived García of a majority in parliament. This APRA fear did not materialise. The party registered a higher number of votes than IU in nineteen districts that had given majority support for Barrantes in 1983. Only in Ate and Independencia did the left vote increase. Its share of the poll slumped significantly in Comas and San Martín de Porres, two districts with a high proportion of shanty town dwellers. Overall, votes cast for Alan García in Lima totalled 1,265,327, compared to the 488,734 obtained by Barnechea in the municipal poll. On the other hand, the left vote fell from 622,899 in 1983 to 583,233 in 1985. APRA thus claimed twenty-one deputies and IU only ten, instead of the fifteen anticipated by the left. Convergencia Democrática obtained seven seats and Acción Popular just two (Table 3).

Nationally, 107 APRA candidates were returned to the House of Deputies, giving the party a clear majority in the lower chamber (Table 2). This was determined at a departmental level. On the other hand, the composition of the Senate was calculated on a national basis. For

³² *La República*, 1 June 1985.

example, APRA attained 53 per cent of valid votes cast for the Senate, which entitled the party to thirty-two seats in the sixty-seat chamber. As with the election of deputies, a preferential vote was also included in the complex electoral system, so the thirty-two *apristas* with the highest personal poll were elected. Heading the APRA list was party veteran Luis Alberto Sánchez, who garnered a personal vote of 463,314. He was followed by the 1980 presidential candidate Armando Villanueva with 191,866 votes. For IU Javier Díez Canseco of the PUM obtained 191,950 votes, while the Communist Party leader Jorge del Prado, gained 183,022 preferences.³³

One of the main features of the April election was the collapse of Acción Popular, who received over 1.4 million votes less than in May 1980. The governing party's share of the poll for President declined from 45.5 per cent in 1980 to 6.25 per cent in 1985. This precipitous fall provided adequate testimony to popular opinion about Acción Popular's performance in office. The PPC, through its alliance *Convergencia Democrática*, proved unable to take advantage of the demise of Acción Popular and constitute itself as a viable alternative right-wing government. Its share of the poll rose only marginally, from 9.6 per cent in May 1980 to 10.24 per cent, less than half the votes cast for IU. At first glance then, the April 1985 election was a disaster for the Peruvian right.

Why was the gap between APRA and IU so large? In February and March 1985 sectors of the left felt that APRA would win by approximately 10 per cent in the first round enabling IU to put up a respectable fight in the run-off election and provide an opportunity to attack APRA for its lack of programme. Equally important, with this narrower margin between the two major political blocs, APRA would not acquire a majority in parliament, so giving the left extra political leverage. This projection did not materialise, as APRA beat the left by 1.8 million votes. Some of the reasons explaining this difference have already been mentioned and need not be repeated. One additional factor of prime importance was widespread unease among all sectors of the electorate that the election of Barrantes could bring about an Allende syndrome, e.g. a right-wing coup would ensue which might lead to civil war, or at least result in a significant upsurge in support for the guerrillas. Few people wanted a return to military government. Also, the right-wing media lost no opportunity in claiming that victory

³³ *El Comercio*, 3 July 1985.

for IU would bring even greater chaos, ushering in a situation similar to that found in neighboring Bolivia. Thus large sectors of the uncommitted electorate not surprisingly voted for a more moderate alternative that at the same time appeared to offer new hope and a solution to the crisis. Anti-communist propaganda emanating from the media helped to reinforce these sentiments.³⁴ Consequently, it was APRA rather than IU who succeeded during 1984 in presenting itself as the safest alternative government, and so managed to attract the 20 per cent of floating voters who had helped to put Belaúnde into the presidential palace in 1980. Although a large proportion of the Peruvian population are willing to elect left-wing trade union leaders and town councils, as yet they do not have an equal degree of confidence in IU when national elections occur. This has been one of the left's major problems since 1978.

Another factor that helped to widen the gap between IU and APRA was that the left's campaign was not unified because of the divisive impact of the preferential vote. Many IU candidates fought for their own election or for representatives of their own particular organisation. As a single party, APRA was able to conduct a much more centralised campaign. Whereas Alan García commenced his cycle of public meetings in May 1984, touring the country twice and speaking on 350 occasions, the left began its campaign very late and found it difficult to narrow the margin separating IU from APRA. Although it organised the largest public meetings, IU held fewer of them compared to its three rivals. Moreover, of the ninety-seven major rallies organised by IU, presidential candidate Alfonso Barrantes spoke at only forty-seven. With hindsight it can be said that the left did not campaign hard enough, especially in the Lima shanty towns. A further important error in IU strategy was a failure to make the attack against corruption a major element in its campaign. APRA gave this popular issue a high priority, and as a result gained further electoral support. One other weakness of the IU campaign was a failure clearly to distinguish its policies from those of APRA. Barrantes also fudged on the question of supporting public sector workers on strike, out of fear of being labelled extremist, and this may have lost IU votes.

³⁴ This kind of propaganda was not confined to the press, radio and television. *Campesinos* in Cajamarca told me that APRA supporters were going around the countryside stating that if IU won the election all land and women would be collectivised.

Some of APRA's key policy proposals

Having failed to produce detailed policies prior to the April election, in the weeks following the poll APRA's Comisión Nacional de Plan de Gobierno (CONAPLAN), or National Planning Commission for Government, intensified its activities. Under the directorship of second Vice-President Luis Alva, CONAPLAN has over the past three months been trying to complete its economic programme entitled *Plan Perú*. At the time of writing (August 1985), large sections of the APRA programme still await formulation, although statements on broad policy objectives have been published. In many respects the most important issue facing the new government concerns the foreign debt, which currently stands at around US\$14 billion. How this problem is tackled will determine the level of resources devoted to the administration's other policy initiatives. Shortly after his election victory, Alan García started to launch renewed attacks against the IMF, branding it as 'Washington's policeman' and 'technically incompetent'. The new government intends to have no dealings with the Fund. Instead, it will try to negotiate directly with Peru's creditors.³⁵ At these discussions, the APRA administration will endeavour to obtain concessions, and has voiced a desire for a three-year moratorium. In addition to long-term restructuring, García in his inaugural speech on 28 July 1985, stated that yearly interest payments will initially be fixed at a maximum of 10 per cent of export earnings.³⁶ There has been no talk of default. On the other hand, attempts will be made to cancel part of the debt through the export of manufactures and raw materials to creditor nations. Several successful barter deals have already been arranged with the Soviet Union and Yugoslavia during the last year.

APRA justifies this approach to the debt question on the grounds that (1) Peru cannot pay; (2) IMF medicine offers no cure to an economy suffering from recession accompanied by high inflation; (3) the social and political costs are excessive; and (4) refusing to sign an IMF stabilisation package brings no major disadvantages—whatever happens, Peru will experience difficulty in attracting foreign capital, and, come what may, some financial institutions will be willing to make loans. Obviously, the danger exists that as a result of APRA policy, the Peruvian economy will be starved of funds. In the present financial climate few international banks would be willing to increase their

³⁵ *Washington Post*, 17 April 1985; *New York Times*, 23 April 1985.

³⁶ *El Comercio*, 29 July 1985.

Peruvian exposure without a green light from the IMF. This could seriously hinder the government's aim of attracting additional foreign investment and reactivating the industrial sector. Aware of the problem, Alan García has tried to court Arab banks, but it remains doubtful that these will be willing to loan substantial sums to Peru. The government also hopes to pay off a quarter of the foreign debt through barter agreements, and again this target looks optimistic given the present world recession.

Various commentators have called García's approach to the debt problem 'the most audacious attack on the world financial system since the current debt crisis broke three years ago'.³⁷ This is something of an overstatement. The Belaúnde administration started to ignore IMF agreements and stopped honouring most of its interest repayments in July 1984. One exception to this was a US\$52 million payment made in January 1985 to avoid a 'value impaired' classification being slapped on Peru by the US banks.³⁸ By June 1985 Peru owed creditor banks approximately US\$600 million in outstanding interest, with arrears rapidly accumulating at a rate of US\$42 million per month. Peruvian exports currently stand at around US\$3.1 billion, so the 10 per cent of export earnings García has pledged to pay off debts amounts to US\$300 million a year, roughly the same level of servicing made by the Belaúnde government in 1984. To a large extent, therefore, García's radical posturing in effect means no significant departure from existing practice. APRA has a forty-year history of voicing anti-imperialist rhetoric while simultaneously conciliating with foreign and national capital. Moreover, Alan García and the first Vice-President Luis Alberto Sanchez are on the right wing of the party. Taking these factors into account there is no reason to assume that the present administration will not eventually be forced to come to terms with the IMF and the international banks on conditions far harsher than it would have wished. One other possibility is that the APRA government will end up implementing an IMF-style policy without the IMF. There are already signs that this will emerge.

With respect to the industrial sector, APRA intends to reactivate the economy in an attempt to boost internal demand, reduce idle capacity (most factories are currently running at 40 per cent capacity) and raise

³⁷ *Latin American Monitor* (2) 6 August 1985. *The Times* (London) has also stated that García's proposals represent 'the most daring challenge to existing monetary rules since the start of the Latin American debt crisis three years ago' (30 July 1985).

³⁸ *New York Times*, 24 June 1985.

employment levels. The *Plan Perú* aims to create four million new jobs over the period 1985 to the end of the century. To assist recovery, tariffs have been raised on a wide range of imported manufactures and luxury goods. Wage rises averaging a paltry 18 per cent were agreed with civil servants, teachers and some private sector workers on 1 April 1985.³⁹ While this increase compensates for only two months inflation, Finance Minister Luis Alvo Castro hopes that it will help boost consumer demand. Nevertheless, Keynesian reflation in the present Peruvian situation threatens rampant inflation. Over the twelve months commencing June 1984 Lima prices rose by 168.8 per cent and are currently approaching an annual rate of 200 per cent. The incoming government has tried to put a brake on inflation by freezing food and rent prices. As part of the government's psychological war on inflation, President García has been making regular television appearances to announce price reductions agreed with industrialists. Thus, Nicolini, the nation's largest pasta producer, has broadcast price cuts on a number of its products. Cement manufacturers and some drug companies have followed suit.⁴⁰ The government has not given the same degree of publicity to the financial handouts given to these enterprises in return for their co-operation. In effect a return to the food subsidy policy of the Velasco regime is being introduced in an *ad hoc* fashion. Parallel with these measures, the government has resorted to other mechanisms aimed at reducing inflation by lowering the cost of borrowing for industrialists. Banks were closed on 30 July to 1 August, during which time dollar bank accounts were frozen in a first move to de-dollarise the economy. On 2 August interest rates paid on deposit accounts were halved, with the ceiling on time deposits, capitalised monthly, being reduced from 125.6 per cent to 58 per cent. Simultaneously, the central bank fixed the interest rate on late loans for up to 360 days at a ceiling of 110 per cent, down from 280 per cent. For loans over 360 days the top rate is to be 120 per cent.⁴¹ These measures reversed a 30 per cent increase in effective interest rates and cuts in food and fuel subsidies decreed by the outgoing Belaúnde government.

Prior to undertaking these anti-inflationary policies, the currency was devalued by 10.7 per cent in an effort to boost exports. No further devaluations are supposed to occur for ninety days. Gasoline prices were increased by 14 per cent. It is hoped that this strategy of

³⁹ *El Comercio*, 2 August 1985.

⁴⁰ *ibid.*, 12 August 1985.

⁴¹ *Latin American Monitor*, August 1985.

announcing steep price rises followed by a freeze will break, or at least significantly dent, the inflationary spiral. Under present circumstances this gamble has a slim chance of success. Moreover, with state revenue still heavily dependent on the petrol tax, the government will be forced against its will to regularly increase this, with inflationary repercussions for the whole economy. Given the widespread lack of confidence in the national currency induced by a decade of economic crisis and devaluation, the government's attempts at de-dollarisation will encounter much resistance. Finally, a question mark hangs over the technical competence of APRA's economic policy-making team. The majority of Peru's best economists support Acción Popular, the PPC or IU.

On 3 June 1985 the Sociedad Nacional de Industrias, the Peruvian employers' federation, launched the idea of a social pact between capital and labour, which it claimed would help the country climb out of the crisis, create more jobs and improve social security provision for workers. This proposal received backing from the *aprista* labour confederation, the Confederación de Trabajadores del Perú as well as prominent APRA politicians.⁴² It seems certain that García will try to foist a Peruvian equivalent of the *Pacto de Moncloa* onto the labour movement as part of his anti-inflation strategy. The communist-dominated Confederación General de Trabajadores del Perú (CGTP), the largest union confederation, has rejected such overtures.⁴³ Currently the left-dominated unions are bracing themselves for an inevitable confrontation with APRA. The government party is set to attempt to regain the influence among organised labour that it lost to the left during the Velasco era and bring workers under corporatist control. In this battle, like the forthcoming struggle to oust the left from control of the student movement, APRA will not most likely abandon its newly adopted dove-like posturing and resort to the more traditional methods of pistol, knife and club. These tensions are unlikely to promote industrial peace, or make a social contract with labour workable. The quinquennium 1985-90 will, in any case, be a real test of the left's implantation inside the organised labour movement.

Agriculture development holds a key position in APRA's medium- and long-term strategy for combating inflation and reactivating the economy. It is also a crucial sector considering that the García

⁴² *El Comercio*, 4 June 1985 and 6 June 1985. Also see the interview with APRA trade union leader and senator Luis Negreiros published in *Caretus* (853) 3 June 1985.

⁴³ *El Comercio*, 15 June 1985.

government has pledged to pursue a basic needs policy aimed at providing cheap food for the poorer strata of the population. At present, Peru imports a large proportion of its food requirements and given the continuous mini-devaluations implemented by the Belaúnde administration, prices in terms of *soles* were constantly increasing. To break this cycle, APRA has made agriculture a priority and will endeavour to make Peru as self-sufficient in foodstuffs as possible.⁴⁴ Diverting credit to the agrarian sector, it is argued, will raise domestic food production, ultimately lead to lower food prices, reduce unemployment and underemployment, in the process bringing about an increase in consumer demand. To attain these objectives, mid-August 1985 saw import restrictions placed on dairy products, meats, grains and coffee. Farmers have also been promised improved prices by the new Minister of Agriculture, Mario Bartuén Dueñas. Protection and guaranteed prices will, it is hoped, foment significant increases in the domestic output of milk, beef and wheat. The nation is particularly deficient in wheat production and Bartuén has introduced guaranteed prices with the aim of raising output from approximately 80,000 tonnes per annum to 400,000 tonnes. National consumption approximates 700,000 tonnes.⁴⁵ The Minister also wants to encourage a change in consumption patterns, away from *pan francés*, which is mostly made from imported white flour, to *pan serrano*, which is wholemeal and produced from domestically grown softer grained wheat. Twenty per cent of the nation's annual potato crop, or about 400,000 tonnes, is to be purchased at guaranteed prices in an attempt to avoid current shortages in this commodity. Export incentives are also to be given to potato and cacao producers, as well as fruit and flower agribusiness. The ministry will also attempt to get the Nestlé Corporation to make changes in the form it markets its milk products. The APRA government intends to cut back on the production of fishmeal and increase the supply of fresh fish and canned fish for human consumption. A propaganda campaign will be launched to encourage the population to eat more fish and less red meat.

To boost agriculture the APRA administration has declared that commercial banks will be required to allocate at least 20 per cent of their loan portfolio to the rural sector. In a move designed to encourage farmers to take credit, the existing procedure of giving land as collateral is to be scrapped. Instead the crop itself will become the bank's

⁴⁴ Speech of García reported in *Hoy*, 16 July 1985.

⁴⁵ *Latin American Weekly Report* (London) 23 August 1985.

guarantee. Tariffs on the import of agricultural machinery and spare parts are to be reduced with the intention of stimulating rural mechanisation. Government policy with respect to the high cost of fertilisers and pesticides is not clear at the time of writing.

While many of these policy objectives are laudable, they are not without their contradictions and difficulties. An obvious danger exists that improved agricultural prices will fuel inflation, in the process raising wage costs, reducing profits in the industrial sector and so ultimately stifle the hoped for expansion in domestic manufacturing. The state has meagre financial resources and this scenario cannot be avoided via a policy of widespread subsidies to farmers. The promise to direct more credit towards agriculture may also worsen the liquidity problems already besetting industrial enterprises, especially if friction with the international banks over the debt question makes funds scarcer. Moreover, in the past agriculturalists have voiced more complaints about the amount of paperwork involved in securing a loan and bureaucratic incompetence at the Banco Agrario rather than the unavailability of credit *per se*. No clear statement on how these bottlenecks are to be overcome has yet been forthcoming. Lowering tariffs on imported farm machinery threatens to have a detrimental impact on domestic manufacturers of these items. Finally, the government's efforts to change established food consumption patterns in the cities will meet strong resistance. Since the 1930s several Peruvian governments have attempted this, none of them with success.

Minister Bartuén has stated that existing agricultural production cooperatives will remain, but where members want to divide enterprises they will be given permission to do so. Service cooperatives are to be encouraged. With respect to the sugar cooperatives, the pride of the Velasco agrarian reform, Bartuén would like to offset the impact of falling demand and low world sugar prices by starting fuel-alcohol production on the Brazilian model.⁴⁶ The sugar cooperative's debt of approximately US\$150 million is to be renegotiated. In return the ministry will be seeking improved work discipline, increased productivity and changes in the cooperatives' internal organisation. One 'reform' the minister is apparently seeking is the abolition of trade unions, which he has reportedly described as 'an absurdity inside a cooperative'.⁴⁷ In fact anyone with even the slightest knowledge of the turbulent history of the sugar cooperatives during the military *docenio*

⁴⁶ *ibid.*

⁴⁷ *ibid.*

and the Belaúnde administration knows that the unions are essential for defending workers' rights. The minister's keenness to abolish the unions may be due to the fact that the left have ousted *apristas* from their traditional positions of leadership in several cooperatives, and have been in the forefront of a struggle to get corrupt administrative staff, most of whom are *apristas*, removed from their posts. If the ministry does proceed with the idea of deunionisation, some bitter confrontations can be predicted in this the leading branch of Peruvian agriculture. Violent clashes are also likely to develop as APRA strives to regain its former undisputed hegemony in the sugar workers' union and submit it to government control. This atmosphere is hardly one designed to encourage greater labour effort.

Four other important areas of APRA policy relate to official corruption, treatment of the guerrilla question, arms expenditure and foreign policy. APRA made the attack on corruption a major plank in its election campaign. The García government has promised a complete overhaul and reorganisation of the *guardia civil* and the plain-clothes branch of the police force within sixty days of taking office. Individuals involved in corrupt dealings are to be dismissed and put in the hands of the courts.⁴⁸ The existing penalties for people found guilty on charges of corruption are to be doubled. Similarly, with respect to the state bureaucracy, a clean-up campaign is to be conducted. APRA has also promised to desist from placing party members in government jobs. This practice brought the Belaúnde administration much public hostility. Instead APRA has stated that all honest and efficient public employees will retain their posts, while only the highest echelons of the public administration will be staffed with party militants. Again, these good intentions are to be applauded and are measures long overdue, but their successful implementation will be extremely difficult. After decades of waiting, party appetites will be difficult to contain. Neither has APRA broken all links with the cocaine mafia.⁴⁹

Since opening armed operations in 1980 the guerrilla movement in Peru has not only survived, it has managed to grow in strength. This issue threatens to be one of the most complex and intractable the newly elected *aprista* government faces. As yet the government has not

⁴⁸ The reorganisation of the police force and an attack on official corruption may well have been facilitated by the explosion of a large capacity cocaine kitchen in Lima on 24 July 1985. Implicated in this affair is an ex-prime minister in the Belaúnde administration, Luis Percovich, and over twelve high-ranking police officers. *ibid.*, 16 August 1985. On 19 August forty-one top policemen were fired, including twenty-one of the civil guard's fifty-three generals.

⁴⁹ *Caretas* (861) 30 July 1985.

formulated a coherent medium-term strategy. Alan García appears to favour a tough line, combining a military solution with state investment in Ayacucho and other zones of heavy guerrilla activity. Development projects, it is argued, will lessen support for the insurgents. Other prominent *apristas* situated on the left of the party like Armando Villanueva and Javier Valle Riestra, would like to see some kind of amnesty offered to guerrillas who lay down their guns, e.g. a policy very similar to that being pursued by Felipe González with respect to ETA. Given that he copies so much from the Spanish Prime Minister, Alan García may well come out publicly in support of this strategy. Indeed, it is already being implemented by the Peruvian army in some zones. Few of the people fully integrated into the guerrilla ranks, as opposed to those on the periphery, are likely to be attracted by such olive branches, and the likelihood is that the rebels will continue to plague García throughout his five years in office. If this occurs, cut-backs in the military budget will be harder to achieve. On this question the new government has got off to a positive start by reducing the number of new Mirage 2000 jets Peru is set to acquire this year from twenty-six to fourteen. García is also keen to get the Latin American states to agree to regional arms control. In the international field it can be expected that the APRA government will follow the Mexican example, i.e. a progressive foreign policy will be pursued to give the regime a positive image abroad. Already the newly elected president has launched attacks against the Reagan Administration's Central America policy. García has come out strongly in favour of Nicaragua and has expressed a willingness to join the Contadora group. Peru is likely to continue its support for the Non-Aligned Movement.

Conclusion

The relatively trouble-free election campaign followed by a smooth changeover of government implies a consolidation of democracy in Peru and a break in the cycle of military intervention that has long beset Peruvian politics. This encouraging development is taking place under difficult circumstances. The recently elected APRA administration faces the daunting task of governing a society in the throes of deep social and economic crisis. It is to be hoped that García's term in office will bring some improvement in the appalling living conditions of the majority of Peruvians. However, the experience of the Mitterrand government in France and González in Spain suggests that the heightened aspirations encouraged by APRA's populist rhetoric

and nationalism will not be satisfied. If this occurs, then the government is in danger of undergoing a process of *desgaste*, or a gradual decline in support accompanied by falling morale within the ruling party, similar to that which afflicted the Belaúnde regime. With García constitutionally barred from standing for re-election in 1990, competition among APRA politicians for the presidential nomination is also likely to become intense after 1987, further destabilising the political environment. In such a situation the probability of military intervention significantly increases, unless the Peruvian right can reorganise and rejuvenate itself. A question mark consequently hangs over the solidity of Peruvian democracy, even though the prospect of a *coup* currently seems remote.

If APRA is to attain its goal of converting itself into the automatic party of government and avoid being ousted at the end of the decade either through the ballot box or at rifle point, it needs to take firm control of the state machine and embark on a corporatist project, imitating as far as possible the PRI in Mexico. Already sectors within APRA have expressed a desire to take the party along this path. In many respects APRA provides the most promising political option available to businessmen in town and country, given the inability of the Peruvian right to establish lasting and stable parties capable of attracting significant support among the lower classes. Nevertheless, other branches of civil society, such as the unions, could prove more difficult to co-opt. In addition, anti-*aprista* sentiments among individuals occupying all points of the political spectrum have not been erased by the April election. Any corporatist project would also have to overcome the opposition of a large and relatively well-organised left, or at least a section of the currents presently inside IU. For these reasons, the establishment of an authoritarian democracy centred on APRA would be problematic.

Whichever of the two most likely scenarios unfolds, by the time municipal elections are held in 1986 it is likely that the APRA governments will appear neither 'revolutionary' nor 'popular'. Beleaguered by great economic difficulties, the chances are that it will be implementing a stabilisation policy, with or without the IMF. All talk of García wresting 'the leadership of left-wing Latin Americans from Fidel Castro' will have been quietly buried as his government faces mounting social discontent and an ongoing guerrilla war.⁵⁰

⁵⁰ *The Sunday Times* (London) 28 July 1985.

Bolivia at the crossroads

The general election held in Bolivia on 14 July 1985 was a remarkable event in a number of respects. First, and most obviously, it served to fortify the tenuous consolidation of parliamentary democracy, re-established in 1982 after eighteen years of military rule in a country notorious for political instability and the belligerence of its armed forces. Of the Latin American countries ruled by dictatorship in the 1970s only Peru and Ecuador had subsequently managed to effect a hand-over from one civilian president to another, and neither of these states had experienced the sharp autocracy suffered by Bolivia in the previous decade. However—and this is perhaps a more than casual phenomenon—in all these countries it was the opposition that won the second post-dictatorial election and proved able to assume power through constitutional means; this is the first time such an event has occurred in 160 years of independent Bolivian history. Thus, the second successive constitutional transfer of power in the sub-continent's most unstable state undoubtedly assisted the general anti-militarist movement in the region as a whole, further isolating the regimes of Pinochet in Chile and Stroessner in Paraguay, long accustomed to exchanging ideological succour with military rulers in La Paz.

Unlike the cases of Peru and Ecuador, the Bolivian poll produced no new faces or political forces. Indeed, it may properly be viewed as the last major political contest of a generation that rose to prominence in the 1940s, organised the 'national revolution' of 1952 under the leadership of the Movimiento Nacionalista Revolucionario (MNR), and, after a concerted drift away from its radical origins and into self-serving autocracy, was displaced from power by the military in 1964.¹ The winner of the 1985 poll, Víctor Paz Estenssoro, has been *Jefe* (Chief) of the MNR since its establishment in 1941 and is now embarked upon his fourth term as President in nigh-on fifty years in public life. The outgoing President, Hernán Siles Zuazo, leader of the MNR de la Izquierda (MNRI), had previously been President twice and personally led the three-day insurrection of April 1952 that defeated the army, and created the government which nationalised the strategic tin mines of a three-family oligarchy (Patiño, Aramayo, Hochschild), introduced an

¹ For a detailed narrative survey of this period see James Dunkerley, *Rebellion in the Veins: Political Struggle in Bolivia, 1952-1982*, London: Verso: 1984.

agrarian reform, and granted universal suffrage. Thus, although Víctor Paz has inherited an economy in a state of collapse far worse than previously seen this century, and despite the fact that both he and his party have entered into occasional alliances with military rulers over the last fifteen years and are demonstrably more conservative than the Siles faction, few major changes of style or substance in policy are imminent.

The severe deflationary measures introduced on 29 August 1985 within three weeks of Paz's assumption of power were notable less for their devaluation of the peso (by 95 per cent), increases of basic food prices by some 500 per cent and that of gasoline by 1,000 per cent than for the freezing of all wages for a period of four months. Siles had himself frequently resorted to traditional austerity measures, but he also permitted compensatory wage rises although these generally followed strike action. Paz will be more resolute on this issue, but it remains far from clear whether he will force it to the point of a complete rupture with the unions and the need for comprehensive repression.

In the immediate aftermath of the poll, the view that Bolivian political life advances in backward-looking cycles was generally prevalent in La Paz. Such an impression was significant strengthened by the continued dominance of the trade union movement by Juan Lechín Oquendo, Vice-President to Paz in the early 1960s, leader of the powerful miners' union (FSTMB) since its foundation in 1944, and executive secretary of the Central Obrera Boliviana (COB) without interruption (even when both he and the organisation were outlawed) since the COB was established in 1952. Since the COB commands the support of virtually all national unions, both urban and rural, and was instrumental in forcing the military from power in 1982, Lechín's role of radical shadow to his old colleagues in the MNR has been critical and is likely to retain its importance despite the widely recognised failure of the parties of the left in the recent period. The public longevity of these figures can undoubtedly be ascribed to the importance of the 1952 revolution, which instituted the basic reforms that underlie the present parliamentary system and established a state-dominated economy that even the most right-wing military rulers have held back from dismantling. Nevertheless, there are many signs that the political epoch begun in 1952 is now drawing to a close despite the tendency of both voters and deputies to opt for what was widely dubbed the *mal menor* (lesser evil) in the 1985 poll and subsequent parliamentary vote for the presidency. In a time of acute economic hardship such a choice is not perhaps highly surprising, but apart from the fact that Víctor Paz is

seventy-eight and his counterparts all septuagenarians, it is clear that the 1952 system was itself in many respects responsible for the present crisis and largely unable to respond to it. As a result, it has come under a strong challenge, particularly from the right-wing *Acción Democrática Nacionalista* (ADN), led by ex-dictator General Hugo Banzer Suárez (1971–8).

The fact that in 1985 Banzer gained 29 per cent of the popular vote only seven years after completing what was one of Bolivia's harshest and most concerted periods of military rule underlines the fragility of the old MNR concordat. Indeed, it was only a hastily assembled parliamentary alliance of various factions of the old MNR as well as the grudging support of several deputies of the left-wing and Indian parties that enabled Paz, who had won 26 per cent of the popular vote, to overcome in Congress Banzer's voluble claims to office on the basis of a relative majority. Paz, therefore, gained the presidency less on his own merits than as the most viable candidate to thwart Banzer, without a working congressional majority, lacking great support in the cities (where the ADN did particularly well, most notably in La Paz), and with a very vague programme that was in key respects identical to that of his major challenger.² Assisted by what was generally perceived to be a weak and heterogeneous cabinet, assembled to retain an optimal intra-party coalition, it was expected that he would restrict himself to maintaining the status quo and confront the economic crisis in a much less comprehensive fashion than essayed by García in Peru and Alfonsín in Argentina.³ It is a telling reflection on the state of the new administration and Bolivian political life as a whole that once the predictable flurry of coup rumours had passed, attention turned to the

² Both the ADN and the MNR pledged to introduce a 'single, realistic' exchange rate, which would require a devaluation of at least 100 per cent, renegotiate the external debt with the private banks and the IMF, attack the cocaine trade, reduce trade union power, and revive agro-industry. Both parties laid stress on social order although Banzer did so in a markedly more muscular fashion, suggesting the use of coercion against opponents.

³ Paz's cabinet includes a number of notable collaborators with right-wing military regimes (Luis Fernando Valle, Guillermo Bedregal and Guillermo Riveros) as well as respected opponents of recent dictatorships, such as German Reynaldo Peters and Sinforsó Cabrera, previously a leading militant of the miners' union, Trotskyist sympathiser and the only member of the government who could be plausibly presented as belonging to the left. The new President's efforts to appoint a member of the 1981 military junta, Admiral Oscar Pammo, as head of his military household were impeded by a high command that is perhaps the first in forty years to manifest political views more progressive than those of the civilian leadership. As a reward for its defence of the democratic process, Paz has reconfirmed the military leadership, headed by General Simón Sejas, until the end of 1985. Support for Banzer from the ranks of colonel and general was notably lacking since Siles had promoted those officers who had a record of opposing him and arguing for a return to parliamentary democracy.

prospects of the strong ADN opposition effectively 'besieging' Paz in order to make an uncontrollable thrust for power at or before the next poll. It should not be forgotten that manipulation of parliament has been used before both to prompt coup attempts and to paralyse the executive power. Both the MNR and the ADN used Congress to deny Siles power in 1979, an act which resulted in three military insurrections in less than a year. Moreover, over the last three years, when these parties also enjoyed a combined parliamentary majority, Congress passed not one single piece of legislation and occupied itself primarily with impeaching Siles's ministers. Thus, the existence and formal functioning of parliament is in itself only a partial advance and must be considered within the context of a genuine proclivity to abide by the unwritten rules of constitutionalism. The evidence that this exists after the 1985 poll is still open to considerable doubt.

Naturally, observations such as this, however prevalent they might be, should be treated with a modicum of caution and respect for the rapidly shifting circumstances in political life. Moreover, in Bolivia executive power has generally prevailed over that of parliament, at least in the short term, and Paz is an experienced statesman keenly able to exploit the advantages of office. Equally, the strong ADN vote was manifestly one of censure both of the inept and inactive Siles regime and of the left, which both in and out of government had offered few solutions to the economic crisis, had organised a series of prolonged general strikes that contributed to a rising sense of public disorder, had gained only limited economic advances for the working class and peasantry, and had offered no new political initiatives. It is undoubtedly the case that many who participated in these strikes and consider themselves faithful militants of the COB voted for Banzer. Whether they might do so again depends on the ADN's distinctly precarious attachment to parliamentary democracy and its ability to sustain a heavily dollar-funded campaign redolent with evocations of the heady days of economic expansion and 'public order' in the 1970s, when Banzer exploited the oil price rise to contract the debt that subsequently undermined Siles's Unidad Democrática y Popular (UDP) alliance. It is the view of the left that Paz cannot possibly provide a solution to the structural crisis that the Bolivian economy is suffering. However doctrinaire this may sound, it is probably a correct interpretation. Nonetheless, if the new government simply manages to hold the fort and preside over a situation that does not significantly worsen it is likely that Banzer will lose a large proportion of his fair-weather constituency.

throwing him back on to the support of a diehard nucleus of anti-communist activists for whom, as was palpably evident before and during the election campaign, parliamentarianism is one method amongst several for obtaining power. The Banzer campaign was one fought on television, through motorcades of private vehicles, the services of paid unemployed youth to plaster towns with multicolour posters and carefully orchestrated public events at which mass participation was markedly absent. His votes came from people who throughout all this stayed at home, normal urban folk who abstained from militancy but were evidently determined to vote against the inactivity and incompetence of the last three years.

The failure of the left to provide an answer to the economic crisis certainly diminished the support it has historically enjoyed as a result of a strong popular sentiment of anti-militarism in Bolivia. It was this factor that lay behind the victory of Siles and the UDP (combining the forces of the MNRI, the pro-Moscow Partido Comunista de Bolivia, and the Movimiento de la Izquierda Revolucionaria) in the elections of 1978, 1979 and 1980. In each instance it was denied office—by fraud, congressional veto, and a military coup—with the result that between 1978 and 1982 the country had ten presidents and suffered five coups. The front thereby built up a considerable wave of popular support that reached a peak following the July 1980 coup of General García Meza, who attempted a *pinochetazo* with the aid of the Argentine military and generous funds from the cocaine trade. García Meza's reliance upon widespread repression, his failure to gain support from Washington because of strong links with the drug trade, the progressive division of a demoralised and badly tarnished military, and the rising economic crisis exacerbated by the diplomatic boycott and carefree spending, produced a situation whereby the accumulating mobilisation of the COB combined with the virtual US blockade to oblige the right into acquiescing in the UDP's assumption of office, finally realised in October 1982. In many respects García Meza and his short-lived successors in the junta are responsible for the re-emergence of Bolivian constitutionalism, and however calamitous the experience of the UDP administration, throughout its truncated mandate it maintained a notable respect for civil liberties that qualified and occasionally halted accumulating popular discontent. This aspect of its rule is likely to acquire greater attention as the economic crisis continues and the extraordinary difficulties of containing, let alone placating, a highly politicised and traditionally militant labour

movement return after the natural 'pause' in public life brought about by the elections. Those with a sharp political memory recall that although Siles was president in 1956 when the US government and the IMF made the reconstruction of the army (whose defeat he had led) a central condition for critical balance-of-payments assistance, it was Paz who had carefully accelerated this process, chose a military officer as his running mate in 1964, and backed Banzer's bloody coup in 1971.

However, in 1985 such a memory was subordinated by the reality of a state of affairs so severe that the term *bolivianización* has entered the argot of contemporary Latin America as representing a condition of absolute economic decomposition, a kind of nightmare example of what the debt crisis can lead to. Thus, although the country has not suffered anything approaching the levels of violence and social breakdown evident in Peru, it stands alone in terms of the financial indices of the present crisis. In August 1985 inflation was officially declared to exceed 14,000 per cent per annum whilst the far from politically disinterested private enterprise federation declared it to be at least 50,000 per cent. This is undoubtedly an exaggeration but at such levels it is of relatively marginal importance—the country is patently suffering a profound process of hyperinflation with prices changing daily and, on occasions, hourly.⁴ In a futile effort to stem this the peso was devalued by 250,000 per cent between 1980 and 1984, yet at the end of Siles's administration the official exchange rate of 175,000 pesos to the US dollar compared with an informal rate of 1.1 million at which almost every internal transaction was conducted. As a result, both high- and low-level speculation soared and severely distorted the economy. With massive dollar savings available on official tariffs luxury imports rose alarmingly and contraband became generalised. Assisted by the size of another 'informal' sector—cocaine trading—this process effectively 'dollarised' the economy, further undervalued the peso, encouraged a secular inflation of expectations, and cut a swathe through the living standards of those workers and peasants whose peso earnings lagged far behind price rises (which by mid-1985 were clearly outstripping the rise in the price of the dollar).

The fact that such a crisis is indeed structural and not some short-term

⁴ Instituto Nacional de Estadística, 16 August 1985. All the figures cited below are derived from statistics issued both by this office and the Banco Central de Bolivia. Some are necessarily estimates and err on the side of conservatism but they remain generally more accurate than the figures issued by international organisations. I am grateful to Rolando Morales, former Sub-Secretary of Finance and currently President of the College of Economists, for his assistance with this section.

speculative seizure is reflected in a fall of national production by 16 per cent and of disposable income by 25 per cent between 1980 and 1984, an extraordinary reduction of nearly 60 per cent in imports (the third largest import now being bank notes), and 75 per cent in investment over the same period. Bolivia has consolidated its position as the poorest country in the western hemisphere with the exception of Haiti, with an infant mortality rate of at least 168 per thousand live births, half its children clinically malnourished (and 61 per cent suffering from goitre), real unemployment of between 40 and 50 per cent, and 60 per cent of a still predominantly rural population living well beneath the poverty line (infant mortality in the countryside is reliably assessed to be 210 per thousand live births).⁵ According to informal USAID estimates some 8 per cent of the population emigrated between 1982 and 1985, principally to neighbouring states. These new 'economic refugees' join approximately one million Bolivians—over one-sixth of the total population—working abroad. It can, therefore, be said without exaggeration that the great mass of Bolivians live in conditions more proximate to those in the Sahel than to those in Argentina; hunger and its related diseases are easily the single most important cause of death.

Illustrative statistics could be multiplied endlessly (and include examples of those sectors, national and foreign, who have done exceptionally well out of the crisis), but what manifestly lies behind the recent crisis is a combination of a failure to pay a towering external debt and a sharp decline in export earnings from the mining industry, particularly tin, traditionally the country's strategic commodity in an uninterrupted attachment to the policies of 'export-led growth'. The richness of local tin ore has been declining since the third decade of the century and is now at a critically low level, but this has been less important than the excess world supply and subsequent fall in prices, impeding capital investment that would enable concentration of poorer

⁵ For details of the economic crisis and its impact on the health of Bolivians see Rolando Morales, *Desarrollo y Pobreza en Bolivia*, La Paz: UNICEF, 1984; *La Crisis Económica en Bolivia y su Impacto en las Condiciones de Vida de los Niños*, La Paz: UNICEF, 1985; José Luis Roca, *Derrotemos al Hambre*, La Paz: UNICEF, 1985. Despite this depressing state of affairs, mention should be made of the remarkably successful popular health campaigns organised by Siles's Minister of Health, Javier Torres Goitia, which resulted in nation-wide educational programmes and vaccinations. Significantly, in the election all political parties praised this feature of the UDP government. Bolivia also possesses a small but distinguished community of young and pioneering paediatricians based at La Paz's Hospital del Niño who have made important progress against malnutrition through innovative oral rehydration programmes. Much to the consternation of the US embassy, under Siles the Cuban Ministry of Health lent strong support to this team.

ores as well as depriving the exchequer of critical foreign exchange. At the end of 1983 the world surplus of tin stood at 70,000 tons whilst over the previous three years Bolivian production fell from 22,000 to 14,000 tons. Earnings from all mineral exports over the same period dropped from \$646 million to \$348 million.⁶ Although Bolivia is an oil-producing nation and evaded the full impact of the recession of the mid-1970s largely as a result of this, petroleum exports ceased in 1977 and lack of capital for exploration has raised the threat for the first time in several decades of the need to import gasoline. This will further prejudice a balance of payments which, despite huge cuts in imports, was thrown completely out of kilter by the fall of mineral prices at the beginning of the 1980s, reducing total export earnings from \$1.1 billion in 1980 to \$788 million in 1984.

The one important caveat to such a picture is the existence of the cocaine trade, which enjoyed buoyant prices between the mid-1970s and 1984. It is estimated that the export earnings of this illegal industry have averaged \$1 billion a year over the recent period even though Bolivian traders are generally excluded from the final, and most lucrative, phases of commercialisation in the US and Europe. Because the primary constituent of this commodity is the legally cultivated coca leaf, chewed for centuries in the Andes, the 'trickle-down' effect of the current cocaine boom has been appreciable and benefited not just the inhabitants of the Cochabamba valley system (its principal centre) but also thousands of migrant labourers from the rest of the country who can earn up to ten times the average wage by treading or transporting the leaf. Reliable estimates put the number of people who have direct or indirect contact with the cocaine trade at 10 per cent of the economically active population.

However, the fact remains that this is a highly precarious and dangerous occupation in an illegal industry still firmly dominated by a mafia that is subject to no legal obligations, has never shown itself disposed to redistribute the fabulous profits it makes, and pays absolutely no dues to the state other than the residually necessary bribes to local officials. Hence, the Bolivian state finds itself unable to tax the most successful national export at a time of unparalleled fiscal crisis.

⁶ Between 1980 and 1983 the prices of Bolivia's principal mineral exports fell as follows: tin, from \$7.6 per lb to \$6.0; copper, from \$0.97 per lb to \$0.75; silver, from \$21.05 per ounce to \$11.40; zinc, from \$0.40 per lb to \$0.33; wolfram, from \$141.62 per metric ton to \$80.66; antimony, from \$3,925 per metric ton to \$2,044. Yvon LeBot, 'L'Experience de cogestion a majorité ouvrière (1983-84): entre l'utopie ouvrière et le déclin minier', *Problèmes d'Amérique Latine* (73) 1984

and to date it has signally failed to capture any of the leading traders although insistent US pressure, notably through threats to cut aid, has led to a number of army raids in which humble peasant workers are frequently apprehended or shot. While Washington continues to urge destruction of the *cocales* without presenting anything approaching an adequate alternative for the thousands who make their living from them, the trade continues unabated with a minor proportion of its dollar earnings returning to the country to further destabilise the embattled peso. Rather than constituting a potential solution to the crisis, *narcotráfico* has become the source of great fortunes for a few already rich farmers and the means for survival for impoverished peasants and workers. It is but the largest sector of a burgeoning informal economy as the rest of Bolivia's legal productive structure grinds to a halt.⁷

It is often alleged that the initial capital outlay for the current cocaine boom came from generous grants made by Banzer through the Banco Agrícola to local farmers in the department of Santa Cruz; to date some \$66 million of this debt remains outstanding and unaccounted for. Under Banzer Bolivia's external debt rose from \$551 million to \$3 billion, with a rising proportion being disbursed by the private banks lured by the high export earnings that resulted not from increased production but the short-term price rises of the mid-1970s. Today this debt stands at \$4.8 billion, which is unimpressive when compared to those of Mexico, Brazil and Argentina but equally if not more severe when one takes into account the size of the country's population, the rapid diminution of an already slight and vulnerable productive base, the collapse of export earnings, and the clear impossibility of further reducing imports of capital goods.⁸ Moreover, Bolivia has been faced with abnormally harsh terms of repayment, even by Latin American standards.⁹ As a result, the Siles government sought a particularly comprehensive and radical attitude to the debt question in the meetings at Quito and Cartagena, arguing simply on the basis of Bolivia's inability to pay at the required levels rather than along the lines of a

⁷ For a more extensive discussion of the cocaine problem and reference to the limited bibliography see Dunkerley, *Rebellion in the Veins*, *op. cit.*, pp 308-25.

⁸ For detailed discussion of the Bolivian debt see *Dinámica Económica* (9) 1985, Various, *La Deuda*, La Paz: FLACSO, 1985; Various, *Perspectivas de la Política Económica en la Bolivia Post-Dictatorial*, La Paz: FLACSO, 1985; Fernando Baptista Gumucio, *Estrategia Nacional para la Deuda Externa*, La Paz: 1984.

⁹ In 1981 and 1982 the private banks demanded repayment at interest rates 2.19 per cent above LIBOR, which compared with a Latin American average of 0.98 per cent (the second highest rate being for Brazil at 1.62 per cent), over a period of five years and four months, whereas the regional average was eight years, Baptista, *Estrategia*, *op. cit.*, p 156

political repudiation of the international financial system. It was, in fact, the response of the COB rather than the government that determined the decision, taken in April 1984, to pay the private banks according to the availability of funds pending a new agreement, for which the regime suggested a total repayment at 25 per cent of export earnings.¹⁰ At the time this appeared to be a radical policy and was even seen in some alarmist sectors as presaging a regional moratorium; the banks pointedly refused to bargain, closed down their local offices, and cut off further funds. The subsequent attitude taken by the Peruvian government and statements issued by Presidents Sarney of Brazil and Sanguinetti of Uruguay make the step seem, in retrospect, far less audacious. Yet Bolivia was at the time alone and in a particularly vulnerable position. It is clear that the absence of further loans has done much to aggravate the crisis, but repayment at the levels required by the banks would most probably have done great damage and assuredly brought even local state operations to a halt.

In practice the Siles administration desisted from radical economic policies despite the presence in the regime of the PCB and the MIR. In the first weeks of its rule it took two measures which may be described as being independent of the IMF: the 'de-dollarisation' of the formal economy (prohibition of bank accounts in any currency other than the peso) in order to halt capital flight and to make the private export sector subject to inflation in the same way as wage-earners and local traders, and the granting of wage rises approximately equal to the level of inflation. However, at the same time it devalued the peso, cut state subsidies, and sought a traditional renegotiation with the banks—all in line with IMF precepts and directly prejudicial to the operation of the other measures. After introducing this first self-defeating confection, government policy was restricted to issuing further devaluations, reductions in state expenditure, and ordaining wage increases progressively lower than price rises.¹¹ International fears at the

¹⁰ The state continued to repay its debt to multilateral agencies (IMF, World Bank, Inter-American Development Bank etc) and sovereign lenders, albeit erratically and at a rate of around 17 per cent of export earnings. Payment to Argentina, a large lender during the recent dictatorship, has been complicated by that country's failure to reach an agreement on prices for imports of Bolivian natural gas, for which a barter agreement was made in principal. Nevertheless, relations with Argentina remain warm and President Alfonso attended Víctor Paz's inauguration (along with Presidents Betancur of Colombia and Sanguinetti of Uruguay) whilst Alan García was notably absent, causing a degree of comment in what is traditionally viewed as Peru's sister nation, only an hour and a half by air from Lima.

¹¹ In June 1985 the Siles government declared a minimum wage of 10.6 million pesos, equivalent to \$10.5, per month. A middle-level civil servant received at that time 25 million pesos and a specialist doctor in the state sector 60 million. A loaf of bread cost 80,000 pesos, a bottle of beer 250,000, a telephone call 5,000, an urban bus-ride 45,000, and a pair of shoes 10 million.

presence of communists in the cabinet waned as they were seen to possess no alternative strategy to that of the IMF and, in fact, to represent its most efficient managers even though throughout this period no global renegotiation of the debt took place.¹²

The COB's response to this situation was initially limited to verbal criticism—in part because the PCB retained a strong influence in the union movement—but by mid-1983 the pressure of its rank and file for action was too great to resist. In 1984 and 1985 Bolivia suffered six prolonged general strikes and a series of road blockades by a newly militant peasantry in protest at deflationary policies and a progressive loss of real wages. The cost of the debt contracted by Banzer and his military heirs first paralysed and then effectively destroyed the Siles government, which persistently refused to repress a popular movement that had hoisted it to power. In April 1984 Siles declared his unilateral solution to the debt, but when, in November of that year, a further three-week general strike brought the country to a halt it was clear that no further political space was available to the regime within which to manoeuvre. In what has become justly renowned as the *golpe eclesiástico*, the Church intervened and proposed the holding of new elections in July 1985, a year earlier than permitted by the Constitution. Without exception, the forces of the right supported this initiative, and Siles, whose reputation was now limited to the avoidance of conflict at all cost, acquiesced in an openly unconstitutional manoeuvre. Hardly was the ink dry on the agreement before both Banzer and Paz were staging expensive campaigns.

The record of the left inside the UDP government left much to be desired and subsequently led to a phase of sharp self-criticism, the removal of the PCB and the MIR from leadership positions with the COB, and the division of both parties early in 1985, by which time they had left government.¹³ Steeped for so long in a predominantly

¹² It is worthy of note that of the several UDP economics ministers, Ernesto Aranibar (MIR) and Horst Grebe (PCB) were the most malleable in their dealings with international financial organisations, and Grebe publicly lobbied on behalf of politically 'independent' ministers disposed to come to terms with the IMF. Both ministers were severely censured by the rank and file of their parties and eventually forced to resign although they were not replaced by hardliners.

¹³ The faction of the MIR led by Jaime Paz Zamora, who for much of the UDP government held office as Vice-President whilst his party was in opposition, follows a broadly social democratic line and aspires to renovating the MNR's old populism through a strictly electoralist strategy. The MIR-Bolivia Libre, headed by Antonio Aranibar, entered into an electoral alliance with the PCB as the Frente Popular Unido (FPU) and fought a more radical campaign based on explicit self-criticism of the UDP experience. The MIR-Masas, led by Walter Delgadillo, boycotted the elections and has taken a leadership role inside the COB. In July 1985 the PCB split and a strong opposition group, led by Ramiro Barrenechea and Carlos Soria, won the support of the entire

denunciatory discourse centred on democratic liberties, anti-militarism and anti-imperialism, this sector had patently failed to elaborate viable economic policies to be implemented on the rare occasions it had access to power. (Here one should perhaps note that up to García's victory in Peru the UDP administration was the only one of the post-dictatorial Latin American regimes to incorporate the traditional forces of the left). However, the non-government forces of the left that dominated the COB demonstrated equally limited political resources and concentrated simply upon opposing the government, the only real exception being the establishment of workers' control in the state mining corporation, COMIBOL. Thus, when in March 1985, the COB staged another, fortnight-long general strike and once again brought the country to a halt under an already lame-duck regime, the response of the population was to support the stoppage but also to demand a finite political alternative, for which abstract slogans for an unprepared 'assault on state power' were an insufficient answer. As a result, the expected solution in new elections took on added weight and the campaign of the right-wing was further fortified with attacks on 'anarcho-syndicalist subversion'. Divided, exhausted and corralled in policies of oppositionism against a government that was broadly viewed as being itself of the left, the left was destined for a humiliating electoral defeat.

This defeat has received much comment both in Bolivia and abroad, and was most obviously encouraged by Banzer's remarkably good showing at the polls. It must, however, be qualified. First, the poll was manifestly irregular and at times openly fraudulent. Every participating party, bar ex-Vice President Jaime Paz Zamora's faction of the MIR, claimed fraud, and the government itself detailed the irregularities committed by the electoral court (over which it had no executive control) well before polling day, which it then tried to postpone without success. While many of the accusations were obviously self-serving and almost ritualistic, it is clear that between 30 and 40 per cent of the rural population eligible (and indeed formally obliged) to vote was not

youth movement and significant local sections of the party in its critique of the pro-UDP leadership, which had failed to publish the critical resolutions of the party's Fifth Congress held earlier in the year. Following an extraordinary conference early in August 1985, both groups claimed to represent the authentic PCB, have expelled each other and issue alternative versions of the party weekly paper *Unidad*. For details of the labour movement over the recent period, see *Tendencias Sindicales después del VI Congreso de la COB*, La Paz: Cinco, 1985; Central Obrera Boliviana, *Documentos y Resoluciones de VI Congreso Nacional*, La Paz: Cepromin, 1985.

registered. Inefficiency accounts for a sizeable proportion of this, but the ADN's strong presence in electoral tribunals was also an important factor. Since rural communities traditionally debate and decide a collective vote before the poll and the great bulk of the peasantry was opposed to Banzer and in general disposed to vote for Paz as the 'lesser evil', such low registration can legitimately be interpreted as favouring the ADN, which was also proved to have engaged in other fraudulent practices in both town and countryside.¹⁴ The MNR, in its turn, made recourse to the full panoply of methods available to its practised electoral machine, but it benefited most directly from the logic of a broad anti-Banzer vote and even picked up the tacit support of left-wing COB leaders such as Juan Lechin and Filemón Escobar, who may be expected to resume the fierce opposition with which they confronted the UDP. The absence of any united left slate resembling that of the UDP and the imminent collapse of the governing MNRI, which would normally be expected to pick up many votes simply through patronage, further contributed to the success of the right. Nonetheless, a healthy 10 per cent of the vote went to the MIR, whilst the young and radical Partido Socialista-Uno, founded by Marcelo Quiroga Santa Cruz, Bolivia's most distinguished left-wing statesman, assassinated by García Meza in 1980, picked up seats against the run of voting, as did the Movimiento Revolucionario Tupaj Katari de Liberación (MRTKL), headed by peasant union leader Genaro Flores.¹⁵ None of these forces

¹⁴ The day before the poll I personally saw the electoral cards of a number of 'moles' placed in the ADN by the national peasant union, CSUTCB, signed by electoral judges (who were party militants) as having voted. These documents were presented to the Human Rights Assembly, which is due to publish a full report of its findings. Technically, registration is possible with the presentation of any one of six civil documents, easily facilitating multiple registration and voting at a number of different polling stations in an election conducted without the services of a computer. Against ADN accusations that 394 ballot boxes were 'disappeared' in the department of La Paz—a charge that was later disproved by the electoral court—the MNR produced evidence that in the same department there had been widespread voting by minors, some of whom were as young as eight years and had supposedly served as electoral judges. While the electoral court affirmed that this was the case, it caused widespread popular consternation by ruling that ballot boxes which contained less than a third of votes cast by minors should be counted as valid. For a detailed and vivid description of ADN malpractices in the departments of Pando and Cochabamba, see *Aquí* (La Paz) 20 July 1985.

¹⁵ The final allocation of parliamentary seats was as follows: MNR 59; ADN 51; MIR (Paz Zamora) 16; MNRI 8; MNR-*Vanguardia* 8; PS-15; FPU 4; PDC 3; MRTKL 2; *Falange Socialista Boliviana* 3. The collapse of the Christian Democratic Party (PDC) was notable, this currently very nearly being outvoted by the Trotskyists in the department of La Paz. There is not space here to discuss the important development of Indian political consciousness, particularly amongst the Aymaras of the highland region. There can be little doubt that while this has prompted the rise of a vibrant peasant 'trade unionism', recent developments have impeded a wider political representation of this current, most notably through the MRTKL, which was the principal victim of tactical voting for the MNR. The movement generally dubbed as '*katurismo*',

enjoyed anything remotely resembling the funds available to the MNR and ADN, which staged a modern US-style campaign that was partly funded by the Republican party and very much in the mould of Roberto D'Aubuisson's electoral challenge in El Salvador. Banzer's quasi-fascist trilogy of 'Paz, Orden, Trabajo' was at times prejudiced by the thuggery of his vice-presidential candidate Eudoro Galindo and the *pistoleros* around him, but its projection was sufficiently deft and carnivalesque not to dwell for long on the consequences of traditional IMF medicine, dismantling of the state corporations that control 60 per cent of the economy and provide extensive employment, or the natural means for acquiring 'order'.

Split between the call for a boycott, a number of small socialist parties, and tactical voting for Paz, the left, which was anyway distanced from parliamentary politics, may well have come through the elections in rather better shape than some pundits suggest. Bolivians' attachments to social and political liberties should not be underestimated and neither should their fierce support for the COB and the recently formed peasant unions be ignored in the face of the defeat of a specific current of confused reformism. The failure to provide an alternative to IMF policies and dullard deflation at whatever social cost will henceforth be judged less in its own terms than against the record of the new government, which is likely to adhere more strictly to these policies than its predecessor even if it desists from the hard line proposed by Banzer. We have already suggested that such a course might halt a further shift to the right, but it is equally possible that it might comprehensively discredit the ideas and apparatus of conservatism, be it veiled or bare-faced. Whatever the case, the coming period will surely be complex and daunting for a long-suffering nation.

after a leader of the great 1781 rebellion against the Spanish, is very distinct from *Sendero Luminoso* in Peru but no less antipathetic to the instructions of the 'white' Marxist left in the countryside, where it is likely to retain important influence even if this is not mirrored in the normal fashion of urban political forces. For a summary background to the growth of this movement, see Silvia Rivera Cusicanqui, *Oprimidos pero no Vencidos. Lucha del Campesinado Aymara y Qhwecha, 1900-1980*, La Paz: Hishol, 1985; Various, *La Fuerza Histórica del Campesinado*, La Paz: CERES, 1984; Josep Barnadas and Xavier Albó, *La Caza Campesina de Nuestro País*, La Paz: 1984.

Emigration and expulsion in the Third World

Throughout most of modern history, people generally moved from more developed to less developed lands. But for the last century, net migration has flowed in the reverse direction, toward the more industrialised areas of the globe. Discussion of emigration policies must focus increasingly, therefore, on Asia, Africa, and to some extent Latin America.

The right of individuals to leave their country, and conversely their right not to be forced to leave, are generally recognised today in international law and in such documents as the Universal Declaration of Human Rights and the International Covenant on Civil and Political Rights. This does not mean, of course, that nations committed to these rights in theory always respect them in practice. In the contemporary Third World, at least two patterns of assault on the right to leave or to remain are apparent.

One pattern is political and ethnic pressures, associated with the pains and tribulations of nation-building in new societies, that tend to produce refugees (in addition to those refugees driven by economic desperation, natural calamities, and other causes). The second pattern is an effort to block the loss of highly skilled emigrants to the developed countries, in combating what has been termed the 'reverse transfer of technology' or more commonly the 'brain drain'. In contrast to the first pattern, this issue is largely economic and developmental, and invites a reverse policy: forbidding, not forcing, departure.

These two impulses sometimes act simultaneously, as new nations are caught between the desire to be rid of those who don't fit in and the desire to make those with needed skills fit in. This explains much of the apparent inconsistency and vacillation of governments on both issues. The same states appear both as refugee-producers and as plaintiffs in the brain drain debate; it is not unknown for a state to lament the loss of

This article is based on research carried out in the framework of the project on contemporary emigration policies at The Twentieth Century Fund. The full study, tentatively entitled *The New Serfdom: Contemporary Control of Emigration and Expulsion*, is scheduled for publication under the Fund's auspices in late 1986.

badly needed professionals while deliberately creating the conditions that made them flee.

These patterns are reminiscent of the age of mercantilism and nation-building in Europe, especially in the desire to forge a new national identity. In both cases this led to tighter control of international movement, including both expulsion and denial of exit. In earlier times this was pursued in the name of religious conformity, while now it more often expresses a drive for ethnic or political homogeneity.

Nation-building and refugees

Let us focus first on the expulsion pattern, on the connection between nation-building and the drive for homogeneity. Surprisingly little analytical work has been done on the causes of contemporary refugee flows, despite their high incidence; they are often simply attributed to the fact of 'persecution'.¹ Some scholars, in particular Aristide Zolberg and Astri Suhrke, have begun to look more closely at these causes, using broad historical comparison to explain why some sources of turbulence produce refugees and others do not. Zolberg concludes that 'integration crises, which arise as a by-product of the secular transformation of a world of empires and of disparate small-scale communities into a world of states, have been the most important triggering mechanism of refugee flows throughout modern history.'² In his report to the UN Commission on Human Rights regarding the causes of massive exoduses, Prince Sadruddin Aga Khan also called attention to the 'integrative revolution' facing states with no tradition of statehood, and stressed the tendency to turn to authoritarian models in order to create cohesion.³

When ruling elites embark on an effort to strengthen national unity, they tend to turn on groups whose language, ethnicity, religion, culture,

¹ G J L Coles, 'The problem of mass expulsion', *Background Paper for Working Group of Experts on the Problem of Mass Expulsion*, convened by the International Institute of Humanitarian Law, San Remo, Italy, 16-18 April 1983, p 9, is one of many to comment on the astonishing lack of general studies on the causes of refugee flows, as opposed to the substantial literature on legal and humanitarian responses and descriptive case studies.

political beliefs, or socioeconomic status do not fit in. In early modern Europe this meant the expulsion of Jews and Muslims from Spain, the forced assimilation of French Huguenots, and imposed transfers of populations among European states in order to match the faith of subjects with rulers. This is not a matter of simple narrow-mindedness (though prejudice underlies it), but a drive for conformity that characterises certain phases of national consolidation. Marxists agree in attributing refugee flows to broad historical forces, which, in the contemporary Third World, they identify as injustice, exploitation, and economic weakness. They admit, however, that the 'progressive restructuring' of a society may also produce refugees.⁴

Whatever the particular homogeneity being pursued, it displaces those outside it. The process is not basically different today; what has changed is the scale of the dislocation. If the consolidating monarchies of Europe produced refugees in thousands or tens of thousands, flows now are measured in millions. Some of this is due to larger populations, the greater efficiency of modern warfare in uprooting civilians, and the 'pull' effect of refugee assistance programmes that did not exist in the past. But some of it is due to basic social and political conditions.

Early modern Europe, despite its divisions, had reasonably homogeneous core states. Most inhabitants of England or France shared a sense of being 'English' or 'French' in some meaningful way; there was a dominant cultural and linguistic model that gave the idea of an English or French state some reality, whatever deviant groups it might contain. But in many areas to which the idea of the nation-state was transposed, there was no sense of nation upon which the state could be built. The reality was a dizzying diversity. Africa as a whole, for example, has an estimated 800 ethnic groups and 1,000 distinct languages, and a typical African state might contain dozens of such groups.

In some cases, colonial policies accentuated these differences by playing groups off against each other in classic divide-and-rule style, and by introducing new groups through population transfers, such as Asians in East Africa. Colonialism also broadened existing splits and inequalities within societies, leaving a sharp division between Westernised and traditional elements. The borders drawn by colonial powers compounded the problem by paying little or no attention to demography or ethnography.

⁴ This was the phrase used by a Bulgarian representative on one of the UN bodies dealing with refugees (personal interview, 2 May 1984).

Finally, while the new nations may have inherited democratic ideals from the colonial powers, in practice they inherited essentially authoritarian government machinery. Many of the stronger measures used to forge national unity were, in fact, simply a continuation of methods used by colonial authorities, including expulsions. Ghana, for example, adopted in 1957 a Deportation Act based on British practice. When Uganda forced the Kabaka of Buganda from his throne in 1966, it was simply replaying his deportation by the British in 1953.⁵

At the same time, increased awareness of the huge inequality between 'North' and 'South' created greater pressures within the latter, fuelling expectations of progress that were doomed to be disappointed. In the rush to modernisation, diversity seems to impair economic efficiency: social conflicts and linguistic confusion complicate administration, block effective planning, limit the mobility of labour, and otherwise interfere with the realisation of the regime's cherished goals. As a leading African jurist said: 'Most progressive Africans would have no hesitation in subordinating the concept of free association to that of national unity.'⁶

In this charged atmosphere, some regimes are tempted to force population movements not only for internal reasons, but also as a weapon in their external relations. Many in Washington feel that Haiti uses the threat of illegal Haitian entrants to prompt more US aid. In 1971, India saw the flow of refugees from East Pakistan (now Bangladesh) as an effort by the Pakistani army to deter Indian intervention, and Thailand and Malaysia tend to see the flood of refugees from Vietnam as an attempt to destabilise their countries.⁷

In general, multinational or multireligious states have not been a conspicuous success in the post-World War II period, whether governed by democratic or authoritarian regimes. The conspicuous failures of Cyprus, Pakistan, Ethiopia, Nigeria, and Lebanon come to mind, as well as the continuing troubles in India, Sri Lanka, Iran, Iraq, Sudan, and a number of other African states. Nor are Western states free of such conflicts, as the cases of Ireland, Belgium, and Canada show. The dilemma is that attempts to mould a single national identity come precisely when the strength of separate identities is on the rise. No

multinational state seems to have resolved this tension completely, and the temptation to resort to coercion is powerful. As often as not, coercion means promoting assimilation by forcing and/or by blocking emigration.

Certain groups are particularly vulnerable to the homogenising pressures of militant regimes, and have produced most of the Third World refugees in recent years.

First are ethnic or religious minorities that have traditionally been targets of hostility within a society. Examples would include Bahais and other groups in post-1979 Iran, Kurds in Iran and Iraq, Tamils in Sri Lanka, Indians in Guatemala and Nicaragua, and a number of tribal groups in Africa (such as the Banyarwanda, expelled from Uganda in 1982). A particularly easy target in this respect are resident aliens (who may have lived in a country for decades or even generations); there have been a number of cases in Africa, most notably the Ugandan expulsion of Asians.

Ethnic groups associated with a rival are also a vulnerable target. Sometimes ethnic groups straddle borders, and sometimes pairs of states contain minorities associated with each other. In the early 1950s Jews were forced out of Arab lands, in 1971 Hindus were expelled from East Pakistan, and more recently ethnic Somalis fled from Ethiopia; pairs of states include India and Pakistan in 1947, Rwanda and Burundi in the 1970s, and the Turkish- and Greek-controlled sectors of Cyprus after 1974.

Other obvious targets include groups associated with former rulers and those considered to be political opponents. The whites who fled African states after independence, in Algeria, Angola, Mozambique, and Zimbabwe, are one case, while others include the Hmong in Laos (who cooperated with the American military) and, in certain respects, the Asians of East Africa. Political opponents are the classic 'asylum' cases: Chileans fleeing the Pinochet regime, Nicaraguans fleeing either Somoza or the Sandinistas, black activists in exile from South Africa.

A regime bent on radical restructuring may put pressure on an entire social class; the exodus from Castro's Cuba consisted in large part of Cuba's middle and upper class, and the Vietnamese explained the flight of their Chinese minority as a response to measures taken against the merchant class—which happened to be largely Chinese. Sometimes a regime makes war not just on minorities, but on the bulk of its own population. Cambodia under the Khmer Rouge, and Afghanistan since 1979, qualify for this distinction; in both cases the number of refugees is

a significant fraction of the total population. Most extreme was Equatorial Guinea under the infamous Macías regime in the late 1970s, where at one time an estimated half of the population sought refuge outside the country.

Clearly emigration from the Third World in our era has often been forced. In nearly all the cases cited, and many others, the flight of refugees was not just the 'unintended consequence' of events, but suited the purposes of the government. The immediate impetus may have been political or social upheaval, social discrimination, or economic deprivation that was not a direct government action, though the government may have been ultimately responsible. Some are cases of indirect coercion in which the government acquiesces in developments that leave little choice but flight. Behind this, often, were measures taken 'in the name of modernisation and progress', such as land appropriations or suppression of traditional folkways.⁸

Many of those forced out by indirect methods are not covered by the UN-recognised definition of refugee, which hinges on a 'well-founded fear of persecution'. Yet the element of duress is still there, and so is the need for humanitarian assistance. International agencies have therefore edged toward broader operational definitions; the Organisation of African Unity, in particular, has included external aggression, military occupation, foreign domination, and 'events seriously disturbing public order' as recognised sources of refugees. R K Jenny, for one, has suggested a far more realistic definition of refugees today, covering instances where 'a State acts, or fails to act, with the intention and the effect of enforcing or inducing the departure of persons against their will'.⁹

One expression of the changed character and scale of refugee flows is what Suhrke and Zolberg call 'refugee-warrior communities'.¹⁰ These communities depend on external aid to survive as a fighting group, typically in areas contiguous to their homeland, and the intrusion of international rivalries usually guarantees them a patron who finds their military activities useful to his own ends. They develop new exile leaders, adapted to the quasi-military style of life, who have a vested

interest in the perpetuation of the conflict and are typically opposed to any compromise that would 'liquidate' their grievances and their struggle. The archetypical case is the Palestinians, but others include the Afghans, Khmers fighting the Vietnamese-backed regime in Cambodia, the Nicaraguan contras, and Somalis on the Ethiopian border. The presence of such groups adds another problematic dimension to the problem of free international movement in our time.

Combating the brain drain

The second pattern of constraint on Third World emigration is a reaction to the threatened loss of skilled manpower. Concern over the loss of needed skills first surfaced around 1960, though at that time the concern was over the loss of European professionals and scientists to the United States. The theme was quickly picked up, however, by Third World nations, who complained that they were losing substantial numbers of their own skilled professionals. This amounted, they maintained, to a subsidy of those who least needed it by those who could least afford it. It was, in their words, a 'reverse transfer of technology'. By one estimate, the United States and Canada enjoyed a 'brain gain' during the 1961-72 period equivalent to \$46 billion, in terms of educational costs saved by importing already-trained experts and technicians.¹¹

A report by the United Nations Institute for Training and Research (UNITAR), in 1968, confirmed that there was, indeed, a large flow of skilled manpower from less developed to developed countries, that the rate of emigration was highest at the higher levels of skill (especially among engineers, medical personnel, and scientists), and that the flow was increasing and could be expected to continue increasing (except perhaps from South America).¹² Another UNITAR study, the Henderson report of 1970, put specific percentages on some of the losses. Colombia, by this account, lost 27 per cent of its highly qualified professionals in the 1964-9 period, while Greece lost 35 per cent of its engineers, 27 per cent of its scientists, and 25 per cent of its doctors in just four years (1961-5). Ten per cent of all Indian doctors were working in Britain or the United States. According to a 1977 report for the United Nations Conference on Trade and Development (UNCTAD),

¹² *Outflow of Trained Personnel from Developing Countries*, Report of the Secretary-General, New York: UNITAR, 1968, p. 5.

Pakistan lost 50–75 per cent of its medical school graduates each year.¹³

Nineteen eighty-four estimates of total accumulated loss of professional manpower from the Third World range from around 400,000 to 500,000.¹⁴ But numbers do not convey the full story: Sudan lost only 1 per cent of its labour force to emigration, but this included 70 per cent of its medical graduates and such high percentages of high-level clerical personnel as to become 'an obstacle to the efficient working of government.'¹⁵

The Prime Minister of Jamaica, Edward Seaga, told the Governing Council of the United Nations Development Programme (UNDP) in mid-1984 that in the years 1977–80 alone Jamaica had lost about 60 per cent of its professional graduates to North America, representing a loss of about \$194 million in educational costs. He concluded pessimistically that such losses would continue, since 'countries which have open societies cannot restrain this movement without violating essential human rights, and at the same time cannot compete with the financial and other advantages offered by the industrialised countries.'¹⁶

Despite all this, the attention paid to the brain drain declined during the 1970s, whether due to verbal saturation, frustration over lack of action, or the sheer intractability of the problem. There had been a seemingly endless parade of studies, over twenty by UNCTAD alone up to 1984. The fact that there were still calls for more data, after almost twenty years of studies, indicated some of the complexity in defining and measuring such an intangible commodity as brainpower.

In addition, a growing number of resolutions had been passed by the General Assembly, UNCTAD, and other UN organs. In general, these resolutions called on developed countries to encourage foreign students and professional workers to return to their native lands, advised less developed countries to indigenise their education and provide more professional opportunities and recommended that everyone study the problem more carefully. Some of these admonitions urged that

This report from a meeting of governmental experts gives a figure of over 400,000; a later UNCTAD report (TD/B/10/18, 17 September 1984) estimates 500,000.

¹⁵ Newland, *op cit*, p 11.

¹⁶ Edward Seaga, 'Towards an international fund for manpower resources', address to the Governing Council of the United Nations Development Programme, 12 June 1984.

international migration flows be more carefully 'organised', and that the consent of governments be sought for substantial flows, but none of the UN documents made any direct call for restrictions on the right of people to leave their country. It was obviously difficult to find countermeasures that were acceptable to all sides and consistent with basic human rights.

But sooner or later claims of national development were bound to clash with freedom of movement. Third World spokesmen, from the 1960s began to express theoretical reservations to unrestricted emigration. Gregory Henderson, in his 1970 UNITAR report, warned that 'in a world of stark wealth-poverty, there are legitimate doubts as to whether complete freedom of movement is, in fact, compatible with the maximum development of developing countries.'¹⁷ In the debate over the interests of society versus the rights of the individual, these nations began with a 'tilt' toward society, toward what they called 'economic and social rights' as opposed to the political and civil rights of the individual. This frame of mind was captured admirably in 1973 by an Egyptian diplomat, Hussein A Hassouna, in a legal debate over the right to leave:

The right to leave a country is certainly an important right but the importance attached to it is by no means universal . . . whereas in Western opinion the right to leave should be absolute and unqualified, most developing countries see it subject to limitations and qualifications. Indeed, to open the door for unrestricted emigration would run counter to the vital interests of any developing society.¹⁸

Given the tensions with development concerns, then, the right to leave has not been among the rights Third World spokesmen have championed or given high priority. Generally they have not attacked the legitimacy of the right to leave, but they have not called attention to it either. It is not part of their agenda or prominent in the consensual perspective shared by most Asian and African spokesmen. As an international civil servant from India put it, 'we are not going to stop it, but we are not going to champion it either.'¹⁹

In a few cases, the temptation to use 'direct measures' to stem the flow of a country's scarce professionals has prevailed. In Mozambique,

¹⁹ Personal interview with Rustam Lalkaka, Deputy Director, United Nations Interim Fund for Science and Technology for Development, 9 April 1984.

for example, the announced policy is to 'discourage' emigration, and an applicant for an exit visa must justify his case; he is not allowed 'just to emigrate.' *Given the need for skilled people, it is argued, the right to leave 'must be implemented in accord with the situation in the country.'*²⁰ Other African states, less restrictive, may still use 'administrative measures' to retain particular individuals, on grounds of their responsibility to serve the nation. The fact that many or most professionals work in the public sector gives governments more control in such cases.

A 1983 UNCTAD survey recorded five types of restrictive measures used by states to plug their brain drains. The most direct was control of passports and exit permits, to which only a handful of countries would admit. Service bonding, or acceptance of an obligation to work at home in return for support in study abroad, was employed by a few. Some countries discouraged study or work abroad by tight controls on foreign exchange, travel taxes, or required deposits for return passage. Others required that a given percentage of foreign earnings be sent back home, though the motive was more often to earn foreign exchange than to curb emigration. Finally, there were measures directed specifically at professions where the drain was greatest.²¹

One of the more instructive efforts to restrict professional emigration directly was made by Pakistan in early 1976. In January of that year the government announced an Emigration Ordinance that required thirteen categories of skilled personnel to obtain 'no objection certificates' from the relevant ministry before leaving the country, and made them liable to a 'capitation fee' of up to 20 per cent of income earned abroad. A storm of protest ensued, forcing the government to withdraw the legislation ten days later, except for the requirement of 'no objection certificates' for doctors (required since 1973) and public employees. Even this was ineffective, as government employees could always resign their jobs, and, as noted, large numbers of doctors managed to leave the country in any case.²²

Regarding profession-specific measures, the loss of medical

²² Naseem, *op. cit.*, pp 19-20.

personnel in particular has evoked drastic responses over the years. Haiti at one point completely forbade the departure of doctors, dentists, nurses, and laboratory technicians. Thailand and Ethiopia adopted compulsory periods of service for medical graduates, and other countries have sometimes required that those applying to study medicine abroad post bonds guaranteeing their return. The authors of a World Health Organization (WHO) study on physician migration note that 'the countries concerned . . . claim that, in order to reconcile the rights of society with the rights of the individual, some personal freedoms may need to be restricted'.²³

This emphasis on community rights has enabled Eastern bloc nations to use the brain drain issue effectively. Brain drain concerns seem to illustrate the justice of controlled emigration, and help to justify Eastern bloc policies in terms understandable to the Third World. It is also a good issue for strengthening cooperation between the two blocs, in common cause against Western 'exploitation'. The Soviet bloc has therefore incorporated the brain drain rhetoric into its own verbal arsenal, making a case for direct controls that Third World spokesmen seldom make for themselves.

An illuminating statement of the Eastern bloc viewpoint has been made by Péter Vas-Zoltán, a Hungarian economist. Vas-Zoltán begins by shifting the ground from the individual to the collectivity, stressing Article 29(1) of the Universal Declaration of Human Rights: 'Everyone has duties to the community in which alone the free and full development of his personality is possible.' The community has the duty, Vas-Zoltán continues, to provide professional training at state expense in the socialist nations and 'the human capital created in this way becomes part of the nation's wealth in the broadest sense of the term.' The state has, therefore, the implied right to prevent loss of this capital, if necessary by 'administrative' measures.²⁴

Such measures may also be a necessary defence against the active recruitment of professionals by Western interests, Vas-Zoltán argues. The US economy, he asserts, could not keep going without the influx of professionals trained at Third World expense; therefore, it actively organises the process (immigration laws favouring professionals are cited as evidence). This is in his estimation a symptom of the unequal

²⁴ Péter Vas-Zoltán, *The Brain Drain. An Anomaly of International Relations*, Leyden: A W Sijthoff; Budapest: Akadémiai Kiadó, 1976, pp 24, 25, 27.

power relations in the world system, an expression of the 'objective laws' governing social systems at different stages of development.²⁵

Though Vas-Zoltán does not directly urge Third World countries to adopt Eastern bloc practices on emigration, he lays the basis for their doing so (defending, for example, the measures taken by East Germany in Berlin). He provides them with a justification for drastic action that few of them have sought or claimed for themselves, since relatively few Third World nations have tried to deal with the brain drain by choking off emigration directly.

Why do Third World governments hesitate to press for such an obvious answer to such an ominous threat? Why, for example, do none of the UN resolutions on brain drain, over which they have great influence if not control, even hint at such measures? One plain reason is that where they have been tried, 'direct measures' simply have not worked. The 1983 UNCTAD study, after surveying such methods, concluded that they were universally ineffective. A 'Berlin wall for brains' will not solve the problem. Even Vas-Zoltán admits that 'it has been proved in practice for decades now that brain drain cannot be stopped by administrative measures (eg. by travel or visa restrictions)'. Typical of UN statements is a 1970 Report of the Secretary-General:

In view of the nature of the forces at work stimulating the outflow, it would seem advisable for both developed and developing countries to concentrate on development goals and to minimise migration controls as the basic strategy for keeping more of the ablest and most needed specialists at home.²⁶

Why should this be the case? In the first place, Third World countries, like all countries until recently, exercise somewhat imperfect control over their own borders. As another study put it, 'If an individual feels strongly that emigration is his best course, it is doubtful that passport control will stop him from migrating.'²⁷ Moreover, the highly skilled are precisely the most difficult segment of the population to contain. Many are already abroad, as students (up to half of the brain drainees in the US, for example, simply stayed on after their studies). As a group, professionals are the most familiar with international travel and the

²⁷ Robert G Myers, *Education and Emigration: Study Abroad and the Migration of Human Resources*, New York: David McKay, 1972, p 334.

most resourceful in evading restrictions on it. They are, by and large, a part of the local elite—often the children of the elite—and as a privileged segment of society, can circumvent restrictions that are imperfectly conceived, imperfectly formulated, and imperfectly implemented. They also have a genuine need for mobility; a developing country that seals its professionals off from training and contacts abroad only handicaps itself.

According to the evidence, Third World regimes that have tried the restrictive approach have not had their heart in it. They seem to realise that such measures, to be effective, would have to be much more drastic. Partial measures may only increase the urge to leave while it is possible; both India and Pakistan found that measures to keep doctors at home only increased the pressure to leave, in apprehension of even worse measures. The WHO study of physician migration noted that penalties on illegal departure have the counter-productive effect of discouraging an eventual return.²⁸ In short, effective immobilisation of a country's talent would require something like a police state; to their credit, most Third World governments do not want to take this route, and those that do tinker with restrictive measures seem to do so without much will or enthusiasm.

Sri Lanka is another country that tried the restrictive approach and found it wanting. In 1961 it adopted a Compulsory Public Service Act, requiring all professional graduates to serve five years in public service. This was followed by a passport law in 1971 requiring remittances from professionals abroad, and in 1972 by a system of service bonds requiring one year's public service for each month of state-supported study abroad. By 1974, however, a Cabinet Committee was forced to conclude that 'the heavy hand of the State' had not been effective in discouraging emigration, and these measures were relaxed. Subsequently stress was put on creating better opportunities, and Sri Lanka became one of the more successful exemplars of positive programmes as a response to the brain drain.²⁹

Finally, many of the countries that lose professionals—Pakistan for example—are at the same time encouraging the outflow of labour migration on other levels, and this impinges on any anti-emigration policy. They do not call on the Western world to tighten its immigration

²⁸ UNCTAD, *Consideration of Recommendations . . . op. cit.*, Mehta et al., *op. cit.*, p. 472.

²⁹ United Nations Conference on Trade and Development, *Case Studies in Reverse Transfer of Technology (Brain Drain): A Survey of Problems and Policies in Sri Lanka*, TD/B/C.6/AC.4/4, 19 December 1977, pp. 11–17.

laws, which would be one way of keeping brains at home. To the contrary, they often denounce the tight restrictions of Western immigration policy. They also hesitate to interfere with the right to leave, even if they could find a practical way to exclude the most talented from those allowed to depart.

But what of the ominous statistics, cited above, on the brain drain? Is it not possible that the loss of top-level experts could be a real problem, even if the emigration of others is not? Looking more closely at the claimed costs of the brain drain, one notices first that these costs are simply assumed. The statistics only tell us the numbers of professionals who have emigrated; there are no statistics, and no agreed means of measuring, the actual damage done to a state's economy and society. Henderson, in his landmark study, concludes that 'it is not possible to assess with confidence the loss (or profit) that the present migration of professionals inflicts on developing countries.'³⁰

We do, however, know something about the patterns of professional emigration and the motivations of the 'drainees', based on the numerous studies carried out. These studies, and in particular a large multinational survey in the 1970s coordinated by UNITAR, put the brain drain issue in a revealing perspective.

In the first place, the phenomenon varies considerably among countries. Actually, European nations still lose more of their students and professionals than do most developing countries; during the 1960s, Britain was regularly losing from 20 to 40 per cent of its graduating engineers and scientists every year, mostly to North America.³¹ Among developing countries, according to the UNITAR study, the percentage of students abroad who plan to return home varies enormously (98 per cent for Ghanaians; 30 per cent for Egyptians). The bulk of Third World emigrant professionals come from a few nations: India, the Philippines, Iran, Korea, Pakistan, Egypt, Greece, and Turkey (in Latin America, the principal losers are the Caribbean nations, Colombia, and Argentina).³² What most of these countries have in common is a large population base and a relatively advanced educational system, especially in relation to the professional opportunities available.

Contrary to common belief, it is not the least developed countries that suffer the most from the brain drain, nor does faster economic growth in

³⁰ Henderson, *op. cit.*, p 116.

³¹ Gaughin, *op. cit.*

³² William A Glaser, *The Brain Drain: Emigration and Return*, UNITAR, Oxford: Pergamon Press, 1978, pp 24-8; see also Henderson, *op. cit.*, pp 53-4

itself seem to reduce it. In reality, the least developed countries have less trouble getting professionals back, because there is less competition for available openings and because adjustment to life in North America or Europe is more difficult. Countries at a higher level of development seem to have more trouble, apparently because of imbalances between education and opportunities available.³³

Next, any analysis of the brain drain must subtract the political component of professional emigration. A surprising percentage of the 'drainees' are actually members of minority groups who have been made to feel uncomfortable or unwanted (by language legislation and other 'homogenising' policies), or are at odds with the regime politically. Sometimes intellectuals as a group are seen as a threat and harassed. Many African experts assert that the loss of skilled people on their own continent is due more to political than economic causes.³⁴

The case of Uganda in particular stands out; over the years the expulsion or persecution of Asians, of certain tribal and political leaderships, and of intellectuals generally, has deprived that country of a fair part of its professional class. The treatment of Chinese in Vietnam, Indonesia and Malaysia also comes to mind. The impressive outflow from Jamaica in the late 1970s, noted by Prime Minister Seaga in his speech cited above, was in large part due to the international instability and economic crisis that brought him to power in the 1980 elections. The most intensive and systematic brain drain in the world, in all likelihood, has been in Haiti, which may have lost 60–75 per cent of its high-level manpower since 1950—almost entirely as a result of the policies and activities of its government, which may qualify as the hemisphere's worst man-made disaster.

After allowing for non-economic causes of professional emigration, the decisive motivation appears to be one of working conditions and employment. Level of income is less decisive, apparently, than satisfactory employment in one's area of training. Thus much of the outflow is an overflow: 'A crucial criterion is the balance between the education of professional persons and employment opportunities.'³⁵ In other words, *the main motivation for the remaining emigration is the lack of suitable jobs*. There are some cases where jobs go unfilled, but in most

³³ Glaser, *op. cit.*, pp 29–33.

³⁴ Based on personal interviews with several African representatives, including a former cabinet minister now serving as an expert on refugee affairs for a UN body, see also Glaser, *op. cit.*, pp 39–46.

³⁵ Glaser, *op. cit.*, p xxxix; see also pp 33–6, 92, 115, 120–4, 126–8

cases, there is simply no employment fitting the drainee's training and qualifications. In the words of the Henderson report:

The chief general cause of brain drain appears to be the lack within developing nations of effective *demand* for professionals despite the presence of almost unlimited *need* . . . In fact, though manpower shortages are often quite acute, the ability of most developing countries to absorb specific high-level skills is limited; often the actual numbers required are relatively small and a small rise in supply may quickly reverse a need recently acute.³⁶

If this is the case, it is not the availability of more tempting options in the developed world that is at the core of the problem, nor would restricting access to these options solve it. It is not even a 'drain' in a real sense, since a professional who remained at home would probably not find employment making use of his skills, and his presence would not speed development. Thus countries with the greatest outflow of professionals are not necessarily 'hurting' more, as they are in no position to use the lost skills anyway.

These facts help explain an observable oddity about the relationship between brain drain and emigration policy in the Third World: *those states that have suffered the greatest loss of professional manpower have by and large not tried to restrict movement, while those with restrictive attitudes often admit that the brain drain is not a real threat to them.* It also helps explain the lack of concern about the brain drain noted by many observers. A few years ago, the UN Economic and Social Council asked member states to comment on proposals regarding brain drain; only nine developing nations replied. When the US Department of State surveyed US missions in seventy-six nations on the return of students from the United States, only sixteen replied that the local government felt it was a problem. The truth is that 'comparatively few developing states have, up to now, felt strongly that action should be taken.'³⁷

Elites in Third World countries do not want to give up education abroad, of which they and their families are the chief beneficiaries. They also know that they benefit from the talents of individuals whose training has been paid for elsewhere; there are counterflows that often offset the presumed losses. Within regions particularly, the diffusion of skills and building of cohesion, through the movement of skilled personnel, has sometimes been remarkable (the Arab Middle East being a case in point). Third World leaders are not unaware of the

³⁶ Henderson, *op. cit.*, pp 39, 125.

³⁷ *ibid.*, p 119.

classic benefits of human movement, nor have those benefits ceased to be relevant in the context of underdevelopment.

It is doubtful, in short, that more discerning Third World leaders have any real interest in direct controls on emigration, even if such controls could be made effective. There are, after all, many powerful forces pulling emigrants back to their homelands, and if the absence of suitable employment was the main reason for departure, the nature of the solution seems clear. The WHO study of physician migration concludes on this point: 'When a country reaches the point where it can afford its expatriates, most are likely to return of their own accord, given that ties with family, culture, and homeland are not easily broken.' The study also concludes, with unassailable logic, that a country should either produce no more physicians than it can employ, or should create jobs to employ those produced.³⁸

The most effective measures, in short, will be positive rather than negative. Nations affected by the brain drain can begin by eliminating the political conditions—persecution, pressure to assimilate, harassment of intellectuals—that contribute to it. Among other positive measures, perhaps the most crucial is the development of local higher education and its coordination with the availability of employment. This may involve the 'indigenisation' of professional training, replacing Western educational styles with native modes more closely attuned to local needs and expectations. There are a number of other constructive ideas in circulation, among which are:

- (1) Programmes for cooperative exchange of skills among developing states, as promoted in UNCTAD.
- (2) The 'return of talent' programme of the Intergovernmental Committee on Migration, which seeks placement of expatriates in their homelands or the region of their homelands.³⁹
- (3) The transfer of knowledge through expatriate nationals (TOKTEN) programme, in the framework of the UN Development Programme, which has brought over 1,000 expatriates back to their countries as visiting consultants.

³⁸ Mejia *et al.*, *op. cit.*, 415–16, 422. On the intention of most students to return to their homeland, even after extended employment abroad, see Glaser, *op. cit.*, pp 14–19, 22–3.

³⁹ James L. Carlin, 'New international initiatives in responding to refugees', in Lydio Tomasi (ed), *Immigration and Refugee Policy*, Vol 6 in *In Defence of the Alien*, New York: Centre for Migration Studies, 1984, p 150.

(4) The proposal of Prime Minister Edward Seaga of Jamaica for an international fund for manpower resources that would finance the recruitment of skilled manpower in Third World countries.

There are, therefore, constructive avenues that states can explore in order to defend their interests. Moreover, examined closely, the brain drain takes on less frightening proportions, and appears to have little conflict in practice with the right to leave one's country. Why, then, has the issue created such a stir?

On the part of the Third World, the issue may be important because of its linkage to North-South tensions. The 'drained' countries are not interested so much in imposing restrictions on themselves, as in gaining recognition of the responsibility of the industrialised nations to the less developed. The 'brain drain' is one index of their inability to compete with the North, and an important symbol of the gains which Northern states make at their expense.

The greater interest of Third World governments, therefore, is in some form of compensation for losses incurred. A number of ideas along these lines have been proposed and promoted. The problems with such proposals are easy to imagine. In the first place, developed states question whether there is a 'real loss'—on the grounds discussed above—and have not demonstrated an acute interest in being charged for the services of voluntary immigrants. Then there is the problem of calculating the value of something as intangible as 'brains': should this be measured by the cost of a person's education, the cost of replacing his services, the worth of his future earnings, or some combination of these? Finally, there seems to be something crass, if not dehumanising, in regarding human beings as a commodity whose value is to be negotiated among states. Most observers feel that the idea of compensation will go nowhere; Third World governments would probably be better advised to focus on the type of positive measures illustrated above.

If the brain drain issue is important to Third World nations for its North-South connotations, what of the interest of the Eastern bloc? As indicated already, the issue is ready-made for building anti-Western sentiments. Also, the brain drain litany is the best weapon that closed countries have in attacking the concept of free international movement. By identifying the 'stealing of talents' with neocolonialism and the exploitation of the Third World by the First World, it is possible to delegitimise the right of emigration. A key indication of this is that these arguments, presumably made on behalf of the Third World, go beyond

what the Third World claims for itself. One might well regard such solicitude with a measure of scepticism.

Emigration and expulsion in the Third World

The cases of denied exit in the Third World are not nearly as widespread nor as dramatic as the expulsions. The two phenomena are closely interrelated, however, and not only because the same states are involved in both cases. In states that refuse permission to leave, those who manage to leave anyway automatically become 'refugees', and in other cases people flee 'pre-emptively' because they anticipate being locked in by a new regime or a new policy. These patterns become clear in a review of controlled international movement, of exclusion and constraint, as it has evolved in Asia, Africa, and Latin America.

In Asia there is a strong tradition of governmental authority, and emigration has been regarded more as a privilege than as a right. Even where there is little interference in practice, the government theoretically retains discretion over permits to leave (as in, for example, Malaysia, the Philippines, Singapore, Thailand, and Pakistan). The only clear-cut guarantors of the right, where permissible exemptions are written into the law and are subject to judicial review, have been Japan, Australia, and, to some extent, India.⁴⁰

As Communist regimes were established or consolidated in Asia (China and North Korea in 1949; Vietnam, Laos, and Cambodia in 1975; Afghanistan in 1979), they almost uniformly eliminated free emigration. The same states also produced a large share of the area's refugees. Chinese consolidation of control in Tibet led to the flight of the Dalai Lama and about 85,000 other Tibetans in 1959.⁴¹ In addition, a steady stream of Chinese refugees reached Hong Kong. Following the 1954 cease-fire in Indochina, which temporarily partitioned Vietnam, a large number of 'pre-emptive' refugees—mainly Catholics—moved from the Communist-controlled North to the South. The 1975

⁴⁰ David Marshall, 'The Far East', in Karel Vasak and Sidney Liskofsky (eds), *The Right to Leave and to Return*, New York: American Jewish Committee, 1976, pp 345-411, and Niall MacDermot, 'India, Sri Lanka, Pakistan, Bangladesh and Afghanistan', in *ibid.*, pp 413-30. The Vasak and Liskofsky volume is a collection of the papers given at the Uppsala symposium, in 1973, and is a principal source for other states during this period as well. On India, see also M P Chandra Kantaraj Urs, 'Right to Freedom of Movement Outside One's Country', in International Commission of Jurists, Indian Commission of Jurists, and Mysore State Commission of Jurists, *International Year of Human Rights: Report and Conclusions of the Conference of Jurists on Right to Freedom of Movement*, Bangalore, 1968, pp 25-51.

⁴¹ Holborn, *op. cit.*, pp 715-17.

consolidation of Communist regimes in Indochina produced a large outflow over the next few years.

In the early 1970s, several other Asian states also restricted emigration closely, if not quite as tightly. Under the revolutionary government in Burma, it was very difficult to get a passport. Permission to leave Indonesia or Taiwan could be denied for political reasons, and at one time getting out of Sri Lanka was described as 'practically impossible'.⁴² Many of these nations also had induced refugee flows, usually on an ethnic basis: Indians, Arakanese Muslims, Malays, and Karens from Burma; Chinese (and more recently Papuans) from Indonesia; Tamils from Sri Lanka.

There were also a large number of refugees on the Indian subcontinent, along ethnic-religious grounds. With the partitioning of India in 1947, an estimated 8.5 million Hindus and Sikhs moved from Pakistan, while some 6.5 Moslems fled from India.⁴³ The Pakistani campaign in East Pakistan (Bangladesh) in 1971, as already noted, produced a huge flow of both Bengalis and Hindus into India (a number estimated at about ten million).

Throughout the area, the element of coercion in both denying and forcing emigration was high. Most refugee flows seem to have a high degree of compulsion behind them. There was also a high association between the two forms of coercion; constraint on free emigration went hand in hand, in most cases, with the generation of refugees.

In the Middle East, despite a tradition of authoritarian government, there has generally been less restriction on movement. This may be due in part to the unifying influence of Islam, and in more recent times to the sense of a common Arab nationality across existing borders. In more traditional patriarchal regimes—Saudi Arabia in particular—women may not leave the country without the consent of the husband or father. But by and large, restrictive trends had limited impact in the area.

The major exceptions are the radicalised regimes: Syria, South Yemen, Iraq after 1958, Libya after 1969, Iran after 1979. Some of these states—Iraq, Syria—have constitutional guarantees of the right to leave, but these are of limited relevance. The same states account for many of the deliberate expulsions in the area: Iraq expelled Iranians in 1969 and Kurds in 1974 and at other times; Iran has vacillated between forcing

⁴² MacDermot, *op. cit.*, pp 413–30.

⁴³ Gunther Beijer, 'The political refugee: 35 years later', *International Migration Review* 15(1–2) Spring–Summer 1981, p 29.

out Bahais and other minorities, and forcing them to stay; Libya expelled all Egyptians and Tunisians in 1976.

Some Middle Eastern states provide for denial of permission to leave on security grounds, and exercise this power in some individual cases. This would include Egypt, Israel, Jordan, and Lebanon.⁴⁴ Algeria, in 1973, suspended all new emigration to France in reaction to racist incidents there involving Algerian workers, despite the fact that the Algerian economy had become dependent to some degree on the export of labour.⁴⁵

The largest body of refugees in the area are the Palestinians, estimated at 600,000 to 700,000 in 1948 and now increased to about two million, according to UN figures.⁴⁶ Following the 1948-9 war, a similar number of Jewish refugees from Arab countries came to Israel, most of them as involuntary emigrants. While Arab states sometimes forbid Jews to leave, this alternated with de facto coerced exit.⁴⁷

On the whole, however, the Middle East had a lower level of coercion in emigration policies than Asia, and most of it was accounted for by a handful of radicalised regimes. There was also a lower level of forced expulsion; many refugees were a byproduct of war more than deliberate policy. But, in the latter case, it was often the same regimes that were responsible.

In Africa, there was also traditionally much free movement; many groups lived a semi-nomadic existence, and precisely defined state borders were a nineteenth-century European imposition. Many African states upon independence guaranteed the right of emigration constitutionally, but this has sometimes been undermined by assumption of discretionary authority either in theory or in practice.⁴⁸

Tight restriction of the right to leave has spread to only a few African countries: Somalia since the 1969 Barre takeover; Ethiopia since the

⁴⁸ For the general picture, see G Lukongwa Binaisa, 'English-speaking Africa', pp 431-7 in Vasak and Liskofsky, *op. cit.*; and Ousmane Goundiam, 'Pays africains autre qu'anglophones' pp 439-72 in Vasak and Liskofsky, *op. cit.*

1974 deposition of Haile Selassie; Mozambique and Angola since independence in 1975. Again, these represent the most heavily ideologised states in sub-Saharan Africa, and the same states account for a good share of the continent's refugees. In Ethiopia, Eritreans and Somalis have fled in the midst of a civil war, and the degree of coercion is debated. Angola and Mozambique both underwent a significant 'white flight' after independence, and many others have fled Angola in the course of protracted civil war, while there has been significant movement of certain groups out of Mozambique into neighbouring countries.⁴⁹

Africa has produced many refugees, but the circumstances have varied considerably. The clearest cases of direct expulsion were in Uganda, with the Asians in 1972 and certain tribal groups since. In late 1982, for example, the youth wing of the Ugandan Peoples' Congress, with the support of local officials, drove about 80,000 Banyarwanda out of the country (the Ugandan government later claimed it did not approve).⁵⁰ Less clearly a result of deliberate policy, but still related to assimilationist pressures, has been the flight of black Africans from southern Sudan during the Arab-dominated government's sporadic efforts to integrate the area more fully (most recently, by applying Islamic law).

There was a wave of expulsion of aliens in 1967-72, by Ghana (expelling mainly Nigerians), Sierra Leone (Ghanaians), Equatorial Guinea (Nigerians), Niger (Dahomeans), Uganda (Kenyans and others), and Zaire (from various countries). In 1978 Gabon expelled Benin nationals in retaliation for a Béninois condemnation of Gabon at an OAU meeting. In early 1983 Nigeria suddenly expelled about two million aliens, about half of them from Ghana, in response to economic difficulties and panic over the growing number of foreign workers, and in May 1985, it again gave about 700,000 aliens a week to leave the country.⁵¹

There were a number of other coerced movements that are best explained on a tribal basis. Some groups, under duress of one kind or another, crossed borders to find refuge with their own kin; this occurred in Guinea-Bissau, Ghana, Burundi (the Hutu fleeing from the Tutsi)

North-South Monitor

reform of management systems and institutions; and the curbing of public spending. A phrase identifying the roots of Africa's problems in its colonial past was hotly disputed and delayed the programme's adoption in the last session. Both the Soviet Union and the original drafters of the OAU-ECA document subscribed to the existing wording. The phrase was eventually diluted, however, to lay the blame for Africa's current problems partly on the colonial legacy and partly on the post-independence era.

The General Assembly was charged with reviewing and appraising the programme's implementation in 1988, while the UN Secretary-General would monitor progress in the intervening period, reporting to the UNGA in 1987, and meanwhile coordinating the assistance of the various UN agencies.¹⁵

● 'What we are seeking is a mutual commitment to a more productive future for Africa. Africa must commit itself to squarely facing its own problems and making the necessary difficult decisions and the world community must resolve that it will assist what is by far the world's poorest continent. The . . . target is not a catalogue of projects needing funding . . . We have to go beyond projects to the basic questions of attitudes, of priorities, of economic and social policy.' Edgard Pisani, Chairman of the Preparatory Committee of the Special Session, speaking of the session's goals. *Development Forum* April 1986.

'We have put our case before the international community, and we have put it squarely. We ourselves are determined to play our role and to pull ourselves up with our own bootstraps as it were, in keeping with the imperative of self-help and collective self-reliance.' Bernard Chidzero, Finance Minister of Zimbabwe. *International Herald Tribune* (Paris) 30 May 1986.

'The United States, with its own budgetary concerns, cannot meet all the African requests for assistance. So we are exploring creative alternatives mostly through multilateral institutions.' George Shultz, US Secretary of State. *The Guardian* (London) 29 May 1986.

▲ Conference on Sanctions against Racist South Africa Paris, 16-20 June 1986

■ Over 120 countries took part in the conference, which was organised by the UN Special Committee on Apartheid, in cooperation with the Organisation for African Unity (OAU) and the Non-Aligned Movement (NAM). Taking place on the tenth anniversary of the Soweto uprising, and four days after the declaration of a state of emergency in South Africa, its brief was to review developments since the last such conference in Paris in 1981, and to propose measures aimed at ending apartheid and South Africa's interference in its neighbouring states. While seven countries including France and Japan attended the conference as observers, the US, Britain and West Germany, South Africa's main trading partners, were conspicuously absent.

A succession of speakers advocated the application of global and mandatory sanctions against South Africa, criticising the absent industrialised countries for lacking the political will to implement adequate measures against Pretoria. President

the Sandinistas, has stopped opposition leaders from travelling abroad, and requires government officials and doctors to receive special permission to leave. The Stroessner government of Paraguay, and Haiti under the Duvaliers, have also been known to refuse passports on political grounds. The Haitian government has generally regarded emigration as a business rather than as a means of relieving the nation's population pressures, extracting up to \$1,500 for an exit permit and taking a cut of remittances sent back from abroad; it is also used as a means of sterilising the country of any effective opposition to the government.⁵⁴

Apart from the last two, this corresponds closely to the radicalised states in the hemisphere, and as elsewhere these states also account for a good proportion of the refugees. Apart from Cuba, there are now about 23,000 Nicaraguan refugees, according to the US Committee on Refugees (under the Somozas there were about 100,000, most of whom returned to Nicaragua after the Sandinista victory).⁵⁵

Other refugees in the hemisphere have included the opponents of the Pinochet regime in Chile (permitted to leave after the 1973 coup under a programme organised by the Intergovernmental Committee on Migration), Indians forced out of Guatemala by the army's 'pacification' programme there, and those fleeing from El Salvador and Haiti. The latter are regarded as economic migrants rather than refugees by the US government, since recognition as refugees would tend to discredit American support for the El Salvador and Haitian governments (as well as increasing refugee admissions to the United States). The weight of evidence would seem to be, however, that most of those fleeing, if not the victims of a deliberate policy, are at least leaving for political reasons, basically because they are members of groups that have been the targets of violence (El Salvador) or are victims of a 'kleptocracy' in which economics and politics are intertwined (Haiti).⁵⁶

Despite generally unrestricted and uncoerced movement, therefore, there are some controls associated with traditional methods of suppressing opposition, and some associated with the more ideological

regimes. In Latin America, even more than elsewhere, the claims of development have not been an important factor in controlling international movement.

Ideology or developmental pressures?

The most restrictive emigration policies in the Third World appear under regimes that define themselves as Marxist-Leninist. There is also a 'developmental' model of control of movement, to which some states appear to belong and which also produced refugees in some cases. But the dramatic instances of coerced or denied emigration come where radical ideologies of state control are superimposed on developmental problems, especially in states suffering unusual handicaps in internal unity or external opposition.

Afghanistan and Ethiopia are both still in the stage of basic integration as a society. This helps to explain the unusual turmoil, and the resort to extreme measures. As Suhrke and Zolberg remark regarding Ethiopia, 'It was as if the French Revolution had been initiated by Napoleon, and in the fifteenth century rather than the eighteenth.'⁵⁷ These cases accounted for the most massive displacement, and for attempts (ineffective as they might be) to seal borders as tightly as Marxist-Leninist regimes elsewhere have done.

In Vietnam, different kinds of special pressures operated: the long and costly struggle, the difficult task of reconstruction, the presence of the Chinese threat. Cuba also faced the enmity of a powerful state in close proximity.

Developmental pressures, and especially the brain drain, make life more difficult, but by themselves provide no clear justification for abridging individual rights to free movement. Nor does development necessitate the production of refugees. Numerous cases, on both counts, show that development can take place successfully even with large professional emigration, and without purging a population of the nonconforming.

The thinking behind coercive emigration policies in the Third World is not essentially different from the key to the same dynamic elsewhere. It is an ideological frame of mind that reduces human beings to objects of state policy and regards their movement as matters of convenience to the state. The cases examined here also show the interplay between

⁵⁷ Suhrke and Zolberg, *op. cit.*, p 27

expulsion and constraint of movement, with one seeming to necessitate the other. There is a thin line between the two forms of coercion when rulers are committed to rigid and detailed blueprints for remoulding society.

Counter-trade as a Third World strategy of development

Economic relations between Third World and industrialised nations are in the process of fundamental alteration. The structure of trade, the international division of labour, global comparative advantage, access to markets and strategic raw materials, the transfer of technology, and industrial location as well as the 'management' of the global economic system are currently realigning to reflect international economic and political reality. This shift will be profoundly conditioned by the rapidity and pervasiveness of the expansion of counter-trade. The current debt/liquidity crisis has combined with significant global contraction to encourage renewed attention on alternative methods of international exchange. In addition, growing protectionism in the developed nations, falling commodity prices, and developed country intransigence towards Third World demands for new rules to the global economic game, have encouraged the expansion of counter-trade. Simultaneously, the maturation of Third World nationalism has reflected itself in the increased ability of less-developed countries to negotiate 'conditioned' or 'tied' trade arrangements as a means to promote the development process. Thus, from necessity and by design, Third World nations are increasingly adopting counter-trade as a major component of their international economic interaction.

As we shall discuss below, the phenomenon of counter-trade offers incentives to developing and developed nations alike. In an era of illiquidity, uncertainty, and global industrial realignment, counter-trade appears to be an ideal mechanism for maintaining growth, promoting exports and fostering economic diversification. Should both developed and developing nations continue in the longer run to pursue such bilateral reciprocal trade mechanisms, a significant restructuring

The authors wish to acknowledge the helpful comments of numerous graduate students at the Monterey Institute and the manuscript preparation labours of Nancy Grabow and Cathy Nelson. All responsibility for errors, however, is solely due to the negligence of the authors.

of the present international arrangement would result. In this critical period of transition, international trade specialists have been split as to whether the counter-trade phenomenon is merely an *ad hoc*, transitory adjustment to the present economic morass or symptomatic of deeper structural reorientations in the global economy. For policymakers in government, multilateral organisations, and international business, the ephemeral or permanent nature of counter-trading will be crucial to successful future decisionmaking.

Thus, to ascertain the potential for future growth of counter-trading one must understand the origins, mechanisms, and current advantages of counter-trade. After exploring its dynamics, we shall suggest that counter-trade is (1) a development strategy currently being adopted by leading Third World countries that may achieve the long sought restructuring of the global economic order, albeit, in a sporadic, *ad hoc* fashion; and (2) a strategy of economic diversification accepted by some developed nations that reflects increased economic nationalism and autonomy.

Historical examples of counter-trade

The barter of goods and services between societies predates written history. Cashless societies have long designed acceptable rates of exchange that conformed to the cultural reality and needs of both trading groups. Anthropologists have marvelled over the long distance movement of goods by 'primitives' inhabiting the planet tens of thousands of years ago.¹ The key lesson, for our purposes, is that these early trading complexes were reciprocal, bilateral relationships based upon personal ties of mutual trust, benefit, and balance.

Early barter-trade complexes were based upon bilateral clearing arrangements.² When the cycle of the trading mechanism was completed, neither participant in the trading relation possessed a chronic 'deficit' or 'surplus' position. While much research has shown that one participant might have an obligation to reciprocate goods to the other trade partner at any given time, the relationship over the long run required a shifting balance between 'deficit' and 'surplus' positions.

¹ The literature of economic anthropology is filled with such accounts. See in particular George Dalton, 'Barter', *Journal of Economic Issues* (16) March 1982, p 182 and Thomas Harding and B. Wallace, *Cultures of the Pacific*, Free Press, 1970.

² This is true of modern hunter/gatherer, tribal, and chiefdom groups as well. George Dalton, *ibid*, p 181-90, and George Dalton (ed), *Primitive, Archaic, and Modern Economies: Essays of Karl Polanyi*, Beacon Press, 1971.

Chronic surpluses or deficits implied a destabilisation in the trade relationship which early 'primitives' actively sought to avoid.³ Interestingly, it is the same destabilising adjustment between chronic deficit and surplus nations that international economic systems from the *Pax Britannica* to the Bretton Woods System have failed adequately to address.⁴ Chronic imbalances between 'primitive' groups implied a breakdown of mutually shared benefits, respect, and status. In the extreme case, relationships of vertical integration evolved (ie, structured superiority/inferiority) which were and are maintained by physical, psychological, political, and/or economic coercion. It is noteworthy that the beginnings of these relationships of structured inequality in archaic trading complexes coincided with the transaction from redistributive levels of socio-political integration to the formation of the state. The advent of physical coercion and economic coercion within a centralised socio-political framework coincided with relationships based upon structured inequality—within societies as well as between societies.⁵

A second point to be ascertained from the literature on early trading systems is that exchange between 'primitive' groups generally benefitted the entire community. Traded goods were distributed for the mass consumption of the band or tribe, with elaborate ritual and cultural pressures employed to ensure wide participation in the fruits of inter-group exchange.⁶ Again, coinciding with the advent of the centralised state, the structure, volume, and division of inter-group exchange began to shift. Increasingly, dominant elites, initially religious and military, later financial, industrial, and technological, usurped control over production and trade arrangements. These structures were shaped to fulfil elite preference patterns and to enhance their superior social position.

Under such circumstances, barter was still the basis of exchange but on terms set by the central elites. An example is in the inter-colonial trade of the Spanish empire in Latin America where barter between the

³ David Thomas, 'Exchange systems among the Pemon', *Ethnology*, January 1979, pp 61-2, and lectures on Economic Anthropology, Vanderbilt University, 1979-80

⁴ It was J M Keynes who predicted that the lack of a suitable adjustment mechanism would become the Achilles heel of the present Bretton Woods system.

⁵ See Elman Service, *Origins of the State and Civilisation: The Process of Cultural Evolution*, Norton Press, 1975, and Morton Fried, *The Evolution of Political Society*, Random, 1968

vice-royalties was a common, although illegal practice.⁷ Eventually, the logic of these static, over-centralised societies created severe social, political and economic distortions. As such, they were unable to adapt flexibly in the face of revolutionary changes in science, technology, and socio-economic organisation that swept Western Europe during the fifteenth and eighteenth centuries.

By the eighteenth century, the completion of the monetisation of global society and the rise of industrial technologies combined to produce an explosion in inter-societal trade. Globally, a process of vertical integration occurred in which 'advanced' industrial nations were able to subjugate 'developing' regions with new mechanisms of political/military/economic domination.⁸ At the same time, the skilled-labour-absorptive nature of the Western industrialisation experience (along with labour unions and state redistributive intervention) allowed the fruits of technological progress and international trade to 'trickle down' and widen the internal market within developed nations.⁹ Barter increasingly diminished as a percentage of world trade as gold, pound sterling and, more recently, the US dollar provided a suitable intermediary in the structured inequality of international arrangements. In the dynamic, rapid-change orientation of the expanding capitalist order, monetary means provided rapid information flows, flexibility and convenience as the international exchange of commodities widened.

Periodically, however, barter arrangements were resurrected when global liquidity problems implied limited capacities to maintain vital imports or service existing debt. Argentina, for example, resorted to barter extensively during the 1880s and 1890s due to financial problems surrounding the global depression of that era and the reduction of money flows available for a 'high risk', uncreditworthy nation.¹⁰ In addition, highly nationalistic and protectionistic countries, eg, the US, Germany, Japan, Canada, and Italy used barter during their formative industrialization stages in the latter part of the nineteenth century to

avoid gold losses and to circumvent the use of the key currency at that time—the pound sterling.¹¹

In summary, although the world increasingly moved toward monetisation and away from barter during the eighteenth and nineteenth centuries, special circumstances sometimes required the use of non-monetary trade. Specifically, barter proved functional to (1) inter-colonial or inter-commonwealth groups (much like an intra-firm transfer of a modern multinational corporation); (2) the emergent newly industrialising nations of the 1860s and 1890s in order to facilitate nationalistic, protectionistic development; and (3) the dependent less-developed nations crippled by cyclic downturns and financial insolvency.

In the aftermath of World War I, there was an attempt to revive the gold/pound-sterling monetary system of international exchange. Yet, severe socio-economic disintegration and virulent economic nationalism once more reduced participation in such multilateral arrangements. The collapse of the global economic structure and the re-militarisation of society fostered isolationistic and predatory policies that deepened the economic contraction and heightened geo-political tensions. Bilateralism, barter, and 'beggar thy neighbour' policies dominated in such an environment during the late 1920s, 1930s and early 1940s.

In Germany, where war reparations and debt repayments placed upon the Weimar Republic were severe, hyper-inflationary monetary policies and barter appeared as a short-run expedient to service debt obligations and obtain needed imports. By the 1930s Adolf Hitler's Finance Minister, Hjalmar Schacht, was utilising barter to trade for strategic raw materials (oil, bauxite, copper) with colonies, the Balkans and European trading groups.¹² In addition, the Japanese had implemented barter-type agreements within their colonial sphere of influence (Korea, Formosa) and with nations participating in the Greater East Asian Co-Prosperity Sphere (Indonesia and Indochina).¹³ Again, access to strategic raw materials was the motivating factor for the use of counter-trade by more developed nations as well as the lack of purchasing power on the part of the weaker developing areas. At the

same time, European nations, the US and Japan employed comprehensive inter-governmental agreements of bilateral clearing to continue trade between themselves throughout the 1930s and 1940s.¹⁴

In the post-World War II era, a new monetary mechanism evolved based upon gold/dollar parity. Still, the functioning of this Bretton Woods accord was not complete or immediate. First, the Soviet Union and her allies were not participants in this system. Barter, thus, became a functional alternative for intra-East Bloc trade as well as for trade between East and West. Second, the post-war reconstruction of Europe and Japan required special programmes and massive assistance. In the shadows of an escalating cold war, US national security objectives mitigated the implementation of punitive, exploitative politico-economic structures in Europe and Japan. Instead, structures based upon mutual benefit arose, with counter-trade at the centre of such an undertaking.

In 1948, the Reciprocal, Standardisation, and Inter-operability (RSI) provisions of NATO utilised counter-trade to transfer technology, share production, and foster indigenous control over strategic military operations. Thus, military sales and the evolution of the military/industrial complexes of Western Europe and the United States have been linked since World War II by counter-trade.¹⁵ These relationships have fostered great homogenisation of NATO (and later Japanese) defence forces as well as insuring that the fruits of technological progress, employment, production, and managerial control over this major contributor to Gross National Product (GNP) have been distributed for the mutual benefit of all parties concerned. For example, in 1975, the Northrop Corporation counter-traded fighter jets to Switzerland in exchange for helping Swiss firms to market \$450 million in the Middle East. Northrop employed its extensive contacts in the Middle East to help Swiss elevator producers to win contracts in Egypt and to open several new markets for the Swiss in Saudi Arabia.¹⁶ And currently, the F-18 fighter aircraft is being co-produced by the McDonnell Douglas Corporation and various European countries in Europe as part of a NATO offset arrangement. For example, the Boeing Company is providing the North Atlantic Treaty Organisation

(NATO) with 18 AWACS radar planes. To offset the sale to NATO, Boeing is building the planes in Europe with West German and Canadian subcontractors.¹⁷

On the non-military economic level as well, bilateral clearing arrangements were implemented to allow the re-industrialisation of Europe and Japan. These agreements fostered export growth from these nations and enhanced autonomous, sustainable development. To the present day, conditions are placed upon governments and multinational corporations wishing to invest, produce, and/or trade with these more developed nations. In particular, employment of indigenous managerial capacity, technology and production sharing, and investment restrictions are utilised by European nations, Japan and the US to insure that an equitable sharing of the benefits of international interaction occurs.¹⁸

Trade within the East European nations (COMECON) and East-West trade, on the other hand, have long been based upon barter. Estimates are that 60 per cent of intra-COMECON trade flows and 50 per cent of East-West trade is counter-trade.¹⁹ From Finnish paper, textile products and ships for Soviet oil; to the German transfer of technology and expertise to build the Trans-Siberian pipeline in exchange for Soviet gas; to Occidental Petroleum's long-term counter-trade deals for the construction of petro-chemical complexes in exchange for access to Soviet markets, oil, and a percentage of the plants' output; East-West trade has been dominated by counter-trade. The Soviet Union, as well, has been a pioneer in bartering arms for strategic resources—oil, copper, tin, etc.—with developing countries. Recent swaps of Soviet arms for Libyan and Iraqi oil exemplify this relationship.

The US government, too, beginning in the early 1950s began encouraging barter under certain conditions. From 1950–73, the US Department of Agriculture used simple barter to obtain strategic materials from abroad and to provide services needed by US government agencies overseas under a barter programme established by the Commodity Credit Corporation Act of 1949 and Section 303 of the Agricultural Trade Development and Assistance Act of 1954

¹⁷ Brad Heller, 'US firms must propose joint ventures to win a slice of huge Saudi contracts', *Wall Street Journal*, 13 April 1984, p. 31.

¹⁹ James Walsh, *op. cit.*, p. 4.

(Public Law 480). Approximately \$6.65 billion worth of agricultural commodities were bartered under this programme, which was suspended in 1973 when the Commodity Credit Corporation's stock of commodities was depleted (\$1.084 billion of agricultural commodities were exchanged for strategic materials and \$4.81 billion for foreign-produced goods and services). However, the Foreign Assistance Act of 1974 re-authorised the US government to barter foreign assistance and services for strategic materials and in 1982 President Reagan temporarily revived the barter programme to complete a dairy products-for-bauxite deal with Jamaica (total \$13 million). A second US-Jamaica barter deal was signed in November 1983, exchanging dairy products for one million tons of bauxite. In 1983, an amendment (HR 3544) to the Foreign Assistance Act of 1974 reactivated the barter of US agricultural commodity surpluses for oil and strategic materials for the national defence stockpile.²⁰

Another example of modern counter-trading has been the increased use of barter, counter-purchase, and bilateral clearing mechanisms by OPEC nations. Since the 1970s, oil for arms exchanges have been important in Eastern Bloc/OPEC trade as well as advanced developing nations' trade with OPEC (notably Brazil and Israel). In addition, certain OPEC nations (Saudi Arabia, Indonesia and Venezuela) are requiring that more-developed nations import increasing volumes of refined and manufactured goods now produced by these developing nations. Complexes producing petro-chemicals, steel, vegetable oils, phosphates, urea, etc. need markets and the OPEC nations are insisting that developed nations purchase these commodities as a part of linking overall bilateral trade, investment and production arrangements. Most recently, some OPEC nations have resorted to counter-trade as a means to subvert the cartel's own limits on production quotas. Estimates suggest that 1.0-1.5 million barrels of over-quota OPEC oil are being produced daily and counter-traded (much of it to the Soviet Union).²¹

Most recently, less developed nations have begun actively to pursue counter-trade options for international exchange. After witnessing the use of counter-trade among more developed nations, between East and West, between OPEC and the rest of the world, and participating in

²⁰ For a comprehensive discussion of the US Government barter programme, see Donna V Vogt, 'US Government International Barter', Congressional Research Report No. 83-211ENR, The Library of Congress, 1983.

²¹ Dan Morgan, 'Moscow's quest for cash hurts OPEC and East bloc,' *San José Mercury*, 24 August 1984.

strategic stockpiling arrangements, most Third World nations are turning to counter-trade as a major trading arrangement. The rapid implementation of 'conditioned' trade and the extensive application of such arrangements in all areas of production, trade, investment, and technology transfer harbour the obvious potential of significantly altering the current global arrangement. After first discussing the specific mechanisms of counter-trade, we shall ignore the incentives for implementing such a trading regime.

Defining the variants of counter-trade

By definition, the term counter-trade refers to any contractual arrangement that commits the seller of a good or service to accept in partial or full payment goods or services from the buyer. Counter-trade is, thus, a 'tied' or 'conditioned' transaction in which a firm or country is compensated partially or fully by non-monetary means. Within the context of this definition, four principal variants of counter-trade can be usefully delineated.²²

The four basic variants of counter-trade are simple barter, parallel barter, import compensation barter, and bilateral clearing arrangements.

• *Simple Barter*—A simple barter transaction is the direct exchange of goods having offsetting values, without any flow of money taking place. In addition, simple barter is a one-time transaction between two parties only, occurring over a relatively short period of time. Because simple barter is fairly inflexible, it normally is limited to government-to-government agreements. Oil, arms, food, and raw material exchanges tend to dominate these counter-trade transactions.

Examples of simple barter include a \$200 million frozen lamb-for-crude oil deal between New Zealand and Iran; a wheat/frozen veal-for-iron pellets deal between Argentina and Peru; and a \$585 million steel-making-complex-for-crude oil deal between West Germany and Indonesia.²³ OPEC countries have been leading users of simple barter since 1982 as a means to subvert the mandated oil production quotas set by the cartel. Most recently, a huge \$1 billion barter of ten Boeing 747 jetliners for Saudi Arabian oil was consummated in August 1984. (This

²² A counter-trade transaction can either involve government-to-government, company-to-government agency, or company-to-company deals.
See the OECD working party of the Trade Committee North-South Trade, 'Developing country attitudes to counter-trade', May, 1984.

accord weakened already tenuous spot oil prices and generated intense speculation as to Saudi Arabia's future commitment to OPEC quotas.) The Soviet Union has also bartered arms for oil to OPEC countries, over \$2.7 billion in 1983 alone. Much of this oil has then been sold on the open market for hard currency at prices that subvert the OPEC benchmark price. The USSR, via counter-trade, has become an import intermediary for 'over-quota' OPEC oil which is resold for hard currency on world markets.²⁴ With the exception of the OPEC nations, this form of counter-trade is the least used.

● *Parallel Barter*—Also called counter-purchase, parallel barter links the value of exports to the value of imports of unrelated goods, and generally specifies that the value of the second transaction should be a percentage of the first, commonly, but not necessarily 100 per cent. The fact that counter-purchase involves payment in 'non-resultant' products—that is, products not related to any technology or plant developed by the exporting firm—affords participants a greater range of selection and flexibility in their bilateral trade regime. In addition, money is often used in parallel barter transactions because of the lag between the off-setting deliveries of goods. These agreements are generally negotiated between a government trading firm and a private firm, or increasingly, between government-run enterprises of Third World nations (ie South-South trading arrangements).

For example, countries such as Romania, East Germany and Iran require that the Japanese import 105 per cent, 110 per cent and 150 per cent, respectively, of the value of the exports Japan sends to their economies over the course of a year. This policy ensures a bilateral balance of trade surplus and enhances hard currency inflows from the more developed nation.

An example of a counter-purchase arrangement between developing nations was the 1983 accord reached by Brazil and Mexico to counter-trade over \$2 billion in specific areas of heavy industry. In this arrangement, Brazil will supply oil, sulphur, soybeans and steel technology to Mexico for petrochemicals, oil, oil industry equipment, maize and steel mill equipment.²⁵ Indonesia, in addition to the above mentioned counter-purchase provisions, requires exporting firms (1) to market targetted products produced in Indonesia; (2) to manufacture some portion of the exported product in Indonesia; and (3) to purchase some inputs from domestic suppliers. These are known as offset barter

²⁴ Dan Morgan, *op. cit.*

²⁵ Leo G B Welt, *op. cit.*, p 61.

conditions and are gaining widespread popularity in the Third World—most notable Mexico, Brazil, Nigeria, Saudi Arabia, South Korea and India.²⁶

Offset agreements have historically been used in the aerospace and defence-related industries. Recently, General Dynamics and South Korea agreed to a \$930 million deal for 36 F-16 fighters whereby the US company contracted certain fuselage sections to Daewoo Heavy Industries, Ltd, a Korean firm.²⁷ Offsets have also enjoyed popularity in the electronics industry as well as in North–South investment and trading relations.

● *Import Compensation*—In contrast to counter-purchase, which is primarily commercial counter-trade, import compensation links the exports and imports of related products and represents a focus on industrial counter-trade. The most common variant of import compensation is the buy-back arrangement, although in recent years more complicated forms such as work contracts and develop-for-import arrangements have also become important.

A buy-back arrangement entails the sale of machinery, equipment, technology, and/or turn-key plants in exchange for repayment with the resultant output. Generally, buy-back deals involve large investments by the exporting firm and long pay back periods, usually between five and twenty years. An example is Occidental Petroleum's (and other international oil companies') multi-billion dollar agreements to develop several oil fields of the People's Republic of China (PRC). Japan also has entered into long-term contracts with the PRC for technology transfer of oil, coal and steel building projects in exchange for repayment with the resultant product.²⁸ In another example, Brazil has linked with the USSR, Saudi Arabia, and Iraq to develop a uranium enrichment facility in Somalia. Brazilian construction firms will build the plant, Soviet technology and engineers will provide the enrichment machinery, the Iraqis and Saudis will finance the operation, and the Somalis will provide the uranium deposits. Each participant will be paid in uranium output for use in their respective nuclear development

²⁷ 'New restrictions on world trade', *Business Week*, 19 July 1982, p 119. 'Investment performance' is an expanding offset mechanism that Brazil, Mexico, and Canada are demanding. Under such arrangements, project approval and continuation depends upon the firm's ability to increase export levels over time.

²⁸ See Robert Dennis, 'The counter-trade factor in China's modernisation plan', *Columbia Journal of World Business*, Spring 1982, pp 67–74.

programmes—both commercial and military. The Brazilians have also linked with the USSR to build dams in Mozambique and Angola in exchange for oil.²⁹

Develop-for-import arrangements can be viewed as a form of conditioned portfolio or equity loans. An example is the provision of Japanese investment capital to develop the Gunpowder Copper mine in Australia in exchange for 23 per cent of the mine's output. Australian nationals own and operate the facility with the Japanese role being that of financier.³⁰ Similar agreements have been reached with Exxon Corporation and the Colombian government to develop the \$3 billion El Cerrejon Norte coal field, the largest coal field in the world. In this case, aspects of buy-back and develop-for-import arrangements are also being utilised.³¹ In an additional example, Japan supplied investment capital to Brazil for the construction of an alumina-aluminium complex on the condition that Brazil repay Japan with 50 per cent of the output.³² In each of the import compensation variants, it is instructive to note that capital formation, both human and physical, is being exchanged for a commodity output. Thus, an important long-run strategy for the acquisition of particular technologies and skills by developing nations is set in motion. Historically, this has been the key counter-trade technique of East-West trade. Recently, however, many Third World nations have implemented this trading device in order to stimulate capital formation.

• *Bilateral Clearing*—This form of counter-trade is based upon government-to-government trade agreements to insure bilateral balance in the international accounts. This balance assures that no net drain of foreign exchange will occur between the signatory parties. In the past, such trade imbalances have seriously weakened attempts by developing nations to promote regional economic integration. The wide gaps between surplus and deficit nations have been at the root of tensions within the Central American Common Market, the Andean Bloc, the Association of Southeast Asian Nations (ASEAN), and the break-up of several African regional groups. ASEAN nations are currently practising bilateral balance within that group and increasingly requiring similar agreements with external trading nations. This form of

³² James Walsh, *op. cit.*, p 7

counter-trade is thought to have the potential of regenerating regional economic cooperation and fostering greater South-South trade.

In the event that trade imbalances result at the end of the bilateral clearing agreement, credits can be used as purchasing power (eg, Brazil and East Germany have established such an arrangement)³³ or surplus commodities can be sold to 'switch' traders at a discount, who then market the goods internationally. One example of switch trading was Malaysia's agreement to take payment in cocoa from Mexico in exchange for Malaysian rubber. The cocoa was then sold, for US dollars, to US confectionery makers.³⁴

Also, government-to-government 'swaps' of materials that have high transport costs or are highly perishable are an increasingly important form of bilateral clearing. Australia and Mexico agreed to counter-trade lamb for oil. US companies and China also linked to trade lamb/beef for oil. To cut transport costs, the US firms shipped lamb to Mexico for oil, and Australia shipped lamb to the PRC for oil. A second example is that of the USSR supplying customers for Mexico's oil in the Middle East while Mexico sells oil to Cuba, a Soviet customer. A similar 'swap' has been utilised by Venezuela, West Germany, Cuba and the USSR. In 1983, Soviet oil for Cuba was diverted to West Germany and Venezuelan oil for West Germany was diverted to Cuba.³⁵

The scope of counter-trade

Estimations vary enormously concerning the true magnitude of counter-trade. The reasons for such diverse data projections are numerous. In the first place, counter-trade transactions are not specifically tabulated in standard national accounts data. In the second place, most nations are reluctant to acknowledge counter-trade activity for obvious political reasons, especially as the US, IMF, IBRD, and GATT have openly opposed mandated counter-trade. Third, most multinational corporations are hesitant to divulge counter-trade activity so as to preserve client anonymity. And fourth, most estimates are based on rumours of 'proposed' transactions rather than actual deals. Since many specialists feel that a 10-1 ratio exists between counter-

trade proposals and consummated deals, estimates that counter-trade represents 50 per cent of world trade are highly exaggerated.

Still there are ranges of plausible estimations. Probably the most conservative plausible estimate has counter-trade (excluding bilateral clearing) at 6 per cent of the total \$2.5 trillion world trade—or around \$150 billion.³⁶ Gary Banks, an economist with the Secretariat of GATT, has argued that for counter-trade to be 25 per cent of total world trade, all of world trade outside the OECD would have to be counter-trade (LCDs 16 per cent, Eastern Europe 9 per cent and OPEC 8 per cent).³⁷ Yet, counter-trade is only 50 per cent of East European trade and much less for other countries. At the upper range of the plausible are Business International and Gary Hufbauer, an economist at the Institute of International Economics, who have suggested that 12–15 per cent of world trade occurs within some form of counter-trade relationship. *The Economist* (London) has recently published a survey on counter-trade which estimates 20 per cent of world trade is now under this trading pattern.³⁸

Approximately one hundred nations in the world (both North and South) currently require some form of counter-trade provision, and numerous others are considering its adoption. Roughly half of East-West trade is counter-trade. Over half of the Fortune 500 companies now have separate counter-trade divisions and most of the rest are examining the potential for creating in-house capacity.³⁹ So, while the exact magnitude of counter-trade may be uncertain, there is no doubt that the growth of counter-trade has been explosive and that the trend toward counter-trade is clearly increasing.

This fact is significant in that during a time period of overall world contraction of trade (1980–83), counter-trade has increased dramatically. Recent interviews with representatives of major MNCs, the American Counter-Trade and Export Association, and the US Departments of Commerce and Treasury, suggest that the rapid growth

³⁸ 'Why LDC's want—or think they want—countertrade', *Business International* 31 (35) 31 August 1984, p. 274. Estimations from Gary Hufbauer and *The Economist* were obtained from interview with William Rouse.

³⁹ 'Counter-trade phenomenon is spreading globally in scope and intensity', *Business International* 30 (51) 23 December 1983, p. 354.

of counter-trade has not yet abated—in spite of a rebound in world growth and trade during 1984–85.⁴⁰

One explanation for the competitive vigour of counter-trade has been the dramatic fall in the transaction costs of such arrangements. The computer has played a key role in linking buyers and sellers with counter-trade around the world. In Brussels, a counter-trade clearing house was established in 1983 in order to facilitate the global networking of counter-trade activity. Also, informal computerised barter exchanges exist in Paris and Vienna, and the American Counter-Trade and Export Association is in the process of establishing a US exchange in Cleveland, Ohio. Governments are also becoming involved. For example, the Swedish government recently purchased an 8 per cent share in Sukab, a counter-trade organisation formed in 1940 by major Swedish exporters. The French government has sponsored the formation of a counter-trade advisory organisation, ACECO (Association pour la Compensation des Echanges Commerciaux), and in Miami, Florida, the state legislature has authorised the establishment of an 'international barter exchange centre'.⁴¹

Governments, multinational corporations, and counter-trade specialists now are able to quickly and efficiently market products in a centralised setting. As a result, discounting on counter-trade products has fallen markedly. In the late 1970s and early 1980s, discount rates of 25 per cent–40 per cent were not uncommon in counter-trade agreements. By 1984, discount margins had dropped to 3 per cent–7 per cent with many specialists stating that rates will continue to fall as counter-trade expands and computerisation continues. Discounts, also, will vary according to the ease of disposal of the goods. Generally, raw materials carry the lowest rates of discount (under 5 per cent) while hard-to-market manufactured goods carry the highest discounts.⁴²

The formation of the South Bank will also provide developing nations with the opportunity to expand counter-trade. Facilitating counter-trade will be a major goal of this new Third World financial agency.⁴³ US policy has also facilitated the use of counter-trade in business

⁴⁰ Based upon interviews conducted by William Rouse in Cleveland, New York, and Washington in August/September 1984.

⁴¹ The Florida centre, authorised by an Act of the Florida legislature in June, would be the first international barter exchange centre. The centre will be governed by a 15-member board of directors, appointed by the State of Governor and legislative leaders. It will have a trading floor similar to that of the New York Stock Exchange or Lloyds of London.

⁴² Leo G B Welt, *op. cit.*, p 17.

⁴³ 'A helping hand for South-South trade'. *South* (London) March 1984, p 64.

transactions. In 1982, the US Export Trading Company Act allowed US banks to enter into trading relationships worldwide. This legislation was primarily intended to counter Japanese trading companies and to promote US exports. However, the ETCs will also enable US traders to engage in the growing counter-trade nexus. Similarly, the East European nations have begun to integrate their financing, trading, and production sectors into a single organisation, 'combinats', that will enable more competitive trade and counter-trade relations. Thus, on many levels, counter-trade 'infrastructure' is rapidly evolving to support the expansion of 'conditioned' trade.

The key countries who counter-trade outside the Eastern European nations are Indonesia, Iran, Brazil, Colombia, Mexico, the PRC, Canada, and Australia.

Each of these nations has well-defined programmes for counter-trade as part of their overall development plan and each has openly stated their goals of expanding this method of international interaction. We now explore the reasons for its ascendance and its implications for global relations.

Incentives to counter-trade

'Intensive economic nationalism marked the decade. Exports were curtailed. All the weapons of commercial warfare were brought into play; currencies were devalued, exports were subsidised, tariffs raised, exchanges controlled, quotas imposed and discrimination practiced through preferential systems and *barter deals* (emphasis added). Each nation sought to sell much and buy little. A vicious spiral of restrictionism produced a further deterioration in world trade.'⁴⁴

Written in 1949 to describe the global trading environment of the 1930s, the striking similarities to the 1980s suggest longer term processes in our global economy. These periodic cycles of boom and bust, the so-called Kondratiev-Schumpeterian long waves, have historically been closely associated with intensified utilisation of counter-trade as a mechanism of international exchange. While leaving the important discussion of 'long wave' dynamics aside,⁴⁵ it is necessary to stress the increased importance of counter-trade as a method of *circumventing* (at least over the short term) the down cycles of global economic activity. In addition,

⁴⁴ William Rouse, 'Counter-trade,' unpublished paper, Spring 1984.

⁴⁵ Many modern scholars (Jay Forrester and David Gordon among others) have offered various explanations for the empirical fact of forty to fifty year boom/bust cycles.

counter-trade and other protectionist, neo-mercantilist devices were historically important in *exacerbating* (in the long run) the economic stagnation that accompanied periodic depressions in the international system.

The global stagnation of the late 1970s and 1980s provides yet another crucible in which to evaluate the impact of counter-trade as a trading device. Again, as in other cycles of economic contraction, the short-term benefits of administered trade have been significant. While the longer term benefits/costs are yet to be determined, there are some indications that qualitative changes in technology and global geopolitics may render past experiences with counter-trade inappropriate as guides to future impacts.

Short-run exigencies

The proximate cause of the emergence of counter-trade in the trading regimes of developing nations has been the debt crisis.⁴⁶ The resultant lack of liquidity (ie US dollars) available to developing nations fostered the need for creative alternatives to maintain required imports and to promote exports.⁴⁷ Counter-trade provides such a mechanism for Third World nations to accomplish several short-term objectives: hard currency is conserved; required imports of machinery, food and pharmaceuticals can be maintained; traditional and new exports can be promoted; and growth can be stimulated/maintained in the export sector as well as the import substitution industrial sector.

By counter-trading surplus raw materials for needed imports, nations

⁴⁶ The debt crisis itself is a manifestation of the breakdown of the over-centralised, hierarchical, and elitist growth models pursued by policymakers in past decades. Whether North or South, East or West, strategies of import substitution, capital/petro-chemical intensive industrialisation, state enterprises, export enclaves, and oligopolistic conglomeration have fostered protectionism, gross inefficiencies, heightened inequalities, the demise of participatory democracy, and non-sustainable growth and development. The seeds of a viable society lie germinating at this moment. Whether a new generation of thinkers and policymakers will activate this potential capacity will be the primary debate for the remainder of this century.

⁴⁷ The accumulated and growing debt of the Third World, estimated at \$850 billion today, and the current strength of the US dollar in which most of these nation's debt is denominated, has encouraged the growth of counter-trade practices. In addition, the reduction of trade finance to less developed nations has forced them to consider counter-trading practices. According to the Bank for International Settlements, bank lending to developing countries increased by only \$4.7 billion from the end of 1982 to the end of 1983, compared with a growth of \$17 billion for the first half of 1982. Also, banks and Western exporters continue to limit trade finance and export activities in these countries to transactions involving minimum risk. And for specific nations, net capital outflows have been recorded from 1982-4. In addition, the IMF recently (January 1985) announced that lending to developing nations dropped from \$13.3 billion in 1983 to \$7.5 billion in 1984. The liquidity crunch is very real for developing nations.

can benefit in the short run by (1) conserving hard currency that otherwise would have been spent on importables; and (2) indirectly providing a price support for those primary export products. Hard currency can then be used to repay interest on loans, the balance of trade position appears more favourable, and the value of its exports which earn hard currency can be preserved (at least in the short run. In the longer run, however, if many nations engage in such a practice, prices will eventually fall for all).

Generally, Third World nations sell commodities for which they have a comparative advantage and/or established markets for hard currency generation. Counter-trade, as a rule, is utilised to market new products for which (1) no market channels exist; (2) protectionistic barriers exist; and/or (3) inferior quality prohibits sales in more developed nations. Thus, manufactured products produced by an 'infant industry' can enter the world market while enjoying continued tariff protection as well as the marketing skills of multinational corporations.

Increasingly, hard currency products will be counter-traded (1) to other cash-strapped nations (ie, several deals of Mexican and Venezuelan oil for Central American coffee, bananas, and cattle); (2) in conditions of excess supply (as now confront the markets for oil, copper and tin); or (3) where import compensation schemes allow the transfer of high technology, turn-key plants, and/or managerial concessions for resources (as exemplified by the oil, coal, and copper deals between China and Japan).

In essence, counter-trade allows a country facing severe problems of illiquidity, due to reductions in multilateral and commercial bank lending, falling prices for its export commodities, devaluations, and net capital outflows, to maintain existing economic strategies for growth and to avoid extreme deflationary prescriptions for adjustment in the short run. In the absence of counter-trade, large debtor nations such as Mexico, Brazil, and the Philippines would virtually have to use all of their export earnings to service their debts.⁴⁸ Thus, as a short-run expedient, counter-trade has been successfully implemented to avoid the deleterious side-effects of periodic global contraction.

Medium-term incentives

Since the early 1970s, dramatic changes in the international economic system have required Third World nations to adjust domestic policies to

⁴⁸ David Yoffie, *op. cit.*, p. 36.

accommodate global market pressures. Over the course of the past fifteen years, unprecedented 'liberalisation', de-regulation, and global integration have simultaneously appeared on the world economic scene. The shift to a floating exchange rate world with the value of currencies determined by global decisionmakers marked the watershed point for this era of change. Financial de-regulation, floating interest rates, and the privatisation of lending followed in short order. As international production expanded, the de-oligopolisation of commodity markets (oil, copper, tin, rubber, etc) and of manufactured production intensified the volatility of international prices for traded goods.

For Third World nations, these changes culminated in growing debt imbalances, declining terms of trade, and stagnating growth. As import substitution industrialisation steadily lost its capacity to generate growth and the international lending community lost its enthusiasm to finance and invest in development projects, Third World nations increasingly were forced to turn to the International Monetary Fund (IMF) for liquidity needs. Yet, the IMF 'conditions' implied internal 'liberalisation', 'de-regulation', and increased integration into the volatile international financial/investment system. And history has shown that for those who attempted to follow this radical neo-conservative stabilisation orthodoxy in the late 1960s and 1970s (ie. Brazil, Argentina, Chile, Uruguay), the results have been equally disastrous.⁴⁹ Countries which re-exposed themselves to monocultural export dependence experienced the stultifying effects of industrial involution.

Thus, counter-trade provides a means to overcome the limitations of economic models of the past. At the same time, counter-trade offers dynamic advantages for the future development of Third World economies. In the medium term, counter-trade promotes several important gains that will enable Third World nations to obtain a larger role in decisionmaking and control over economic processes. Counter-trade fosters stability in industrial planning, terms of trade support, diversified trade relations, a new 'partnership' with multinational corporations, bilateral balance, and disguised austerity programmes.

Because of the volatile nature of demand patterns for Third World exports, many nations view counter-trade as a method of stabilising

⁴⁹ See Alejandro Foxley, *Modern Experiments in Neo-Conservative Economics*, University of California, 1983.

their export revenue profile. With counter-trade, known exports can be paired to desired imports which facilitates the planning of industrial and agricultural development strategies. In this way, periodic external imbalances and the associated IMF-mandated economic contraction can be avoided. With access to new loans declining, the hard choice for government planners is (1) whether to deflate under an IMF austerity programme and hope for international 'trickle down' to regenerate growth; or (2) implement counter-trade policies immediately in order to return to a growth trajectory. Counter-purchase and compensation arrangements are a primary method of stabilising the fluctuating demand for Third World raw materials so that effective long-term planning can proceed. As a result, most less developed nations now counter-trade on a sectoral basis (ie automobiles, oil, railways) to foster overall planning.⁵⁰

In addition, these counter-trade techniques can act as a price support mechanism, thus, maintaining the terms of trade over a longer period of time. In comparison to the volatile nature of international market pricing regimes, counter-trade can reduce the destabilising swings in the relative values of imported to exported goods. Counter-trade is perceived by Third World planners as a key means to stabilise export revenues and import costs where, in the past, attempts to implement such arrangements through cartels have largely been unsuccessful. For example, the ASEAN nations have asked Japan, the EEC, and the US to counter-trade as a means to hold up the real purchasing power of their major exports.

Liquidity and terms of trade are not the only motivating factors that encourage linkage. Many countries (including South Korea, Indonesia, Malaysia, Saudi Arabia, China, Australia and Canada) insist upon counter-trade in spite of solid foreign reserve holdings. For these industrialising nations, linking trade flows is a major tool by which diversification of trading partners and the exertion of national sovereignty over multinational corporations can be achieved. Through diversification, the risks of geo-political chaos can be reduced. Important South-South trading patterns can be cultivated as well. In addition, greater outlets for exportable goods and increased sources for importable goods create a more competitive market, which tends to increase export earnings and to reduce import costs. Counter-trade enables Third World nations to increase the flow of technology, foster

⁵⁰ John Wicking, *op. cit.*, p 7.

new market penetration, new product development, and demand the acquisition of marketing skills by requiring such linkage from multinational corporations. Nationalist governments with a large market potential and/or resource wealth have been able to win such concessions and require that new investments produce larger corresponding export sales. Multinational corporations can also be enlisted to overcome more developed nation protectionism by marketing Third World goods.

Third World planners have sought to eliminate balance-of-payments crises by bilaterally balancing their international accounts. Many industrial and trade activities in Third World nations are nationalised and conducive to counter-trade. Thus, bilateral clearing arrangements between governments and between state trading enterprises have become widespread over the past five years. In addition, *investment performance* conditions placed upon private investors (as in the case of Mexico and Brazil) have insured a favourable balance on these transactions as well. Under investment performance, foreign producers are required to increase their export growth over time to continue to qualify for favourable tax and tariff treatment.

Bilateral balance can also reduce net currency outflows that accompany balance-of-trade deficits. Malaysia recently diversified its imports of rice by increasing imports from Burma (with whom Malaysia runs a balance-of-trade surplus) and reducing rice imports from Thailand (with whom Malaysia runs a balance-of-trade deficit). By means of counter-trade, bilateral balance and diversification of trading relationships were obtained. Colombia also is utilising counter-trade to maintain a positive trade balance. In April 1984 the Colombian Institute of Foreign Trade (INCOMEX) prohibited and/or severely restricted the importation of more than 2,000 products, and set aside thirty-three product categories for counter-trade in order to improve its current account situation. In addition, the counter-traded goods must be above and beyond Colombia's normal export levels.

Interestingly, counter-trade can be utilised as a disguised imposition of an economic austerity programme—without overtly resorting to discriminatory tariff barriers. Third World nations that want to cut imports (and the standard of living) can impose stringent counter-trade regulations and then blame foreign corporations for the lack of imported goods.⁵¹ Protection is, thus, afforded to domestic producers

⁵¹ David Yoffie, *op. cit.*, p. 36.

without subverting the present guidelines of the General Agreement on Tariffs and Trade (GATT). Also, counter-trade can be employed as an alternative to an explicit export subsidy, devaluation, or cartel pricing guidelines. By accepting higher prices for imported goods for the same amount of exported commodities, counter-trade becomes a form of discounting that again is not within the coverage of the existing GATT framework.⁵²

Finally, counter-trade can actually result in greater control over the international debt imbalance since banks will not provide trade financing for counter-purchase deals unless both contracts are backed by readily available goods. Thus, a balancing check against the borrowing excesses of the past is conveniently performed by the counter-trading mechanism. Also, since many counter-trade deals are long-term in nature, one of the participants is implicitly receiving an advance loan. Counter-trade, thus, can bridge the liquidity problem from the financing side as well (East Germany, for example, owes Brazil [of all countries] over \$1 billion in clearing account units that are due in two years, effectively giving the East Germans an interest-free loan.)

Over the medium term, counter-trade is perceived to be highly advantageous by Third World nations. Development planning is enhanced, the distribution of benefits in international interaction is improved, balance of payment distortions are avoided, and goals of economic sovereignty are achieved. In a world of illiquidity, structural transformation, and crisis, counter-trade can provide a stable development option for Third World planners.⁵³

⁵² For this reason, the Reagan Administration has called for a new 'Round' of GATT talks to focus upon mechanisms to control counter-trade and to force Third World nations to liberalise their control of service sector items (ie, computers, banking, insurance, internal shipping/transport, utilities). Obviously, nationalist less-developed nations have not greeted the prospects of the 'Reagan Round' with enthusiasm.

⁵³ From the authors' viewpoint, only a massive infusion of new liquidity into the international system could slow the rapid spread of counter-trade. Without the rapid availability of credits to revive growth in less developed nations, the political, social, and economic costs of long-term IMF deflation will not be tolerable. The options are for:

- 1) US dollar expansion
- 2) Japanese Yen expansion
- 3) British Pound Sterling expansion
- 4) German DeutschMark expansion
- 5) SDR expansion
- 6) other multilateral agency expansions
- 7) private commercial bank expansion
- 8) direct foreign investment expansion.

The governments of the top four alternatives are monetarist in orientation and have historical

Advantages for the North

Although the primary focus of our discussion has centred upon the beneficial incentives that counter-trade offers to Third World nations, it would be incomplete to ignore the important incentives that have induced more developed nations and their multinational corporations to enter the 'linkage' game. While many researchers critical of counter-trade have stressed the long-run 'zero sum' nature of bilateral trade regimes,⁵⁴ powerful incentives, both positive and negative, have compelled decisionmakers to enter the 'only game in town'.

More developed countries have not been immune to the growing instability of global market forces that have characterised the past fifteen years. In particular, the Japanese, Canadians, and Europeans began to implement policies in the late 1960s and early 1970s that would reduce their heavy dependence upon strategic raw materials imported from the US. Global diversification of sources for raw materials (oil, coal, copper, soybeans, rubber, tin, etc.), sources to market manufactured goods, sites for offshore production, and sources for international investment have been an important component of these developed nations' economic policies. The Third World has been the central recipient of these diversification strategies. Clearly, economic self-interest as well as national security issues have combined to foster policies that would lead to reduced exposure to the geo-political vagaries of any particular nation. Counter-trade has been received with greater enthusiasm by Japanese, European and Canadian governments and corporations as it is perceived to be a mechanism to improve long-term flexibility and economic sovereignty.

For example, the Japanese have been the most willing nation to accept counter-trade concessions in order to diversify their heavy

fears of runaway inflation to temper their enthusiasm for such re-inflation. The major industrial governments recently nixed a proposal to increase by \$15 billion the present allocation of SDRs. In addition, the 'Big Four' have proposed and supported real cuts in financing for several multilateral agencies. And finally, the evidence from many sources, including the Bank for International Settlements, has amply documented the major reductions in net lending that is available to Third World nations from the commercial banking sector. Direct foreign investment has been lagging as well.

The prognosis on *all* of the available options for increased liquidity for less developed nations for the rest of the decade is not encouraging. As such, counter-trade truly is the 'only game in town'.

⁵⁴ See in particular the objections made by Gary Banks (GATT Economist), Ed Barber (Treasury Department Economist), James Walsh (Commerce Department Economist) and Carmen Suro-Bredie (Office of US Trade Representative). These researchers have mainly utilised the neo-classical economic framework to analyse the pros and cons of counter-trade

dependence on imported oil. Nigeria, Indonesia, Peru, Ecuador, Mexico, Iran, Iraq and Saudi Arabia, among others, have established formal counter-trading relationships to exchange oil for manufactured goods. Similarly, the Japanese engage in extensive compensation, buy-back and technology transfer agreements with China (coal, oil, bauxite, copper), Australia (copper, uranium, coal), Chile (copper), Brazil (soybeans, aluminium, bauxite, iron ore), the USSR (timber, oil), Indonesia (oil), etc.

The resource-dependent Europeans, too, have been willing to grant counter-trade concessions in exchange for long-term stability in supply and access to internal markets. The West Germans have linked with the PRC for oil, numerous Middle Eastern nations for oil, and Brazil for copper, bauxite, and uranium. The French have been active counter-traders in Africa and the Middle East, again for long-term supplies of raw materials. The British, while less active, have also engaged in counter-trade in India, China, and Africa.

The specific positive inducements to counter-trade afforded to more developed nations are numerous. They include diversified raw material supplies, diversified market sourcing, access to new markets, expansion of existing markets, a means to unblock frozen profits/dividends, tax and tariff dodges, and 'good faith' gestures by image-conscious multinationals.

Since counter-trade is the 'only game in town', reticent corporate managers risk losing existing markets in the Third World as well as potential markets if they choose not to counter-trade. This negative incentive can be extremely powerful for corporations that must show solid growth performance in a quarter-to-quarter evaluation system. For example, Spain's ENESA was able to win a contract to supply buses for Colombia because they included a counter-trade provision to buy Colombian coffee. ENESA had not been the lowest bidder but had offered the most favourable counter-trade package. Another example involves a US corporation. General Electric lost an important contract for the sale of CAT scanners to Austrian hospitals when Germany's Siemens agreed to increase production of electrical goods at a plant it operates in Austria. Although General Electric had been the lowest bidder, Siemens was able to offset the purchase of its scanners with additional Austrian employment and thus won the contract.⁵⁵

⁵⁵ Stephen Cohen and John Zysman, 'The mercantilist challenge to the liberal international trade order,' Report presented to the 97th Congress, 2nd Session, Joint Economic Committee, 29 December 1982.

Many multinationals have also viewed counter-trade as a means to free profits and dividends locked inside financially troubled developing nations. By counter-trading for goods at 'artificial' intra-firm prices, commodities can be exported from the troubled nation, sold on the international market, and repatriated to the home country for use. Many multinational banks have utilised this method to obtain delinquent interest and principal payments from cash-poor less-developed nations. An additional advantage that can be used by multinational corporations and private domestic companies is the technique of under-valuing counter-traded commodities to reduce exposure to the tax and tariff laws of Third World nations.⁵⁶

Finally, some Western companies will employ counter-trade as a 'good faith' exercise in order to win long-term sales contracts. By establishing themselves as reliable trading partners, multinationals hope to maintain market links and to create new 'favoured' arrangements in the future.

Recently, more developed nations have themselves begun active counter-trading (as opposed to the reluctant passive counter-trade outlined above). Counter-trade can reduce the costs of expensive capital development incurred by multinational corporations. By moving into the downstream linkages of marketing, information processing, and management, costs and risks can be shifted toward developing nations while more profitable activities can be performed by the multinationals. Other governments have sought to actively pursue 'linked' raw material or manufacturing production. France requires buybacks on metal processing equipment sales financed by government credits. Recently, an aluminum refinery was built in India by France whereby France will be repaid in 50 per cent of the annual output.

For the US, the traditional rhetoric for 'free-trade' has inhibited a strong shift toward counter-trade. Still, in strategic metals, grains, and aerospace, the US has been willing to participate in barter arrangements. While officially opposed to counter-trade, the US Export Trading Company Act of 1982 will facilitate US multinational corporation involvement in 'linked' trade.

As more developed governments and multinational corporations increasingly join the counter-trade system, the long-run dynamics of the mechanism will further integrate the global economy and fundamentally alter the existing status quo between the North and the South.

⁵⁶ Leo G B Welt, *op. cit.*, p 11; and *Business International*.

**The long-term benefits of counter-trade:
economic sovereignty and the NIEO**

Counter-trade represents a substantial and growing departure from the principles of multilateral and largely monetised trade of the post-World War II years. . . . By compelling more developed countries to accept part payment in commodities and to take back additional exports, primary producers are circumventing the international pricing mechanism and achieving what decades of negotiations on international commodity agreements and cartels have failed to achieve.⁵⁷

It is in the longer term that counter-trade offers the most enduring changes for the global system. The maturation of political nationalism and the emergence of struggles for economic self-determination have coincided with the present economic crisis and the transformation of the global economy. For Third World nations, the doctrine of national sovereignty over natural resources along with the emergence of the state as an active participant in economic development have provided the conditions whereby changes in the structures of inter-societal interaction can be made. Having direct experience with the long history of 'managed/administered' trade and having participated in such arrangements, Third World nations are now in a position to utilise this mechanism to alter the terms of trade, distribution of benefits, technology transfers, and flows of resources on a global basis.

Counter-trade, as initially an adaptation to profound economic crisis, has evolved into a strategy by which Third World nations can create a *de facto* NIEO. Many of the stated goals of the NIEO (ie increased technology transfer, improved terms of trade, a new 'partnership' with multinational corporations, greater access to more-developed nation markets, more favourable resource flows from North to South, and enhanced self-reliance in food, energy and defence) are accomplished via counter-trade without a formal multilateral declaration of such a radical restructuring. Over the longer term, counter-trade provides the potential whereby global institutional structures can be reshaped to foster a mutual 'dependence' built upon respect, benefit, and cooperation.

For developed nations as well, counter-trade can be a useful long-term mechanism by which greater economic autonomy can be obtained. For the resource-dependent nations of Europe and Japan, diversified input supply and market sourcing enhances their national

⁵⁷ 'Special report: going under the counter', *op. cit.*, pp 49-56.

security and promotes expanded influence within the Third World. By overtly linking their long-run economic destinies with developing nations, cooperative relationships are created that spill over into social, political, and strategic security areas to the benefit of both parties.

It is important to stress that the maturation of Third World nationalism and the enhanced capacity of decisionmakers effectively to debate complex economic issues will intensify the use of counter-trade as a long-term tool for restructuring the global economy. Developing countries have a clear understanding of the inner-working of the global economic system and of the dynamic areas within which they want to participate. As such, the leverage of cheap labour, abundant natural resources, and rapidly growing markets will be linked to the redirection of rewards, information access, and technology flows in international interchange. Having experienced the distorting effects of past development models (ie from classical comparative advantage, to import substitution, to state planning, to debt-led growth), nationalist Third World nations are attempting a new strategy. Counter-trade reflects the accumulated wisdom of past experiences as well as a sense of newly obtained economic power that many nationalist developing nations are able to wield in determining the next economic 'order'.⁵⁸

Thus, the long-run incentives to counter-trade are a combination of political and economic factors. For Third World nations and advanced industrial nations, long-run political and economic sovereignty are the motivating bases for the rapid adoption of counter-trade.

Conclusions: policy response

Counter-trade is a mechanism that will fundamentally transform international economic relations. For Third World nations, the widespread adoption of 'linked' resource flows represents a new model which potentially can lead to a mutually dependent world community based upon the principles of mutual trust, respect, benefit, and cooperation. Counter-trade as a development model is reshaping inter-societal relations and will widen the range of human resource potential available to the world society.

Yet, nationalist Third World decisionmakers must also recognise that external 'linkage' is a necessary (but not a sufficient) requirement for achieving sustainable, equitable growth. The logic of counter-trade

⁵⁸ It is important to note that many resource-poor and market-poor developing nations may *not* be able to benefit from the growing counter-trade alternative. Poorer nations with weak negotiating positions could find themselves by-passed by the 'only game in town'

must also begin to be implemented internally within Third World nations if the gains from international restructuring are to be effectively absorbed. Self-reliance, participation, control over resources, and the mutuality of trust, benefits, and respect must simultaneously be cultivated among the population of developing nations. Counter-trade, if it endures, will require a radical transformation of relationships in both the external and internal institutional arrangements of economic, political, and social interaction.

For decisionmakers from more developed nations, counter-trade must be recognised as a culmination of a lengthy historical process whereby the forces of political and economic liberation/sovereignty in the Third World have come of age. Attempts to ignore, subvert, or roll back this inexorable process will only engender hostility and exclusion from the most dynamic growth regions on the planet. Policymakers must take the broader view of planetary realism—that economically, ecologically, and politically our destiny as a human species is tightly interwoven. In so doing, counter-trade can be a mechanism by which advanced industrial nations can begin a shift toward fair trade and, thus, avoid the encroaching reality of predatory competition, protectionism, and global economic stagnation.

Over the coming decade, developing nations will continue to employ counter-trade techniques to develop their export capacities in resources, manufactured goods, and high technology products. Already the US and the EEC have been adversely affected by the influx of foreign cars, steel, electronics goods, etc. But this is merely the tip of the iceberg. Over the rest of this decade a veritable tidal wave of high technology goods, petro-chemical products, agricultural products and raw materials will increase the pressure on US and EEC producers. For these developed nations the difficult choice will be whether to impose greater protectionism as a short-term expedient or to begin playing the 'conditioned' trade game in a concerted, coherent manner. Viewed dynamically, counter-trade offers a transition model toward the return of institutions which promote the positive capacities of a healthy, sustainable society—mutual trust, mutual respect, mutual benefits, mutual cooperation, and mutually reciprocal obligations. After some 5,000 years, the species may have come full circle.

The Franc Zone, underdevelopment and dependency in Francophone Africa

The Franc Zone (FZ) is a monetary cooperation arrangement that was set up between France and her former colonies in West and Central Africa following the latter's independence in the early 1960s. While this system is central to an understanding of these African countries' dependence on France, it has been the object of surprisingly few genuinely scientific studies. The mainstream literature on the subject consists mainly in dithyrambic apologies for the FZ system expounding on the many assumed advantages and virtues of that system which is seen as essentially beneficial to all its member states.¹ Recently, a number of young, radical (mostly African) scholars have boldly challenged the establishment's conventional wisdom on the subject through some perceptive, original and well-documented studies.² The present study clearly identifies with the latter trend. It is an attempt to take a fresh look at the facts through the prism of dependency theory. The purpose of the study is to analyse the origin, structure and functioning of the FZ system and to assess its legal, political and economic consequences for the African member-states. The evidence suggests that contrary to the prevailing view, the FZ, far from contributing to the economic development and independence of its

¹ The following constitute a representative sample of this literature: J Alibert, 'La zone franc: intelligence et réalisme', *Afrique contemporaine* (126) April 1983, pp 3-13; J Bourdin, *Monnaie et politique monétaire dans les pays africains de la zone franc*, Dakar: Nouvelles Editions Africaines/NEA, 1980; and B Vinay, *Zone franc et coopération monétaire*, Paris: Ministère de la Coopération, 1980. Also related to the same approach, the study by P and S Guillaumont, *Zone franc et développement africain*, Paris: Economica, 1984, stands out as a serious, exhaustive and competent piece of research.

² Illustrative of this new approach are: A Bourgi, *La politique française de coopération en Afrique*, Paris and Dakar: Librairie Générale de Droit et de Jurisprudence (LGDJ/NEA), 1979; M Diarra, *Les états africains et la garantie monétaire de la France*, Dakar: NEA, 1972; J Tchundjang Pouémi, *Monnaie, servitude et liberté*, Paris: Editions Jeune Afrique, 1980; and K Yansané, *Contrôle de l'activité bancaire dans les pays africains de la zone franc*, Paris and Dakar: LGDJ/NEA, 1984.

African member-states, is largely instrumental in perpetuating and increasing these states' underdevelopment and dependency on France.

Approach, methodology and analytical framework

The present study belongs to the dependency school of thought which views the state of underdevelopment and dependency in the periphery as being the result of transfer and exploitation mechanisms inherent in the functioning of the world capitalist system itself.³ Although these two aspects—underdevelopment and dependency—are inseparable in the logic of the dependency theory, the latter, rather than the former, will be the focus of our analysis. Dependency of the periphery countries on the centre countries may take various forms. It can be political, economic, technological, military or cultural. This study will be essentially concerned with political and economic dependence.

What is the meaning of 'economic dependence'? Dos Santos provides a precise and exhaustive definition of this concept:

By dependence we mean a situation in which the economy of certain countries is conditioned by the development and expansion of another economy to which the former is subjected. The relation of interdependence between two or more economies, and between these and world trade, assumes the form of dependence when some countries (the dominant ones) can expand and can be self-sustaining, while other countries (the dependent ones) can do this only as a reflection of that expansion, which can have either a positive or a negative effect on their immediate development.⁴

African states should, on the contrary, strive to achieve a minimal degree of economic independence which, according to J Rweyemamu, implies

Control over economic decision-making and the national economy, the establishment of a firm industrial structure leading to a self-generating and self-sustaining growth, and a diversification of external economic contacts consistent with the nation's economic interests.⁵

This ideal situation is, however, far from the observable African

³ Leading exponents of this school of thought are: S Amin, *Accumulation on a World Scale*, New York: Monthly Review Press, 1974; A G Frank, *Dependent Accumulation and Underdevelopment*, London: Macmillan, 1978; and I Wallerstein, *The Capitalist World-Economy*, Cambridge: Cambridge University Press, 1979.

⁴ T Dos Santos, 'The structure of dependence' *American Economic Review* 60 (2) May 1970, p 231.

⁵ J Rweyemamu, *Underdevelopment and Industrialisation in Tanzania*, Nairobi: Oxford University Press, 1973, p 38.

reality. In general, African countries find themselves in a state of acute and persisting economic dependency *vis-à-vis* the Western capitalist countries. Financial and monetary dependency is itself one of the main elements of this economic dependency. In this respect, we tend to disagree with Amin when he says that 'the main structural characteristics of dependency and underdevelopment are not found at the monetary level'.⁶ On the contrary, we are of the opinion that financial and monetary autonomy is a crucial component of the sovereignty of Third World states. Indeed, these states rightly view the possession of a national currency as one of the essential attributes of national sovereignty, along with the flag and national anthem. In this perspective, the study of the financial and monetary dependency of African states takes on a particular significance. In the process, one should keep in mind the fact that underdevelopment and dependency are global, multidimensional phenomena calling for an integrated approach which takes into account the various aspects—trade, aid, foreign private investment and industrialisation—of economic dependence. Thus, while the present study focuses primarily on financial and monetary dependency, these other aspects should necessarily be included in a broader analysis which, obviously, cannot be conducted within the confines of this article.

Origins and institutionalisation of the Franc Zone system

The creation of the FZ dates back to the protectionist policies introduced by France in her colonial empire in the 1930s as a result of the economic recession. Similar autarchic considerations led to the strengthening of the FZ structure during World War II. As early as 1955, the FZ was characterised by a very centralised decisionmaking structure organised around four major principles: (1) free convertibility, at par, of the overseas and metropolitan currencies; (2) free movement of capital within the zone; (3) pooling of gold and foreign exchange reserves in a common Fund for Exchange Stabilisation; and (4) common rules and regulations for foreign commercial and financial transactions.⁷ These principles were, by and large, retained in the various agreements concluded between France

⁶ S Amin, 'Zone franc et développement', in S Amin, *Impérialisme et sous-développement en Afrique*, Paris: Anthropos, 1976, p 409 (author's translation from the French, as elsewhere in this article).

⁷ X de La Fourrière, *La zone franc*, Paris: Presses Universitaires de France, 1971, pp 13-14.

and her former African colonies as they successively became independent in the early 1960s.

To the extent that the devolution of political power from France to the newly sovereign African states was a peaceful process, the transition from colonialism to independence was usually smooth and did not entail a total break with the past or a radical transformation of the pre-existing economic arrangements and institutions. Thus, except for Guinea (which, on 1 March 1960, created its own currency and central bank), the other Francophone African states decided to remain within the existing monetary arrangement, subject to minor adjustments. Starting in August 1960, the Central African states concluded separately a number of cooperation agreements with France. The West African states, on their part, were engaged in similar negotiations which culminated in the conclusion, on 12 March 1962, of a formal treaty setting up a West African Monetary Union (usually referred to by its French acronym, UMOA: Union monétaire ouest-africaine).⁸ A new set of negotiations was initiated in 1972–3 as a result of which new monetary cooperation structures—constituting mere adjustments of the former arrangements—were set up. These were: (1) the monetary cooperation conventions of 22/23 November 1972 concluded between the Central African states and France, and (2) the 14 December 1973 Treaty concluded between France and the UMOA member states in West Africa.

It might be useful to view the FZ as a 'system'. According to a generally accepted definition of this concept, a system is 'a set of elements or units, which interact in some way and are set off from their environment by some kind of boundaries'.⁹ By the FZ system, we refer to a set of independent African states clustered around France. Such a system includes (1) France; (2) seven West African states member of UMOA (Benin, Burkina Faso, Ivory Coast, Mali, Niger, Senegal and Togo); (3) five Central African countries regrouped within the Bank of Central

⁸ Mali, which participated in the negotiation, finally opted out of this monetary union and created its own currency and central bank on 1 July 1962. Following serious financial difficulties, the Malian government signed on 15 February 1967 an agreement with the French government which stipulated the conditions of Mali's membership of UMOA, whereupon the Malian franc was devalued by 50 per cent. Finally, the act of agreement of 17 February 1984 (effective on 1 June 1984) marks the total reintegration of Mali within UMOA. Togo, which initially remained outside UMOA, eventually joined through the act of agreement of 27 November 1963, after the assassination of President Sylvanus Olympio. On the Malian case, see D L Crum, 'Mali and the UMOA', *Journal of Modern African Studies* 22 (3) 1984, pp 469–486; and F Kouadio, 'L'intégration du Mali dans l'UMOA', *Le Mois en Afrique* 19 (221–222) 1984, pp 76–100.

African states (Banque des Etats de l'Afrique centrale: BEAC) (Cameroon, Central African Republic, Chad, Congo and Gabon); and (4) the Federal Islamic Republic of Comoros which became a FZ member through the monetary cooperation agreement concluded with France on 23 November 1979. We deliberately exclude various systemic units which, strictly speaking, are outside the scope of the present study. These are (1) The French overseas districts and territories and Mayotte; (2) Mauritania and Madagascar, which withdrew from the FZ in 1973 and created their own currencies and central banks; and (3) Equatorial Guinea, which legally became BEAC's sixth member state only very recently, on 2 January 1985.

Table 1, which gives some basic indicators of these countries for 1982, provides a fairly accurate picture of the degree of inequality existing between France and her thirteen African partner countries. Thus, it is striking to note that France is practically as populous as these thirteen countries (54.3 million against 59.9 million inhabitants), that her GNP is almost twenty times higher than the cumulated GNP of these countries (\$627.2 billion against \$32.7 billion); and that her GNP per capita is fourteen times higher than the average GNP per capita of these countries (\$11.540 against \$813.8). Thus, while France and her African partners are legally equal, it is quite clear that they are greatly unequal in economic terms. Such economic inequality will, of necessity, have an impact on the distribution of power and influence with the FZ system, as the following sections will clearly demonstrate.

The structure of the Franc Zone system: legal and political consequences for the African member-states

Operational principles of the Franc Zone: the 'operations account' mechanism

1. *Operational principles of the Franc Zone* The monetary cooperation system set up by the 1960-62 and 1972-73 agreements is based on the same operational principles which were already in force in the late 1950s. The FZ operates according to four basic principles: (1) fixed parity between currencies (principle of equivalency of currencies) (2) freedom of internal transfers: transfers from one country to another are free and transfers from one currency to the other are unlimited (principles of freedom of transfers and unlimited transfers); (2)

harmonisation of exchange regulations of the member-states according to the French regulations for all external financial transactions (principle of exchange harmonisation); and (4) pooling of foreign exchange reserves of the FZ member states in the operations account (principle of common management of foreign exchange reserves). The UMOA Treaty as well as the monetary cooperation convention concluded between France and the Central African countries both recognise the 'CFA franc' (CFA F) as a single monetary unit issued by a common financial institution. This common monetary unit is issued solely by the Central Bank of West African States (Banque centrale des Etats de l'Afrique de l'Ouest: BCEAO) within UMOA, and by BEAC in Central Africa.¹⁰ Since the African states' independence, the value of the CFA F has remained fixed at 0.02 French Francs (FFs). In relation to the FF, the CFA F enjoys the benefits of equivalency of currencies, freedom of transfers, and unlimited transfers. The CFA F also enjoys the benefit of free convertibility with the FF through the operations account's mechanism.

2. The operations account mechanism and the free convertibility guarantee The operations account mechanism constitutes the cornerstone of the FZ system. This mechanism is regulated by specific legal instruments: the 13 March 1973 convention between France and the BEAC member states on the one hand; the 4 December 1973 convention between France and the UMOA member states on the other hand. According to these regulations, each of the two multinational central banks, BCEAO and BEAC, is allocated an operations account (OA) at the French treasury (*Trésor public français*: FT). The OA records as credits all the foreign exchange earned by each central bank outside its currency zone. Conversely, it records as debits each central bank's currency expenditures outside its currency zone. However, it is stipulated that the total amount of foreign exchange other than FF deposited in each central bank's OA should not exceed 35 per cent of their net foreign reserves (excluding their International Monetary Fund's/IMF gold tranche and Special Drawing Rights/SDRs). This means that in effect 65 per cent of the African central bank's (ACB) external reserves should be denominated in FF in order for the CFA F to benefit from the free convertibility guarantee. The OA must, as a

¹⁰ 'CFA franc' originally stood for 'Franc of the French colonies in Africa'. According to the 14 November 1973 Treaty, 'CFA' means 'African Financial Community' (*Communauté financière africaine*) in the UMOA states, since the 1972 reform, 'Financial cooperation in Central Africa' (*Coopération financière en Afrique centrale*) in the Central African states.

rule, remain positive, in which case it earns interest to the benefit of the central bank concerned.¹¹ As a matter of policy, the FT grants unlimited overdraft facilities on each OA, and this allows the member countries to draw FF without regard to the foreign exchange actually earned. Although there is a progressive interest rate charged by the FT on any net debit balances,¹² this rate is so low as to be considered 'non-dissuasive'. The CFA F is thus said to benefit from the free convertibility guarantee. However, elaborate legal paraphernalia (or 'safeguard clauses') are designed to make it extremely difficult for the OA actually to show a deficit. First of all, the safeguard clauses really start operating not when the foreign exchange reserves are totally depleted, but when they are equal or inferior to 20 per cent of deposit liabilities. Secondly, when the OA's reserves become depleted, the ACBs must draw on all possible sources of external reserves before resorting to the FT's financial assistance. Moreover, if the OA showed a debit throughout a ninety-day period, a series of drastic corrective measures should automatically be adopted. It is therefore not surprising that, until very recently, the balance of both the BCEAO and the BEAC accounts have constantly been positive.¹³

Thus, the so-called 'free convertibility guarantee' seems to be more hypothetical than real. For one thing, as Tchundjang Pouémi rightly points out, it is not a guarantee that France will automatically compensate for any foreign exchange 'gap' since, as we have just noted, the ACB's balances have practically always been positive.¹⁴ In addition, as Diarra cogently remarks, the principle of pooling of foreign exchange reserves results in an automatic compensation of the accounts of the debtor countries by those of the creditor countries. Consequently, the free convertibility guarantee would start operation only when all the member-states' accounts would collectively show a debit, an extremely unlikely occurrence under the existing circumstances. Furthermore, the guarantee should start operating not when the ACB's foreign exchange

¹¹ Originally, the FT's interest rate was equal to the (variable) discount rate of the *Banque de France*, with a minimum of 2.50 per cent a year. Since the 1973 reform, a new mode of calculation designed to harmonise earnings on deposits in the ACBs and in the FT has been adopted.

¹² The interest rate is 1 per cent for overdrafts amounting to 5 million FF, and 2 per cent for overdrafts amounting to between 5 and 10 million FF.

¹³ The only exceptions are the OA balances of the central bank of Mali and of BCEAO, which have been negative since 1967 and 1980, respectively. The central bank of Mali's position was 1.211 million FF in 1982, and that of BCEAO during that same year was 1,555 million FF (Comité monétaire de la Zone Franc/Comozof, *Rapport 1982*, p 187).

¹⁴ Tchundjang Pouémi, *op.cit.*, p 58.

reserves are equal or inferior to 20 per cent of deposit liabilities, but when they are totally depleted.¹⁵ Finally, it should be noted that the FT, as a non-monetary institution, is in an unusual position *vis-a-vis* the ACBs which are placed under its tutelage. Indeed, 'The OA cannot globally show a debit because the FT does not actually issue any currency'.¹⁶ In view of these facts, it is difficult to see how the staunchest advocates of the FZ can persist in justifying the so-called 'free convertibility guarantee' other than by resorting to mere semantic jugglery, as Bourdin does: 'It is not because it is not operational that the convertibility guarantee should be discarded, it is because it exists that it is not activated'.¹⁷

3. *The operations account: a critical evaluation* The major drawback of the OA mechanism is that it significantly limits the African member-states monetary—and thus economic—decisionmaking autonomy. Indeed, the French monetary guarantee is counterbalanced by a number of rules and regulations which seriously affect the African member-states' autonomy and sovereignty. Thus, the principle of common management of foreign exchange reserves allows France to 'keep an eye' on the member-states' foreign exchange reserves so as to 'ascertain that the requests made are based on a real need'.¹⁸ In addition, the French government actively participates in the management and control of the ACBs, and French officials often occupy key management positions within these institutions. Although a process of progressive 'Africanisation' of most decisionmaking positions within the ACBs was initiated in the early 1970s,¹⁹ the French administrators in these institutions still retain, by virtue of the unanimity rule which prevails in the main decisionmaking organs, a quasi-veto right.²⁰ Thus, as K Yansané rightly remarks, the progressive Africanisation of the ACB's key management positions has not significantly affected the balance of power within these institutions, which remains heavily biased in favour of the French government.²¹

¹⁶ Tchundjang Pouémi, *op. cit.*, p. 101.

¹⁷ Bourdin, *op. cit.*, p. 12.

¹⁸ Vinay, *op. cit.*, p. 18.

¹⁹ Out of BEAC's twelve Executive Council members, only three (ie a quarter) are French. The process of Africanisation has gone even further in UMOA, where the principle of equal representation of member-states prevails.

²⁰ H L Engberg, 'The Operations account system in French-speaking Africa', *Journal of Modern African Studies* 11 (4) 1983, pp. 540–1.

²¹ Yansané, *op. cit.*, p. 44.

One is led to wonder, as Diarra rightly does, whether the price paid by the FZ African member-states in terms of limitation to their sovereignty is not exceedingly high in view of the hypothetical free convertibility guarantee that they are supposed to benefit from in return.²²

Another major drawback of the OA system is that due to the equivalency of currencies principle, the fate of the CFA F is inextricably linked to that of the FF. In effect, the CFA F does not have any value in and of itself: it constitutes a mere appendage to the FF. As Amin remarks, one should not speak of a 'franc zone' but of a 'zone of the franc'.²³ Indeed, as Tchundjang Pouémi bluntly puts it, 'France is . . . the only country in the world which has succeeded in having its own currency—and only its currency—circulated in politically independent countries'.²⁴ A further consequence of the adoption of the equivalency of currencies principle is that any modification in the value of the FF *vis-à-vis* other foreign currencies automatically and fully affects the CFA F. When the FF is devalued, as was the case in August 1969 and after 1981, the CFA F is also devalued by the same percentage in order to maintain the fixed exchange rate. Similarly, when the FF floats, along with the other European currencies, against the dollar and the yen, the CFA F has to join the float.²⁵ In view of the uncertainties and negative economic consequences resulting from this situation, the African member-states have persistently asked for the right to introduce some flexibility in the CFA F/FF exchange rate, to no avail. Following the 1972–73 agreements, the French government merely agreed to make two minor concessions to the African governments on this issue: (1) contrary to the prevailing practice of the *sait accompli*, France would, in the future, 'consult' with the FZ member-states before any devaluation decision; and (2) in order to mitigate the potential negative impact of the FF devaluation on the African member states' economies, the ACBs' net balances would be indexed on the IMF's SDRs, according to some fairly esoteric method of calculation whose effectiveness has yet to be demonstrated.²⁶

Legal and political consequences of the Franc Zone system for the African member-states

1. *Franc Zone and unequal power.* Even the most superficial analysis of the FZ system reveals that while France benefits from exorbitant rights and privileges and wields considerable power, the African member-states are practically powerless, and their rights are almost non-existent. Thus, the principle of 'prior consultation' referred to above is considered as a mere 'act of courtesy' on the part of France towards her partner countries. Consequently, 'it could not possibly lead to the modification of a decision previously agreed upon and consistent with French economic and financial interests'.²⁷ It is therefore quite clear that the French government does not consider itself bound by the 'prior consultation' procedure, and unequivocally expresses its total freedom of decision and action in economic and financial matters. As to the African states' leeway, it is practically nil. Their only rights are those of the ultimate resort (non-membership or withdrawal), whatever the nature and significance of the difficulties encountered.²⁸ While the monetary cooperation agreements do provide for the possible modification of the CFA F/FF exchange rate, the French government has clearly cautioned the African states on the serious economic and political consequences of severing the monetary 'umbilical cord' which links them to France. In such times of doubt and 'dangerous' temptations, the African states are appropriately reminded of the Old Testament warning: 'He who breaks a hedge shall be bitten by a snake' (Ecclesiastes, 10.8.).²⁹

The acute imbalance between the rights and power of France on the one hand, and those of the African states on the other hand, results in a situation of extreme legal and political inequality. What is more, by shielding the African member-states against any monetary risks through the free convertibility guarantee, the FZ system puts these countries in a position of dependency which is not conducive to the normal assumption of their full monetary and financial responsibilities, to say the least.³⁰

One wonders whether the FZ advocates' insistence on the complexity of monetary mechanisms, the sophistication of monetary policy

Alibert, *op. cit.*, p 7.

Vinay, *op. cit.*, pp 137, 197.

Alibert, *op. cit.*, p 13.

On this point, see Diarra, *op. cit.*, pp 27-8; Tchundjang Pouémi, *op. cit.*, p 55; and Vinay, *op. cit.*, p 216.

instruments and the rigour and discipline required for a sound management of money and public finance is not a manifestation of these peoples' belief in the fundamental incapacity of Africans to manage their own economic, monetary and financial affairs. Is it not the expression of a latent racism based on the conviction that 'Since we left, the African countries are incapable of managing their own affairs'?³¹ Since France obviously continues to assume most of the monetary responsibilities in the FZ African member-states, one would be tempted to believe that this is indeed the case.

2. *Degrees of dependency: the 'concentric circles'.* While a global analysis shows that all FZ African member-states are legally and politically greatly dependent on France, a more detailed examination shows that there are, in fact, various degrees of dependency according to the criteria of 'proximity' to France. Four levels (or 'circles') may be distinguished according to this criteria. The first circle includes France and its immediate dependencies: overseas territories and districts, Monaco. The second circle is made up of the Central African states, members of BEAC linked to the FT by an OA convention. A quick comparison with UMOA shows that BEAC's status is much less liberal and autonomous than that of the West African UMOA states. For one thing, contrary to their West African counterpart, the Central African states have not yet set up a full-fledged monetary union. Furthermore, the monetary cooperation mechanisms instituted within BEAC are less elaborate and sophisticated than those existing within UMOA.³² The third circle is constituted by the UMOA member-states which, as we have just mentioned, enjoy a greater degree of autonomy from France than their Central African counterpart. A fourth circle includes the Francophone North African countries (Algeria, Morocco and Tunisia). Since their accession to independence, these countries have created their own currencies and central banks, and are therefore conducting an autonomous financial and monetary policy. The only formal

³¹ G Martin, 'Les fondements historiques, économiques et politiques de la politique africaine de la France', *Genève-Afrique* 21 (2) 1983, pp 41-2, 46. For an English, revised and updated version, see G Martin, 'The historical, economic, and political basis of France's African policy', *Journal of Modern African Studies* 23 (2) 1985.

³² Two facts might help illustrate this point. First, whereas BCEAO's Executive Council is structured on a parity basis (twelve members, two for each state), that of BEAC has an unequal composition (twelve members: four for Cameroon, three for France, two for Gabon and one each for the other states). Secondly, whereas a financial market has been created within the framework of UMOA on 1 July 1975, no such market has yet been organized within the BEAC zone.

institutional links remaining between the North African countries and France are the 'special drawing accounts' (*comptes d'avances*) which their central banks still retain at the French central bank, Banque de France (BDF), and which provides them with short-term, limited monetary assistance.

Figure 1 graphically represents these four concentric circles. A main criterion of French 'interventionism' in the African countries' economies is the state of these countries' economies: the weaker and less healthy the economy, the greater the degree of French intervention in monetary and financial management. Another criterion is the proximity to the implicit model represented by the French economy, according to the various levels of development of the other FZ countries. In this perspective, North Africa, UMOA, BEAC, and dependencies represent different stages of development, from the highest to the lowest, in relation to the French model which they tend to emulate. Ultimately, the degree of financial and monetary autonomy is a function of the level of development, which itself conditions the state

Figure 1: The Franc Zone's four concentric circles

of the economy. It is important to note that this process of progressive autonomy (or independence) is strictly and exclusively controlled by the central unit (or metropole) of the system, ie France. In this regard, it is quite clear that no radical transformation of the structure of economic cooperation between France and her former African colonies has actually taken place since independence.³³

The functioning of the Franc Zone system: sectoral economic consequences for the African member-states

In their prolific writings, the FZ panegyrists insist *ad nauseam* on the numerous advantages that the African member-states are supposed to derive from the free convertibility guarantee attached to the OA's mechanism.³⁴ Prominent among these so-called 'advantages' are the stability and security conferred to the CFA F by the French convertibility guarantee, which exonerates the African beneficiary states from any balance-of-payments and foreign exchange difficulties. Other assumed 'advantages' include the favourable climate for foreign private investment and public capital flows created by the French convertibility guarantee, which positively contribute to the economic growth and development of the African member states. Finally, the FZ is said to constitute a powerful incentive for solidarity, cooperation and regional integration among the African member-states themselves. The 'success' of the FZ is demonstrated as much by the number of candidate countries it has recently attracted (Equatorial Guinea, The Gambia, Ghana, Sierra Leone and Zaïre) as by the economic failure of those states which initially refused to join it (Guinea and Mali).

A comprehensive study addressing each of these points would be necessary to assess adequately the real substance of the 'advantages' attached to the free convertibility guarantee. As this is obviously not possible within the confines of the present article, we shall limit ourselves to a brief survey of some of the main sectoral (rather than global) economic consequences of the FZ system for the African member-states. In this perspective, devaluation and inflation, and savings and credit policies will successively be examined.

³³ See in particular Bourgi, *op. cit.*, p 155; Diarra, *op. cit.*, p 21; and Martin, 'Les fondements, *op. cit.*, pp 49-56.

³⁴ See the previously quoted works by Alibert, Bourdin, de La Fournière and Vinay.

Cumulative impact of devaluation and inflation on the African states' economies

We noted above that by virtue of the equivalency of currencies principle, any modification in the value of the FF *vis-à-vis* other foreign currencies automatically and fully affects the CFA F. Thus, in order to maintain the fixed exchange rate, the CFA F has been devalued by the same percentage as the FF each time the latter was devalued *vis-à-vis* other foreign currencies. This was notably the case in August 1969 (12.5 per cent), October 1981 (3 per cent), June 1982 (5.57 per cent), and in March 1983 (2.5 per cent). These successive devaluations, added to the steady increase of the US dollar on world monetary markets since 1980, have had a devastating impact on the economies of the African states concerned.

In the first place, the devaluation's immediate result is automatically to reduce the value of the foreign exchange reserves held by the ACBs in the FT. These sums are all the more significant since in fact these banks hold most of their assets in FF, well beyond the 65 per cent statutory minimum.³⁵ Furthermore, as previously noted, the ACB's net balance *vis-à-vis* the FT has always been positive, by an average of 50 billion CFA F from independence to 1974. From 1974 to 1976, this position increased from 50 to 75 billion CFA F.³⁶ Table 2 clearly shows the significant improvement in the BEAC countries' position (from 126.6 billion CFA F in 1981 to 161.9 billion in 1982 and 191.3 billion in 1983). At the same time, the BCEAO's position began to deteriorate, decreasing from 127.3 billion CFA F in 1978 to 54.6 billion in 1979 and becoming significantly negative starting in 1980 (from -52.6 billion in 1980 to -200.4 billion in 1983).

Table 2: Evolution of the BCEAO operation account's balances, 1978-83 (millions of CFA francs)

	1978	1979	1980	1981	1982	1983
BCEAO	127,350 21,273	54,637 41,390	-52,650 93,573	-85,820 126,637	-80,972 161,908	-200,446 191,375

Source: Comozof, *Rapports 1978, 1979, 1980, 1981, 1982 and 1983*, various Annexes

³⁵ Thus, BCEAO held about 78 per cent of its foreign exchange reserves in FF in 1978-79. In the case of BEAC, this proportion varied between 90 and 95 per cent from 1979 to 1982 (Comozof, *Rapports 1978 to 1982*).

³⁶ Tchoundjang Pouémi, *op. cit.*, p 58.

It should be stressed that these assets have been rather poorly remunerated. Thus from 1960 to 1973, the interest rate granted by the FT on deposits was similar to that posted by the BDF, which was the lowest on the French monetary market. The 1973 agreements have attempted to reduce somewhat the gap between the interest rates granted to the ACBs by the FT and those of the French monetary market, with at best mitigated results. If one adds to this the fact that the interest rates posted by the other financial markets (including the Treasury Bills that the BDF underwrites with her own reserves) were, during that period, significantly higher than those of the French monetary market (by about 4 to 5 per cent), one can safely estimate the net loss suffered therefrom by the African states member of the FZ during the first twenty years of independence at 80 billion CFA F.³⁷ In the particular case of the FF devaluation, (by 12.5 per cent) of August 1969, the net loss to the UMOA countries of that devaluation in relation to gold and to other foreign currencies has been estimated at 4.3 billion CFA F.³⁸

Furthermore, it should be noted that the FF has been steadily devalued *vis-à-vis* other foreign currencies since 1980. Thus, the devaluation *vis-à-vis* the US dollar was of 12.3 per cent in 1980, 21 per cent in 1981, 15 per cent in 1982, and 15.8 per cent in 1983.³⁹ This gives an idea of the significant gains that the ACBs might have realised, had they held most of their reserves in US dollars during that period. In view of this situation, one is dumbfounded by the astounding statements made by some of the unconditional advocates of the FZ to the effect that the foreign exchange reserves of the African member states have been better remunerated under the present arrangement than would have been the case had these states held most of their foreign exchange reserves in gold⁴⁰ or in other foreign currencies, particularly in US dollars.⁴¹ If this was the case, one wonders why Cameroon would take such pains to hold more than half of its foreign exchange earnings derived from oil revenues in US dollars in American banks, both in Cameroon and in the US. According to the most conservative estimates, Cameroon's oil revenues (which are deposited in a special, extra-budgetary account) were in 1981-2 valued at \$1 billion, with a

⁴⁰ de La Fournière, *op. cit.*, p. 70.

⁴¹ Bourdin, *op. cit.*, p. 59; Vinay, *op. cit.*, pp. 171-3.

production amounting to about 5.3 millions tons. This in effect means that close to \$500 million (or more than 200 billion CFA F) actually escape the regular FZ channels, much to the dismay and irritation of the French government. It is generally estimated that the interest earned on these deposits alone largely compensates for any nominal deficit of Cameroon's balance of payments.⁴²

In the area of trade, the progressive devaluation of the FF has a negative impact on the FZ African countries to the extent that it results in an increase of import costs from third countries, particularly of oil imports denominated in US dollars. Such a negative impact is all the greater since there has been a steady increase of the share of third (non-FZ) countries in the global trade of African FZ countries, and a proportional relative decline of France's share in that trade. Thus, the proportion of non-FZ imports has been 73 per cent (1977) and 72 per cent (1979) for Benin, 72 per cent (1980) for Togo, 66 per cent (1982) for the Ivory Coast, and 66 per cent (1981) for Senegal.⁴³

Another negative effect of devaluation is to increase the amount of annuities—both in terms of capital and interest—on the foreign debt of the African countries denominated in foreign currencies. The more these countries are indebted to strong currency countries, the greater the additional amounts due. Thus, according to the Hudson Institute, 80 to 90 per cent of the LDCs' foreign debts are denominated in US dollars. Other sources estimate that devaluations account for 60 to 70 per cent of the present external indebtedness of the FZ countries.⁴⁴ Tremblay has calculated that the August 1969 devaluation of the FF has increased the annuities on the UMOA countries' foreign debt by about 414 million CFA F.⁴⁵ Countless examples could be cited to demonstrate the negative impact of the devaluation of the FF on the indebtedness of the FZ African member-states.⁴⁶

⁴² *Africa Confidential* 24 (16), 3 August 1983. This issue is said to have been one of the main points of contention raised by the French delegation during President François Mitterrand's state visit to Cameroon on 20–21 June 1983.

⁴³ Comozof, *Rapport* 1983, pp 285, 288, 297 and 300.

⁴⁴ T M., 'Dévaluation et alourdissement de l'endettement des pays de la zone franc', *La Voix du Kamerun en Exil* (36) 1983, p 13.

⁴⁵ Tremblay, 'La dévaluation', *op. cit.*, p 264

⁴⁶ Taking Cameroon as a case in point, one author has demonstrated the negative impact of the devaluation of the French franc on the indebtedness of that country. According to this author, Cameroon's external debt amounted to \$2,487 million in 1980. On the basis of the then prevailing exchange rate (1 \$ = 4.55 FF), Cameroon needed 11.32 billion FF (or 565.80 billion CFA francs) to pay up its debt. In January 1983, as a result of the intervening FF devaluation (1 \$ = 7.43 FF), Cameroon owed 18.48 billion FF (or 932.92 billion CFA F). Thus the same debt had increased from 565.80 billion CFA F to 923.92 billion between 1980 and 1983 (which represents an increase of 358.12 billion CFA F) (T M., *op. cit.*, p 14)

In addition, devaluations tend, through various indirect mechanisms, to increase the overall price level in the African FZ states. Initially, those countries are already disadvantaged by the fact that the basic monetary unit commonly used is not the CFA franc—which is merely a unit of account—but coins with a face value of five, ten or twenty-five CFA F. This means that prices are necessarily increased by multiples of five CFA F, which contributes to the overall price increase and inflationary tendencies in the African FZ states.⁴⁷ One of the major immediate effects of inflation is that known as 'time-lag'. This refers to the fact that a period of time elapses between the moment when the devaluation decision is taken and the time when the real impact of this decision is felt. Thus, the oligopolistic firms operating in the African countries increase their prices, by anticipation, as soon as the devaluation decision is known. They then increase their prices a second time when the impact of the extra costs due to inflation are actually felt. This phenomenon explains why in these countries an expected price increase of, say 8 per cent usually ends up as a real price increase of over 15 per cent.⁴⁸

A further negative economic consequence is the mechanism whereby French inflation is transferred to the FZ African countries through trade links and capital transfer. Although it is true (as noted above) that the African states have progressively diversified their foreign trade partners, France remains, by and large, the main trading partner of those countries. Table 3 shows that while the African states' exports to France are decreasing overall (except in the cases of Niger, Central African Republic and Comoros, where they exceed 40 per cent), these states' imports from France remain significant (between 40 and 60 per cent), notably in the cases of Niger, Cameroon, Central African Republic and Congo. Thus, the high rates of inflation that have prevailed in France over the past years (13.6 per cent in 1980, 14 per cent in 1981, 9.7 per cent in 1982, and 9.3 per cent in 1983) have had a negative impact on the FZ African economies, which remain largely influenced by the French economy. For one thing, the price of imported goods increases. In addition, this increase in the price of imported goods—which are essentially consumed by the national bourgeoisie and expatriates—indirectly affects the level of local prices in the African

countries, which tend to increase as a result. In this fashion, French inflation is, literally, imported into the FZ African countries.⁴⁹ In the final analysis—and contrary to some dubious assertions⁵⁰—the pooling of foreign exchange reserves through the OA's mechanism seems to be much more beneficial to France than to the African states concerned. As previously noted, the ACBs' OAs at the FT have constantly been positive. There is no doubt that the FT uses these assets to offset any deficit that might occur in the French public accounts.⁵¹ Furthermore, the African states have constantly been among the main foreign exchange earners within the FZ via the OA mechanism. Thus, in 1966 they provided 99 per cent of the FZ's foreign exchange.⁵² Finally, Table 4 reveals that while France's balance of payments (particularly with other developed countries) has been in chronic deficit since 1980 (-71.2 billion FF in 1981, -46.1 billion in 1982, and -3.8 billion in 1983), this balance has always (except in 1981) been positive with other FZ countries (+1.9 billion FF in 1980, +2.8 billion in 1982, and +76 million in 1983). It is thus quite clear that the FZ's overall positive foreign exchange reserves significantly contribute to offset France's chronic deficit of its balance of payments, which otherwise would be much worse.

If it can truly be said of the FZ that it is a 'solidarity zone',⁵³ it must be acknowledged that it is, unfortunately, a one-way solidarity. Indeed, the fact that the OAs are opened at the FT, and not at the BDF (as they

⁴⁹ The rate of inflation prevailing in certain Francophone African countries is quite impressive. In the Ivory Coast, for instance, this rate was 16.3 per cent in 1974, 18.9 per cent in 1975 and 19.5 per cent in 1978. In Senegal, it was 19.4 per cent in 1974 and 21.4 per cent in 1975 (Guillaumont, *op. cit.*, pp 156-7).

should) in effect insulates the French economy from fluctuations arising within the FZ states, while these states are actually subjected to the full impact of fluctuations arising in the French economy. The latter benefits on two accounts: while it is protected from disturbances arising within the FZ states, it benefits substantially from the significant foreign exchange reserves held by these states in the OA. As for the African states, they are double losers: first, because of the negative impact of imported inflation on their economies, which are largely influenced by France; secondly, because of their net losses arising from the fact that they are compelled to hold most of their foreign exchange reserves in a constantly depreciated currency. Ultimately, it would seem that the African states have struck a bad deal in which France is the major beneficiary and they are the net losers. The study of saving and credit policies in the FZ cannot but reinforce this pessimistic conclusion.

Savings and credit policies in the Franc Zone African member-states

General principles Generally, savings and credit policies are the main economic instruments through which the state attempts to allocate internal capital resources according to sectoral priorities as defined in the global development strategy. Yet, surprisingly, such policies are highly orthodox, conservative and centralised in the FZ African member-states. First of all, while it is generally admitted that savings and credit policies should necessarily be initiated and controlled by the state, one finds that in the FZ African states these policies are actually carried out by the ACBs, which are themselves placed under the authority of the FT. This means that it is in fact the BDF (as the FT's controlling authority) which ultimately controls savings and credit policies in the FZ. Secondly, such policies, as conducted in that zone, are clearly influenced by the most orthodox neo-classical conception of development. According to this view, the low level of economic development and the weak financial infrastructure of the African states call for specific types of monetary and credit policies. The same school of thought holds that in the LDCs, credit allocation has a direct impact on external reserves. In these countries, therefore (so the argument goes), the level of external reserves determines the necessary level of credit allocation. This, in the FZ African states, the ACBs are invested with the exclusive right to determine the 'reasonable needs' of the member-states' economies which can be satisfied 'without actually

upsetting the external balance'.⁵⁴ Consequently, in these states, the ACB's allocations to the national treasuries are limited by specific ceilings (20 per cent of ordinary budgetary receipts in BEAC, and 20 per cent of national fiscal revenues in BCEAO). Such a practice is supposedly designed to 'moderate the states' excesses'.⁵⁵ It is quite clear that the observance of these ceilings is a tacit condition of the French external convertibility guarantee.⁵⁶ France is thus invested with the responsibility of supervising the compliance with orthodox financial and monetary regulations. Such a collective discipline as is enforced within the FZ is seen as constituting 'a safeguard against individual excesses'.⁵⁷

While it is generally admitted that one of the bank's functions is to finance the national treasury, thus making the government indebted to the banking system, one finds that the ACBs generally run a credit *vis-à-vis* the African governments.⁵⁸ This is all the more surprising since the pressing economic needs of these LDCs call for a radically different situation. Thus in the FZ countries one is faced with a most unusual situation in which the treasuries of supposedly independent states are not in a position to mobilise financial resources by resorting to monetary mechanisms commonly used elsewhere. Furthermore, the central bank's policies are determined not by the member-states' economic needs but by their level of foreign reserves. This results in the conservative management of these states' foreign reserves. Ultimately, one must admit that the exceedingly strict monetary and financial discipline imposed on the FZ African member-states is unique in the world.⁵⁹ As Fabra rightly observes: 'One is easily orthodox when it comes to poor countries'.⁶⁰ This observation is borne out by the study of the actual implementation of savings and credit policies.

2. Implementation The main method of quantitative credit control

⁵⁴ Vinay, *op. cit.*, p. 104. According to the same author, 'The borderline between reasonable and unjustified needs is not neatly drawn. It can vary with circumstances . . . and according to the countries and economic structures' (*ibid.*, p. 104).

⁵⁵ *ibid.*, p. 189.

⁵⁶ *ibid.*, p. 196.

⁵⁷ *ibid.*, p. 192.

⁵⁸ In UMOA, the government's net position *vis-à-vis* the monetary institutions moved from creditor (by 29.6 billion FF) in 1980 to debtor (by 122.4 billion in 1981, 218.4 billion FF in 1982, and 345.8 billion in 1983) (Comozof, *Rapports 1982*, p. 149; 1983, p. 142).

⁵⁹ M Rudloff (in Yansané, *op. cit.*, p. 46) has this to say in this regard:

The imposition of reduced credit ceilings is a measure which the developed countries adopt only reluctantly. Such a measure can be catastrophic in underdeveloped countries. One wonders to what extent the present economic stagnation that prevails in many FZ member states is not due to the imposition of such constraining and rigid financial measures.

⁶⁰ P Fabra, 'Zone franc ou zone de pauvreté?', *Le Monde* (Paris), 2 December 1972.

used in the UMOA and BEAC member-states is that of the banking system's refinancing through the central bank, rather than the resort to the discount rate. Thus, interest rates in these states have been deliberately stabilised at a fairly low level, although they have been progressively increased since 1974.⁶¹ As a result of the freedom of transfers and unlimited transfers principles prevailing within the FZ, this policy of low interest rates has inevitably resulted in a significant capital flight from the African countries towards France, where the interest rates are much higher.⁶² Thus the main purpose of this policy, which was to facilitate and encourage private national and foreign investment, has clearly been defeated. Ultimately, there is no doubt that savings in the FZ African states are discouraged by the continuing low interest rates policy. Thus, Table 5 shows that within UMOA, the nominal interest rates on savings accounts have increased from 3.25 per cent in 1970-72 to 4.75 per cent in 1973-74, 5.50 per cent in 1976-79, 7.50 per cent in 1980-81 and 9.50 per cent in 1982. The same table shows that during that period, the minimum real interest rates on savings accounts (taking the rate of inflation into account) were constantly negative (- 15.90 per cent in 1975, - 14 per cent in 1978, and - 11.60 per cent in 1979). This situation being, by and large, the same in the BEAC countries, its logical consequence is for savings to move to more remunerative markets, notably to France.⁶³

The selective control of credit aims at regulating credit allocation so that it can be directed to those sectors considered as priorities within the national development strategy. Credit allocation is usually the responsibility of the commercial banks. Table 6 shows that over half of all the banks operating in the FZ African countries are foreign-owned in the proportion of 70 per cent. While these co-exist alongside a significant state sector, only about 8 per cent of the total number of banks identified in those countries are owned by private nationals on a

⁶¹ Thus from 1962 to 1974, the BCEAO's discount rate has remained fixed at 3.50 per cent, and that of BEAC never exceeded 4.25 per cent. However, the BCEAO's discount rate was progressively raised from 5.50 per cent in January 1973 to 8 per cent in July 1975 and 10.50 per cent in April 1980. Similarly, that of BEAC increased from 5.50 per cent in 1974 to 6.50 per cent in January 1976, 8.50 per cent in October 1979, and 9 per cent in December 1982 (Comozof *Rapports* 1978, p 389; 1982, p 408).

⁶² This capital flight has not been noticeably reduced even after the increase in the ACB's interest rates which took place since 1973/74. These rates still remained significantly lower than those prevailing in France 16.81 per cent in April 1982, 12.88 per cent at the end of 1982, and 12.27 per cent at the end of 1983) (Comozof, *Rapports* 1982, p 124; 1983, p 120).

⁶³ Thus during 1980, the rate of one-month Eurodollar deposits increased from 9 to 23 per cent, and the basic rate in the US increased from 10.75 to 21.50 per cent. In France, the basic rate decreased from 14 to 12.75 per cent between the beginning and the end of 1982.

majority basis. Indeed, 'in Africa, the banking profession is a foreign preserve. There are no genuinely African banks . . . Blacks are practically excluded from the banking profession'.⁶⁴ While there is no doubt that control of financial capital is a necessary prerequisite of a genuinely Africanised banking system, such control at present largely eludes the African public and private sectors.⁶⁵

The African countries' capital needs are determined by their development strategy. Whatever that strategy might be, it initially requires vast amounts of capital for investment in basic transport, communications and social infrastructure. This necessarily calls for long-term financial loans on concessional terms. On the other hand, the commercial banks operate according to market principles and are essentially concerned with making the highest profits in the shortest possible time. Consequently, they will be interested in financing only business ventures with a sufficiently broad and sound financial basis which offer the best prospects for assured and immediate gains. These obviously incompatible strategies of development of the African states and the private banking sector can only be reconciled and accommodated within a global state-controlled credit policy in which the state would be in a position to direct credit to the priority areas. However, in the FZ African states, it is in fact the central banks who actually control the credit policy. It is therefore these central banks, and not the states themselves, which have the responsibility of allocating credits among the different sectors of the economy. Consequently, it should not come as a surprise that in the FZ, the banking sector tends to favour short-term credit, to the detriment of medium- and long-term credit.⁶⁶

It is thus obvious that the credit policy conducted within the FZ is essentially determined by strictly mercantilist considerations. Furthermore, such a policy retains a purely colonial character, to the extent that it predominantly favours those sectors which are still heavily dominated by foreign (mostly French) capital, namely commodities, small-scale, import-substitution industry and wholesale and retail trade. Thus, this particular credit policy tends to favour export-oriented

⁶⁴ Tchundjang Pouémi, *op. cit.*, p 73.

⁶⁵ Yansané, *op. cit.*, p 164.

⁶⁶ Thus, within BEAC, the proportion of short-term credit in relation to total credit allocation was 67.5 per cent in 1981, 70.2 per cent in 1982, and 69.9 per cent in 1983. For medium-term credit, this proportion was 29.1 per cent in 1981, 26.8 per cent in 1982, and 27.7 per cent in 1983. For long-term credit, the same proportion was 3.4 per cent in 1981, 3 per cent in 1982, and 2.4 per cent in 1983 (Comozof, *Rapports 1981*, pp 152-3; 1982, pp. 156-7; 1983, pp 148-50).

foreign firms to the detriment of nationally owned businesses. Furthermore, by favouring short- and medium-term—as opposed to long-term—credit, the FZ banking system does not allow the African states (and entrepreneurs) to have access to the necessary investment capital. These states are thus compelled to resort to bilateral and multilateral ODA in order to finance their development programmes and projects. This is all the more unusual since, as we have seen above, the ACBs generally run a credit *vis-à-vis* the banking system. If one adds to this the fact that the ACBs' OAs have almost always been positive, one can safely conclude that the African FZ states do have an important credit potential which is actually untapped or wasted.

In the final analysis, the FZ constitutes a single preferential economic area within which France can freely pursue a purely neo-colonial policy of economic exploitation of the African countries. It is thus necessary to analyse the FZ globally, rather than sectorally, if one is to assess fully and accurately its impact on the African economies concerned.⁶⁷ Unfortunately, it is not possible to deal with the other aspects of economic cooperation within the limits of the present article. While this issue has been dealt with elsewhere, it certainly deserves further, more detailed study.⁶⁸

Conclusion: Franc Zone, underdevelopment and dependency and strategies of monetary liberation

Franc Zone, underdevelopment and dependency

The analysis of the legal, political and economic consequences of the FZ system for the African member-states has revealed a number of objective realities. First of all, it appears that behind the façade of a purely formal legal equality, there exists in fact a situation of extreme inequality between France and her African partners. Through the FZ mechanism, the latter have actually delegated all their monetary and financial responsibilities to France in what amounts to a voluntary surrender of sovereignty. It is France which is actually entrusted with the power of decision, management and control of the economic policies of the African states. Secondly, the OA mechanism institutes a

⁶⁷ Guillaumont, 'Zone franc et développement: les caractéristiques de la zone franc sont-elles dissociables?' in R Tremblay (ed), *Afrique et intégration monétaire*, Montréal: Les Editions HRW, 1972, pp 289–350.

⁶⁸ See in particular, P Hugon, 'L'Afrique noire francophone: l'enjeu économique pour la France', *Politique africaine* (5) Février 1982, pp 75–94; G Martin, *op. cit.*, pp 49–56.

purely hypothetical convertibility guarantee to the extent that such a guarantee has never actually been put to the test. This mechanism in effect tightly links the CFA franc to the French franc, with the result that the latter's chronic difficulties are automatically transmitted to the former. Under the cumulative impact of the French franc's repeated devaluations and imported inflation, the economic situation of the African FZ states has steadily and significantly deteriorated since independence. It has now become quite clear that the pooling of foreign exchange reserves institutionalised through the OA mechanism is much more beneficial to France than to the African states concerned. The latter seem to have concluded with the former a bad deal in which France has much to gain, and the African states much to lose. Furthermore, these states have at best very limited control over savings and credit policies. In the FZ system, these policies are initiated, regulated and directed by the ACBs, and they are implemented by the commercial banks. In addition, the credit policy which is carried out is strictly orthodox and ultra-conservative, resulting in an extremely cautious and profit-oriented management of assets. Short- and medium-term credit are given precedence over long-term credit, with the resulting consequence that safe and profitable ventures (and foreign firms) are privileged to the expense of much-needed investments in economic and social infrastructure (and local entrepreneurs).

In sum—and from the point of view of the African states concerned—the FZ system seems to be grossly iniquitous legally and politically, and totally irrational economically. Indeed, through the OA mechanism, the African member-states are forced to accumulate foreign reserves abroad, prevented from running budgetary deficits at home while they are at the same time compelled to resort to foreign private and public capital in order to finance their long-term investment needs. Thus, the African states are paradoxically forced into a situation of indebtedness *vis-à-vis* developed countries (notably France), whereas a rational and strict management of their internal and external reserves should allow them greatly to reduce their dependency on foreign aid and foreign private capital.⁶⁹ As a consequence of this peculiar situation, the

⁶⁹ This situation is not unlike that which prevailed during the colonial era, thus described by Rocheteau:

The colonial banks constituted a remarkable channel for the transfer of local savings to the metropole in the form of short-term, low-cost credit. Conversely, because of this export of local savings, colonial investment could only be financed by resorting to capital import from the metropole on a long-term, high-cost basis.

(G Rocheteau, *Pouvoir financier et indépendance économique en Afrique*, Paris: Karthala, 1982, p 30).

African states increase their dependence on external sources of financing while they are not in a position actually to direct the incoming financial flows to the priority areas in their development plans. Ultimately, the FZ system contributes, in typical neo-colonial fashion, to perpetuate and increase the underdevelopment and dependency of the African states while at the same time significantly helping France to develop. Any study of the much-deplored 'poverty' and 'impoverishment' of the African countries and populations should be viewed against this background. At this point, it is necessary to examine the various possible alternatives offered by a global strategy of monetary liberation.

What is to be done? Alternative strategies of monetary liberation

We hold it to be self-evident that monetary independence is not only desirable, but also possible. In this perspective, one need not be unduly influenced by the prophets of doom who strongly and persistently warn the African countries against the pitfalls of monetary independence. In support of their warning, these authors generally refer to the well-known and serious economic and financial difficulties of such countries as Guinea, Madagascar and Mali. Such arguments may be countered by observing, as Diarra has done, that the failure of these socialist countries' experiments in monetary independence are due not so much to their relative 'poverty' or to deficiencies inherent in their national currencies, but rather to economic and financial mismanagement on the part of their governments and monetary institutions.⁷⁰

Among the various proposed reforms of the FZ system, one should make a distinction between (1) the reformist alternatives, which aim simply at introducing minor adjustments, leaving the overall mechanism intact, and (2) the revolutionary alternatives, which propose that the existing system be entirely overhauled. These will be successively examined.

A number of authors are of the opinion that given their present level of development, the African states must necessarily maintain their monetary cooperation with France. As a result, their various reform proposals hinge around a readjustment of the system that would introduce a greater degree of autonomy in the African states' management of their own monetary affairs. Such proposals envisage the

⁷⁰ Diarra, *op. cit.*, pp 39-55.

creation of national currencies and national central banks entrusted with the issuing of currency and the allocation and control of credit. In this framework, the link between the FF and the CFA F would be maintained. However, the CFA F would be confined to the role of a unit of account, reserve currency and intermediary for external monetary transactions. Within each sub-region (West and Central Africa), an African monetary union, or African Monetary Fund (AMF) would be created. The unlimited convertibility guarantee provided by the FF to the CFA F would be maintained. This would be done either by establishing a formal link between the AMF and the FF via an OA, or by the opening at the FF of 'special drawing accounts' for the AMF. Such a system would undoubtedly introduce a greater degree of autonomy within the system, the African states becoming exclusively responsible for the implementation of national monetary policies. Nevertheless, this system would preserve inter-African and Franco-African monetary cooperation.⁷¹

Other reform proposals, derived from Kwame Nkrumah's pan-Africanist blueprint, advocate a progressive continental monetary integration as part of a larger economic and political integration process at the continental level. The constituent elements of such a progressive continental monetary integration would be the following: (1) an African payments and clearing union; (2) an African monetary zone; and (3) an African central bank. Such a system implies the pooling and common management of foreign exchange reserves, as well as the creation of a single African currency.⁷² It is interesting to note in this regard that the 1980 Lagos Plan of Action calls for the creation of a sub-regional multilateral clearing and payment arrangement no later than the end of 1984, and of an African Payments Union before the end of the decade.⁷³

Looking at the issue from a gradualist and realist perspective, one might be tempted to advocate the reformist option of structural

⁷¹ Leading proponents of this option are: M Diarra, *op. cit.*, pp 61–8; F Kouadio, 'L'intégration du Mali dans l'UMOA', *op. cit.*, pp 97–8; C A Michalet, 'L'intégration monétaire: l'exemple de la zone franc in *Le défi du développement indépendant* by C A Michalet, Paris: Les Editions Rochevignes, 1983, pp 134–8; J Nkuete, *Le franc CFA face aux mutations des grandes unités de compte*, Yaoundé: Editions CLE, 1981, pp 148–62; and A Y Yansané, 'Some problems of monetary dependency in French-speaking West African states', *Journal of African Studies* 5 (4) 1978/79, pp 469–70.

⁷² Nkrumah's monetary pan-Africanist blueprint is outlined in K Nkrumah, *Africa Must Unite*, New York: International Publishers, 1963, pp 163, 219; other advocates of this view include: A Mensah, 'Monetary relations among African countries', *Africa Development* 4 (1) 1979, pp 14–18; and Tchundjang Pouémi, *op. cit.*, pp 230–45.

⁷³ Organisation of African Unity, *Lagos Plan of Action for the economic development of Africa, 1980–2000*, 1981, p 88.

adjustments within the FZ. At this point, however, our concern is not so much with what is immediately practicable as with what is ultimately desirable. From this perspective, we clearly favour the revolutionary blueprint. Indeed, we are of the opinion that in view of the serious negative political and economic consequences of the FZ system on the African states concerned, this system must necessarily be overhauled. The new system should be inspired from the pan-Africanist blueprint outlined above, and should aim at the total economic and political integration of the African continent. Whatever the technical, economic and political constraints and difficulties that its actual implementation might face, we are firmly convinced that the setting up of such a system constitutes a necessary prerequisite to the genuine and complete economic independence of the African states.

Development and dependency in the Dominican Republic

The Dominican Republic is a rich country populated by poor people. The national territory is blessed with a variety of mineral resources, with fertile soils, with plentiful fish and fowl and forests, and with an equable climate; but its people, ingenious and industrious though they be, have benefited little from nature's bounty.

Although the country ceased to be held formally as a colony in the nineteenth century, it has been, along with most other Caribbean states, economically appended and politically subordinated to some external power throughout its history. Since the turn of the century, the relevant external power has been the United States. The nature of the republic's dependence has meant that the most important decisions as to what would be produced, at what level of production, with what technology and mix of capital- or labour-intensity, and how and where major products would be marketed would be made beyond its borders and without reference to the needs of its people.

Consequently, the nation's economy, as it has evolved, is unbalanced and fragile. Although impressive advances have been made in the last two decades in industrialisation and economic diversification, and some sectors—mining, manufacturing, tourism, and banking, for example—have become highly modern, the country remains heavily reliant on markets and prices it cannot control, on loans it cannot repay, and, increasingly, on imported food it cannot afford. Meanwhile, though emigration to more prosperous areas, particularly Puerto Rico and the United States mainland, has provided some relief for the now chronic problems of unemployment and underemployment, the ranks of the unemployed continue to be swelled by illegal immigration from even less fortunate Haiti.

The republic has experienced spurts of economic growth. But few Dominicans would equate such growth, as measured in GNP or per capita income, with the sort of development that remains a broadly shared popular goal. Such a concept of development embraces equity as well as accumulation, choices and opportunity as well as occupation and sustenance, a sense of individual worth and dignity as well as national

pride, and some degree of control over personal and national destinies.

Having suffered for so long from the lack of genuinely domestic and popular political institutions, many Dominican leaders had come to believe that with fraud-free elections and majority rule they would be able to move from economic dependence to interdependence and to begin to satisfy the basic needs of the population for nutrition, shelter, health care, education, and jobs. But the economy's downward spiral since the reintroduction of constitutional rule in 1978 has dashed those hopes. The predominantly urban, labour-based Dominican Revolutionary Party (PRD) has failed miserably in its attempts to deal with the economic crisis, and its failure has generated doubts that democracy can long survive in the quicksand of an externally dominated economy.

The political context

The thirty-one-year dictatorship of General Rafael Leónidas Trujillo, who rose to power through command of the constabulary established during the US occupation, left no aspect of national life unscathed. No political institution had any domestic base independent of Trujillo and his thugs. Politicians such as Joaquín Balaguer, who had associated themselves with the regime, were widely discredited, especially among the educated in urban areas. Those like Juan Bosch, who had fled into exile, remained untainted but also unschooled in the grisly reality of Dominican politics. Thus, both Bosch and Balaguer, the towering *audillos* of the post-Trujillo era, were rendered ineffective as national leaders by the legacy of that awful tyranny.

After Trujillo's death in 1961, Balaguer, who was serving as puppet president, yielded to pressures from the Kennedy Administration and from the Dominican population and stepped down. Power was transferred to a Council of State, which scheduled elections in 1962. The elections resulted in a solid victory for Juan Bosch and his centre-left Revolutionary Dominican Party (PRD), but after only six months in office, Bosch was overthrown. The country's traditional reactionary forces—in particular, the oligarchy, the military, and the Church—had united to bring down the PRD government and to dominate the so-called Triumvirate government that succeeded it.

In April 1965, the Triumvirate was itself toppled by an uprising dominated by pro-Bosch, or Constitutionalist, forces. A civil war ensued, as reactionary elements of the military, encouraged by US

military advisers, launched an attack against the Constitutionalist and their PRD civilian supporters in Santa Domingo's poorest neighbourhoods. Facing the prospect of a victory by the pro-Bosch forces, the US President, Lyndon Johnson, sent in the marines. In elections in 1966, supervised by the US Marines and their military cohorts from a few other Latin American countries, Balaguer and his Reformist Party (PR) soundly defeated Bosch and the PRD. Balaguer was re-elected in 1970 and 1974 in elections boycotted by the PRD and most other parties.

Defying the odds of time and fortune, the *caudillos* remained very prominently on the scene in 1985 and continued to command the political loyalty of a great many Dominicans. Nevertheless, as a practical matter, the mantle of leadership had passed to another generation. This generation came of age with the death of Trujillo. The popular uprising and US intervention of 1965 represented at once its finest hour and its saddest. During the subsequent long reign of Balaguer, virtually all political activists, including some now aligned with him, suffered death threats, narrow escapes, detainment and deportation. They learned both to accept risk and to exercise caution.

It was a moderated and subdued PRD that contested and won the elections of 1978. Even so, military officers seeking to block its accession to power backed down only after the Carter Administration interceded in support of the democratic process. As Bosch had defected to form another, more leftist, party, the Dominican Liberation Party (PLD), the PRD's standard-bearer this time was Antonio Guzmán, a wealthy rancher.

Guzmán opened up the system, eliminating restraints on civil liberties and urging respect for human rights. He also purged some of the most highly politicised and reactionary military officers and reorganised the armed forces. He pledged to rein in runaway corruption, to promote economic growth and modernisation, and to provide long-neglected social services. His political position was weak, however, as he encountered fierce opposition from within his own party as well as from Balaguer's PR. And his assumption of power coincided with a steep economic decline. The sugar market had gone limp. Most other exports were in low demand as well, and petroleum, all of which had to be imported, was scarce and expensive.

A bad situation was made worse by a devastating hurricane in 1979. Thus, social services continued to be neglected, and economic development programmes were sustained only at the expense of a

sharply mounting foreign debt. Corruption scarcely abated. In fact, it is generally believed that it was embarrassment over his own daughter's involvement in shady deals that drove Guzmán to suicide shortly before the end of his term. Meanwhile, Senator Salvador Jorge Blanco, one of Guzmán's arch-enemies within the PRD, had been elected to the presidency for the term beginning in 1982.

Jorge Blanco had no considerable popular following of his own, but he brought to the presidency the reputation of a serious and honest lawyer-politician with a constructive programme. He pledged to maintain and strengthen the social and political liberalism introduced by his predecessor; to stem the tide of corruption, to which the PRD itself had fallen prey; to trim the size of the bureaucracy, which had mushroomed under Guzmán; and to expand services and protection to the disadvantaged majority. Sandly, it has been in the nature of things—the urgency of majority needs, the scarcity of national resources, the extent of private greed, the omnipresence of military intimidation and US guardianship, and the crushing pressures from foreign creditors that Dominican presidents rarely leave office with their political stock intact. Economic and political circumstances largely beyond his control combined with the weaknesses of his own administration to make Jorge Blanco's presidency a troubled and disappointing one.

The social context

Race and class

The Dominican population is deeply divided by race and class. In the early 1980s, the wealthiest 6 per cent of the population disposed of about 43 per cent of total national income, while the poorest 50 per cent shared only 13 per cent of that income.¹ Racial distinctions are hardly clear-cut, but the population is said to be about 16 per cent white, 11 per cent black, and 73 per cent mulatto. There is also a small number of orientals, but scarcely a trace remains of the indigenous Arawak population. Though racial discrimination has never been so extreme in the Dominican Republic as was the case until recently in the US South, there is no mistaking the gradations of colour from dark to light as one moves up the socio-economic pyramid.

¹ Howard J Wiarda and J Kryzanck, *The Dominican Republic: A Caribbean Crucible*. Boulder, Colorado: Westview Press, 1982, p 52.

The gentry and the new rich

Members of the white upper class are descendants primarily of Spaniards, who came in several waves between 1492 and the Spanish recolonisation of the 1860s. The Spaniards implanted their language, religion, and culture, and most subsequent immigrants, particularly the large number of Italians and Maronite Christians from the Middle East who arrived between the 1870s and World War I, were assimilated.² The early Spanish settlers hardly constituted an aristocracy. They were not wealthy, even by the standards of their time. But many did hold land and, until 1822, slaves, and they were highly race-conscious. Later immigrants from Spain and other parts of Europe tended to be less conscious of race. Men who arrived without families cohabited with black women, giving rise to a predominantly mulatto population.

The beginnings of an aristocracy were to be found in the Cibao region in the later part of the nineteenth century. Refugees from Cuba's long independence struggle, many of them highly skilled, settled in that region, intermarried with the white Dominican landowning class there, and built a thriving economy based on the export of tobacco. They also established Santiago as the country's cultural capital.

Other Cuban refugees settled further south, in the vicinity of Santo Domingo, where the terrain was more suitable for growing sugar-cane. The sugar industry continued to prosper after the tobacco trade declined, and Santo Domingo salvaged its position as the nation's commercial and financial as well as political centre. Nevertheless, Santiago maintained the reputation, and to some degree the power, represented in its full name, Santiago de los Caballeros (Santiago of the Gentlemen). Members of the Santiago aristocracy have continued to be prominent in public life.³

Traditional landowning families, from Santiago and elsewhere, have established interests in business and industry to complement their agricultural interests. But new layers of economic elites have emerged with each period of sustained economic boom. Thus there is an industrial and commercial elite that came into being during the Trujillo years and an even newer rich class—in light industry, banking and tourism, for example—that emerged during the 1970s. The newer elites

² Immigration to the Dominican Republic has been continuous in the twentieth century. One group of settlers that, although largely assimilated, maintains its identity, is the group of Jewish refugees from Hitler's Germany who settled at Sosua, on the north coast, in 1940.

³ Ian Bell, *The Dominican Republic*, Boulder, Colorado: Westview Press, 1981, pp 112–25.

include military officers and their families who profited from questionable dealings and outright corruption.

Economic elites both old and new made enormous gains in wealth and power during the Balaguer years, as the gap between rich and poor became a grand canyon. Eschewing formal channels and structures of business and government, these elites normally pursue their interests by taking advantage of networks of family and personal ties. Their perspectives extend well beyond the national society as their wealth derives directly or indirectly from international trade and investment and their taste runs to imported goods and cultural trends. Political arrangements among elite groups are generally reached in private, in country clubs or men's clubs or other gathering places of the wealthy.

The middle sector

The expansion of government and commerce, beginning during the Trujillo era, has generated an enormous increase in professional and white-collar jobs. The middle sector now constitutes some 15 to 20 per cent of the population, and its influence is increasing in politics as well as in the economy. This sector, drawing upon electoral support from—and the potential disruptiveness of—mobilised elements of the working and would-be working classes, has given substance to the rituals of the electoral and parliamentary systems and has been the prime beneficiary of the trappings of modern government.

The Dominican middle sector does not constitute an intermediate level of property holders. Nor do its representatives have other independent sources of wealth. Rather, it is a salaried sector, dependent upon the continuous expansion of commerce and government. Thus it is, on the whole, highly insecure in both income and status, and its political behaviour tends to be erratic compared to the behaviour either of elites or of manual labourers.

Representatives of the sector who occupy the leading roles in government and other social institutions as well as managerial roles in business tend to be white or nearly white, while mulattos of darker hues occupy middle and lower income and status roles within the sector. Exceptions to this rule, however, are found in the military and in electoral politics. As has been true in many other countries, the armed forces and electoral politics have constituted avenues for the social mobility of poorer and darker individuals. Electoral politics, however, as substance rather than fraud, has a short history. The road to power has generally run through the military, and it is no coincidence that the

Dominican Republic has had more black and mulatto presidents than any other nation in the Hispanic world.⁴

Though the lower margins of the middle sector are not easy to delineate, this sector generally differs in attitudes and behaviour patterns as well as in occupations and income levels, from the massive lower class. Members of the middle sector tend to be ambitious and pretentious, adopting to the extent income allows the tastes of the rich. They enjoy greater family stability than is common in the lower class, and they are highly conscious of family background and of race and colour. Unlike the elites, however, most members of this sector cannot afford to be addicted to imported goods; therefore, they constitute the domestic market for the products of domestic light industry.

The poor majority

The relative affluence of the Dominican upper and middle classes is built upon the abject poverty of some 75 per cent to 80 per cent of the population. This deprived majority is mulatto and black, its black antecedents having come directly from Africa as slaves, or in later migrations from Haiti, the British West Indies, and the US mainland.⁵ Most Dominicans are undernourished. A study released by the Dominican Planning Agency in 1978 indicated that the diets of 75 per cent of the population were inadequate and that 50 per cent had seriously deficient diets. Only 55 per cent of the population has access to safe water.⁶ Chronic unemployment affects about one-fourth of the labour force and half of the force is generally underemployed. In early 1985 unemployment was running higher than 30 per cent.

In the shanty-towns that surround Santo Domingo, the tiny makeshift houses of wood and tin typically lack electricity and running water. Open sewers spread disease among children already weakened by malnutrition. As peasants escaping the even more dismal rural areas swelled the ranks of the urban poor in the 1970s, housing and services deteriorated even further.

⁴ Wiarda and Kryzanek, *op. cit.*, p 52.

⁵ The Anglican Church, established by immigrants from the former British West Indies, is still strong in several areas, particularly along the eastern coast. Services are now conducted mainly in Spanish, however. In the area of San Pedro de Macoris, on the southern coast east of Santo Domingo, descendants of runaway slaves from the United States maintain some of their distinct customs. (Bishop Telesforo A Isaac, head of the Dominican Anglican Church. Interview. Puerto Plata, 12 January 1985.

⁶ Robert W Mashek and Stephen G Vetter, *La Fundación Interamericana en la República Dominicana una década de apoyo a las organizaciones de desarrollo locales*, Rosslyn, Virginia: Fundación Interamericana, 1983, p 14.

Urban poverty, juxtaposed against ostentatious wealth, has been a cause of embarrassment and occasionally of fear for some upper and middle class Dominicans. The urban poor have been the PRD's most reliable base of support. They fought and died for the Constitutionlists in 1965, but in 1984-85 they rioted over price increases for staple commodities imposed by a PRD government. The rural poor have not resorted to violence on any significant scale since the US occupation in the 1920s, but their desperation has been expressed in massive migration, first to provincial towns, then on to the larger cities. Such migration generally results in the atomisation of families.

The rural poor typically live in tiny houses of mud and thatch or wood or in the barren field camps (*bateyes*) of the sugar plantations. Services and social amenities are virtually non-existent. Only four of the country's twelve hospitals with more than 300 beds are outside of Santo Domingo. Despite the efforts of government and development agencies, clinics and schools remain few and far between.⁷ About 80 per cent of the rural population is illiterate and unemployment sometimes runs as high as 50 per cent. Life expectancy, at sixty-two years for the nation as a whole, is ten years shorter in rural areas.

Arable land is scarce and highly concentrated; 75 per cent of the farmers hold less than 15 per cent of the land. It is also poorly managed. Production per hectare is among the lowest in Latin America. Wealthy landowners keep much of their fertile land as pasture, producing beef for export or for the 4 per cent of the domestic population who can afford it.⁸ Landholdings that are not highly concentrated are instead highly fragmented in *minifundios*. There is almost no middle ground. Most peasants are landless or own plots too small or barren to feed a family.

Those who find work on large plantations may earn the rural minimum wage—5 pesos daily in early 1985 (considerably less than the urban minimum of 175 pesos monthly, or about 8.75 daily)⁹ but generally for no more than six months of the year. Most landowners hire fewer than ten field hands and thus are not bound by minimum wage or other labour legislation. Even the government is generally guilty of

⁷ Carlos Villaverde, Director, Centro Dominicano de Estudios de la Educación (CEDEE) Interview, Santo Domingo, 8 January 1985.

⁸ Noam Chomsky and Edward S Herman, *The Washington Connection and Third World Fascism*, Boston: South End Press, 1979, p 251.

⁹ The peso was pegged at about three to one dollar on the parallel market during most of 1984. In February 1985, the official peso-dollar parity was eliminated entirely, and the parallel rate became official.

paying less than the minimum wage to the mostly Haitian cane-cutters on its sugar plantations.¹⁰ Most peasants, whether they work for themselves or for a patron, have no old age pensions and no protection against unemployment, crop failure, natural disaster or disability. Government-sponsored crop insurance became available in 1984, but only for sizeable crops. Rural unions are rare, and where they exist they are generally even weaker than their urban counterparts. Strikes on the major plantations have often been broken by the police or the armed forces.

Land reform measures legislated by the short-lived Bosch government (February–September 1963) were weakened by the government of Balaguer (1966–78), and even the limited reforms sought by Balaguer were fiercely opposed by landowners. The Dominican Agrarian Institute, established in 1962, had distributed land from state holdings to about 67,000 families by 1980, but that was a drop in the bucket given the needs of almost half a million rural families. Furthermore, the land distributed to peasants was generally of low productivity. The best parcels had been acquired by military officers and other government officials.

In general, the distribution of land to peasant families was not accompanied by the extension of credit or technical assistance. An agrarian bank was established to make loans to small farmers, but it was undercapitalised and could not begin to meet the needs. Meanwhile, the prices of imported seed and fertilisers have soared as the peso has been devalued.¹¹

At the bottom of the social and economic heap were the Haitian labourers. Since 1952, bilateral agreements between the Dominican and Haitian governments have regulated the importation of Haitian cane-cutters for employment on the large state-owned sugar plantations, generally for six-month periods. About 20,000 cross into the Dominican Republic each year legally, but it is estimated that another 60,000 cross each year illegally. These Haitians have no civil rights and often work in conditions bordering on slavery. Like Mexican workers in the United States, they become scapegoats when the economy fails and there are widespread popular demands to block their entry or to expel those who have settled in the Dominican Republic.

A people on the move

The Dominican population is fast-growing and young. Despite an average national life expectancy of only sixty-two years and an infant mortality rate of 73 per 1,000, the country's annual population growth rate has been quite high. Estimates for the 1960s ranged from 2.9 per cent to 3.5 per cent. By 1981 the rate had dropped to 2.4 per cent. Still, rural families had an average of 6 children each, and almost half of the national population was younger than fifteen.¹²

The national population, about 6.3 million in the mid 1980s, was only 3 million in 1960. Then the population was predominantly rural, but the ratio of urban to total population increased from 30 per cent to 54 per cent between 1960 and 1980. Santo Domingo, with 1.3 million inhabitants, accounts for about one-fifth of the national population. Santiago, in the fertile valley of the Cibao, is the second largest city, with 400,000 residents.

For unhappy reasons, Dominicans are a people on the move. Rural-urban migration began in earnest in the 1930s and has steadily gathered momentum. Landless peasants, fleeing the hopelessness and boredom of the countryside, make their way first to the nearest town and ultimately to one of the larger cities, mainly Santo Domingo. Working-class families who had been in the cities and towns for several generations are outnumbered now by newcomers from the countryside.

Few, however, find their fortunes in the cities. City-dwellers also find opportunities scarce, and professionals and workers alike migrate in large numbers, particularly to Puerto Rico and to the US mainland. It has been estimated that, by the mid-1980s, 800,000 Dominicans had migrated to the United States. At least half of them were in New York City and another 200,000 or so were in San Juan. Meanwhile from neighbouring Haiti, where economic conditions are even worse, desperate workers, documented or otherwise, continue to pour over the borders into the Dominican Republic. Their numbers were estimated at 100,000 in 1983.¹³

Migration is an important factor, but only one of several factors that cause instability in the family unit among the poor majority of Dominicans. Common law unions have long been the rule rather than

¹² Paul B Goodwin Jr (ed) *Global Studies: Latin America*, Guilford, Conn.: The Dushkin Publishing Group, 1984, pp 176-7.

¹³ *Ibid.* See also Mashek and Vetter, *op. cit.*, pp 13-14, and Tom Barry, Beth Wood and Deb Preusch, *The Other Side of Paradise: Foreign Control in the Caribbean*, New York: Grove Press, 1984, p 291.

the exception, particularly in rural areas. Marriages may be civil or religious or both, but priests are scarce in rural areas and civil marriages would require at least two trips to the nearest town. Since legal questions are likely to arise only when property is involved, the 75 per cent to 80 per cent of the population who have virtually no property have little incentive to formalise their unions. These unions may nevertheless be permanent, and several decades ago family relationships in rural areas were more stable than those in cities. But that is no longer the case. The push from the countryside and the pull of the town affect both men and women.

It is estimated that only 20 per cent of all cohabiting couples in the Dominican Republic are legally married.¹⁴ Among the poor, cohabitation, whether or not it involves a marriage, is often temporary. Many households are headed by women; mothers provide continuity for their children who may have different fathers. Within the past decade, upper- and middle-class women have made considerable progress in integrating business and the professions, and they have begun to assert themselves politically as well. Lower-class women, however, continue to have enormous responsibility without authority.

Economic growth and diversification

The Dominican economy has suffered in exaggerated form from the problems of uncertainty and dependency and from the deterioration in the terms of trade for producers of primary products that have plagued the Third World generally and Latin America in particular. Sugar-cane cultivation was introduced to the island by Columbus himself, and the problem of the concentration of landholdings on the one hand and increasing landlessness on the other dates to the arrival of the earliest settlers. Nevertheless the republic's economy was based essentially on subsistence agriculture until the Trujillo era. Trujillo transformed the economy for his personal advantage and coincidentally left behind an export-oriented economy heavily dependent on sugar. Sugar dependency has put the economy on a roller-coaster, reaching occasional highs of prosperity only to plunge once again to depths of debt and despair.

Economic growth since the early 1960s has been erratic but substantial. Between 1960 and 1980 real per capita income rose from

¹⁴ Bell, *op. cit.*, pp 130-2.

\$513 to \$1,050, while gross domestic product rose from \$1.8 billion to \$5.7 billion.¹⁵ After 1980 the Dominican economy, along with that of the United States and of much of the rest of the Western world, slipped into recession.

Growth has generally come in spurts. There was a spurt in the late 1960s induced largely by US aid and investment, as the US government sought to show that its military intervention had been beneficial and US investors rushed to take advantage of new incentives. The average of 5 per cent annual growth in the 1970s represents a levelling of the peak of 9 per cent to 10 per cent growth in 1974–75, resulting from high sugar prices, and the trough of 1978 when low sugar prices and the soaring cost of imported oil combined to produce economic decline. The price of sugar has continued to sink in the 1980s. From a high of 76 cents a pound in 1975, it has dropped by 1985 to about 4 cents a pound, less than half of the cost of production.¹⁶

All governments since the early 1960s have sought to diminish the country's dependence on sugar, and considerable diversification has taken place, both within the basket of agricultural exports and in the economy as a whole. Sugar declined, during the 1970s, from 48 per cent to 35 per cent of all exports, while exports of coffee, cocoa and tobacco increased to account for about 30 per cent. Perhaps more importantly, under the Guzmán government, in 1979, the country became self-sufficient, for the first time, in rice and beans, the staples of the Dominican diet. The Guzmán government had placed a high priority on the expansion of food production for domestic consumption and the retardation of migration from the countryside to the cities. That self-sufficiency was only temporary, however. The country is generally close to self-sufficiency in rice, but remains, in most years, a net importer of beans.¹⁷

Almost half of the work force was still in agriculture in the early 1980s, but agricultural output had declined in the previous two decades from 26 per cent to 17 per cent of the gross domestic product. Governments had consistently given priority to industrialisation, and manufacturing had grown from less than 1 per cent of GDP to 18 per cent. Industrial growth was particularly notable in sugar refining,

¹⁵ Mashek and Vetter, *op. cit.*, p 13.

¹⁶ Roger Lowenstein, 'Gulf and Western pullout stuns Dominicans', *The Wall Street Journal*, 18 June 1984, p 26.

¹⁷ Aaron Ford, agriculture officer, US Agency for International Development, Interview, Santo Domingo, 8 January 1985.

textiles, pharmaceuticals, and cement. Exports from the light industrial sector now account for up to one-fourth of the country's foreign exchange earnings. New government agencies have been created to finance industrial development and to seek new markets for Dominican products.

Mining has also of late become an important activity. After the obscene clamour for gold by the *conquistadores* and early settlers, the island's mineral resources were virtually ignored until the last few years of Trujillo's reign. The exportation of bauxite was begun in the late 1950s, but it was not until the late 1960s that nickel became an important export. The country's newest mineral export—newest, that is, since it was last exported in the 1520s—is gold. Gold, in alloy with silver, has been exported since 1975. At the beginning of 1980, gold, or *doré* as the alloy is known, became the republic's most valuable export, but the gold market weakened later in the year. Nevertheless mining, led by ferronickel, continued to account for about one-fourth of total exports.

Tourism is another of the country's booming new industries. Until the 1970s, tourism was scarcely significant as a source of foreign exchange, but during that decade the number of tourists visiting annually more than tripled, rising to about half a million. The tourist industry has generated thousands of jobs though mostly low-paying ones, and has had important spin-offs for construction and other industries. It has also spurred government investment in infrastructure, particularly in the construction of roads and airports and the modernisation of the old city centre of Santo Domingo and the old port, Puerto Plata, on the North Coast. INFRATUR, a government agency created in 1971, supervises expenditures related to the promotion of tourism. President Guzman created a new cabinet position for the oversight of tourism, and the Jorge Blanco government has made the promotion of tourism one of its highest priorities.

As has been mentioned, the new prosperity of the 1970s was narrowly disbursed. It made the old rich richer, created new categories of new rich and expanded the middle class, but it did not trickle down to the poverty-stricken majority. This was in part a consequence of policy decisions rather than of policy failures. For the large contingent of state employees, wages and salaries were frozen by government edict. For most other categories of workers, wages were depressed as a consequence of high levels of unemployment and the repression of organised labour.

Much of the new industry was capital-intensive, so that the number of

new jobs created was not nearly equal to the number of would-be workers entering the labour force. Furthermore, rapid economic growth generated inflation. The single- and double-digit levels of inflation the country has experienced in recent years seem mild compared to the triple-digit inflation experienced in some other Latin American countries, but such inflation was devastating to those whose wages were frozen, not to mention to the half of the population that was unemployed or underemployed. Furthermore, with the introduction in the early 1980s, at the behest of the IMF, of the floating parallel rate of exchange for the peso, inflation was mounting rapidly. It was officially pegged at 34 per cent for 1984, but government calculations underestimated the real burden of inflation.¹⁸

Finally, the system of taxation did nothing to redress imbalances; in fact, it made things worse. Personal income taxes, ranging from 2 per cent on salaries to 10 per cent on real estate earnings, are among the lowest in the hemisphere, and only a fraction of those eligible actually pay. Corporate taxes range from 10 per cent to 49.4 per cent, but both personal and corporate tax laws are full of loopholes. Income taxes account for no more than one-fourth of the total tax burden. The remainder are import and export levies, excise taxes, licence fees, and, since 1983, value-added taxes—all taxes that are ultimately passed on to the consumer. Furthermore, citizens who can afford to pay in other ways—e.g., private schools, private security guards—do so in order to compensate for the inadequacy of public services.

Dependency and development

The growth and modernisation of the Dominican economy since the 1960s have been impressive, but such growth and modernisation have been largely fuelled and controlled by foreign—mainly US—companies and by US markets and suppliers. The US supplies about half of the republic's imports and purchases about two-thirds of its exports. It follows that the republic's options have been severely limited and that factors other than the public interest and welfare of Dominicans have often governed economic decisionmaking.

The Dominican economy was already linked to that of the United States through trade and US loans and investments before the turn of

United States Embassy, Santo Domingo, 'The Dominican Republic: Investment Climate Report', December 1984.

the century and the links were drawn tighter, of course, during and after the US occupation of 1916–24. But the new wave of US investment dates to the mid to late 1960s when constitutional obstacles, including limitations on the foreign ownership of land, were removed or modified; labour was pacified; a range of incentives were offered to investors by both Dominican and US governments; and US public assistance financed infrastructure projects that were helpful to business.

Foreign investment has been heaviest in agribusiness and food processing but has also increased sharply in mining, tourism, light industry, banking, insurance, and real estate. In the early 1980s there were some 125 subsidiaries of US firms operating in the Dominican Republic many of them in one of the country's four tax-free zones.¹⁹ Many more US investors have small business holdings. US-based corporations accounted for about two-thirds of the total registered foreign investment. Canadian-based ones for about one-fourth. (Falconbridge, owner of the nickel mine at Bonao and thus the second-largest private investor in the republic, is registered in Canada but its major shareholders are US-based.) The only other country having a high level of investment was Britain. Among US firms, the heaviest investors were Exxon, Texaco, Citibank, GTE, Atlantic Richfield, Colgate-Palmolive, Wometco, Philip Morris, and, until January 1985, the giant among US multinationals, Gulf and Western.²⁰

Gulf and Western had more than \$200 million invested in some ninety businesses in the Dominican Republic. It was the country's largest private landowner, with about 8 per cent of all arable land, and its largest employer. The centrepiece of Gulf and Western's Dominican empire was the sugar plantations and refinery complex—the country's largest—at La Romana, which Gulf and Western acquired from the South Puerto Rico Sugar Company in 1967.

Gulf and Western also maintained a 350-room seaside resort at La Romana. In 1969 Gulf and Western took over management of a large tax-free zone adjacent to its Cajuiles golf course. Foreign companies settling within the zone enjoy duty-free import and export privileges and a ten-year tax-free status. The zone is surrounded by a high fence

¹⁹ The US-based owner of a factory in one of the tax-free zones, who asked not to be identified said that his Dominican operations were 20 per cent more productive than similar operations in the Far East. His workers' base pay was 40 pesos a week (about \$2 a day). They could earn up to another 140 pesos a week in piece-work, but piece-work pay carried no fringe benefits. The furniture toys made in his factory were sold to a Norwegian cruise liner for 8 to 10 dollars a dozen. They retailed on the cruise for 8 to 10 dollars each.

²⁰ Barry, Wood, and Preusch, *op. cit.*, p. 297.

topped with barbed wire and its entrances are guarded by national police as well as customs agents. US AFL-CIO officials who visited the zone in the late 1970s said it had the air of a 'modern slave-labour camp'. They believed that its controlled access was designed primarily to thwart labour organisation efforts. In fact, an organising effort in the mid-1970s had been broken by police and troops armed with submachine guns.²¹

Global annual sales of Gulf and Western are larger than the GNP of the Dominican Republic, and the Dominican government was left in a poor bargaining position when it came to the mobilisation of professional manpower and influence. The company cultivated good relations with military and police officials, relations which were useful in maintaining labour peace. It was accused of employing repressive tactics against labour leaders and political antagonists and of outright bribery. It had been engaged in a running dispute with PRD governments since 1978 over tax evasion and other irregularities in which the Balaguer administration allegedly connived.²² Even the US Securities and Exchanges Commission (SEC) alleged that Gulf and Western withheld millions of dollars it owed to the Dominican government,²³ that it made 'questionable' payments through foreign subsidiaries, and that it entered into a secret agreement with Dominican government officials to speculate in sugar.²⁴

Thus, Gulf and Western was an obvious target for nationalistic resentment. Nevertheless, it was readily conceded that the company was less miserly with its employees than were many domestically owned firms and that, in fact, it treated its cane-cutters far better than the government did the unfortunate Haitian contract labourers. Furthermore, the company sponsored a social development programme, providing housing, clinics and schools for its workers, and it was generally believed that the company's international president, Charles Bluhdorn, and his family had taken a special interest in the country. At any rate, to Dominican nationalists Gulf and Western was at least a known adversary. Therefore, the news that Gulf and Western was selling off its Dominican properties was generally received with disquiet rather than relief.

²⁴ Pamela G Hollie, 'Gulf and Western to sell Dominican holdings', *The New York Times*, 13 June 1984, pp 1, 39.

After Bludhorn's death in early 1983, Gulf and Western's new president, Martin S Davis, decided that the company would concentrate on high-return consumer products, leisure businesses and financial services and divest itself of several major lines of business. The decision to sell the Dominican properties was announced in June 1984. It was said to be based on the discouraging long-term prospects for sugar exports as well as on a decision taken the previous month by the Dominican government; the government, desperately low on foreign exchange reserves, required exporters to turn in their dollars for local currency at an artificially low rate of exchange.²⁵

It was announced in October 1984 that a purchase agreement had been reached between Gulf and Western and the Fanjul family of Florida. The transfer of ownership was completed in early January 1985. The group of investors, who acquired Gulf and Western properties in Florida as well as in the Dominican Republic, is headed by the Fanjul brothers, Alfonso and Pepe, Cuban-Americans whose family had been producing sugar in Florida through the Osceola Farms Company. Other investors in the Fanjul group include the Flo-Sun Land Corporation and other Florida-based agribusiness firms and a Dominican group that had been involved in local management of Gulf and Western properties, including Carlos A Morales Troncoso, president of the Americas Corporation.²⁶

Morales Troncoso is to retain the titular presidency of the umbrella corporation, and the new owners have announced no major changes in the management of the former Gulf and Western properties. Nevertheless, the transaction has left officials of the PRD government and other Dominican political leaders uneasy. They fear that the Gulf and Western pull-out might discourage other potential investors and that the anti-Castro militance of the Fanjuls and their associates might result in activities and decisions based on political rather than business criteria.

Of course, Gulf and Western and now its successors in the Fanjul group have been only the largest sources of anxiety. The behaviour of other foreign corporations and subsidiaries has been equally unaccountable and, in some cases, arrogant. Falconbridge, the country's second-largest foreign investor, has been engaged since the mid-1970s in a dispute with the government over taxes and has

periodically threatened to close its nickel mine if the government pressed its claims. Philip Morris, in the 1970s, according to an SEC report, made a \$16,000 payment to a Dominican tax official; made payments amounting to \$120,000 to various Dominican legislators for passage of an advantageous law; and made monthly payments of \$1,000 to Balanguer himself.²⁷

The corruptive influences exercised by foreign companies represent only one of the detrimental aspects of the republic's circumstance of economic dependency. Dominican prosperity has been contingent from year to year upon the size of its sugar quota in the US market and upon other import quotas and fees based on considerations of US domestic and foreign policy with little regard for Dominican needs. Uncertainty about the US market coupled with the wildly fluctuating price of sugar has rendered economic planning and forecasting almost futile.

Dominican export prospects became much brighter after the Cuban revolution when the US stopped importing Cuban sugar. Since then the Republic has exported more than 85 per cent of its sugar to the US and has provided the US with most of its imported sugar. In 1982, however, the Republic was dealt a severe blow when, in response to lobbying by US sugar growers, the Reagan Administration instituted a new system of duties and quotas to restrict sugar importation.²⁸

While prices and markets for its own products have been uncertain, there has been a devastating certainty in the steady climb of the costs of imports essential to industrialisation—imports of capital equipment as well as of raw materials for the production processes. This had led to increasingly serious balance-of-payments problems. The current account has not had a surplus since about 1967, and the deficit in the early 1980s was hovering around \$100 million.²⁹

The cost of imports is hardly offset by tax revenues from foreign holdings and the profits of foreign enterprises. In order to maintain a competitive advantage in attracting foreign capital, the republic must offer generous tax holidays, high ceilings on profit repatriation and other incentives and subsidies.³⁰ It must also invest its own scarce

³⁰ Companies that set up manufacturing operations in the free zones, for example, benefit from government subsidies and at the same time are 100 per cent exempt from Dominican income taxes and duties.

revenues in infrastructure projects beneficial to investors. The revenue gap can be bridged only by borrowing, even in times of soaring interest rates. (By 1985, the foreign debt had climbed to almost \$3 billion). Thus, the price of development, or modernisation, for an economy so heavily dependent on foreign markets and suppliers, foreign investors and foreign creditors is chronic insolvency. Such insolvency means, of course, that the needs of the general population for social services and welfare will not be met.

Dependent development also means, as we have seen, the decline of traditional activities, such as subsistence farming, the absorption or displacement of domestic enterprises and the inhibition of domestic entrepreneurship. It means production for a limited domestic market and capital-intensive industrial processes that do little to alleviate unemployment. Unemployment and low wages inhibit the development of a domestic market, thus maintaining the model of production only for export and for the affluent few. Finally, over time, it means the suppression of national culture and the transplantation, in its place, of an alien culture and way of life.

Conclusion: a hollow victory

Is broadly beneficial development possible in a context of extreme economic dependency? Is political development sustainable in the face of economic deterioration? Final answers are not in, even in the Dominican case, but the Dominican experience thus far leaves us little room for optimism. The opening of the political system coinciding as it has with a virtual closing of the economic one, has been for the poverty-stricken majority a hollow victory.

Many of the legislative proposals of the PRD government have been far-sighted and humane, but the economic crisis has made a mockery of them. Among the more specific development goals articulated by the republic's popularly elected presidents since 1978 have been rural resettlement and technical assistance to small farmers so as to increase domestic food production, raise rural incomes, and slow the pace of migration to the cities; diversification of economic activities and export industries so as to make the economy less vulnerable to price fluctuations in world markets, particularly for sugar; attraction of foreign capital so as to accelerate the creation of jobs, but under the conditions that preserve a measure of local control; the further exploitation of hydroelectric power and the search for other domestic

sources of energy; and the expansion of social services and welfare programmes. The more ambitious and more nearly revolutionary goals erected by the ruling Revolutionary Dominican Party (PRD) in its youth in the early 1960s have not been abandoned entirely, but they have been set aside for pursuit on a sunnier day.

Contemporary PRD governments have had some notable successes. The republic has become self-sufficient—at least during some years—in the production of its staple foods, rice and beans. Progress has been made in the promotion of tourism and in the construction of physical and institutional infrastructure to support new industries. Gold, from a mine owned by the state, has become an important addition to the export list. Several hundred new clinics and schools have been built, and literacy and vocational education programmes have been promoted.

Nevertheless, progress in most areas has been meagre at best. In fact, the good intentions, and in many cases good legislation, of the PRD have been virtually nullified by the lack of funds for implementation. *Many urgent problems have remained unattended, have resisted governmental solution, or have been aggravated by the recession that set in in the late 1970s.* Many government agencies and enterprises are virtually bankrupt, and new clinics and schools lack medicines and books. Deprivation and despair in the countryside, and in some areas the encroachment of agribusiness, continue to push peasants into the unwelcoming city. Even before the recession hit, the creation of new jobs in industry was failing to keep pace with the appearance of new job-seekers. Whereas in 1970 there were seven jobs for each one hundred urban dwellers, by 1977 there were only five jobs per hundred.³¹

Rising prices for imports, especially petroleum, falling prices for exports, and the consequent urgent need for more foreign credit in the face of servicing requirements for an already enormous foreign debt, have left the country in a chronic economic crisis. The IMF's austerity solution, which there as elsewhere in the Third World has been the price of keeping credit lines open, has meant cuts in wages and social services and increases in prices and working hours. As usual, most new hardships have been borne by the working and would-be-working classes rather than by the affluent.

The most promising developments in the Dominican Republic within the last two decades have occurred in the political sphere rather than in

the economic one. Those decades have seen tyranny and anarchy, military intervention, civilian uprising, US occupation, and government-sanctioned terror, but they have also seen the development of a modern political party, of the seeds of a labour movement, of organisation among women, students and others who presume to speak for the traditionally disadvantaged, and of new approaches to cooperation at the community level. Those decades have seen the beginnings of universal adult franchise and free elections. The period since 1978 has also seen progress in the subordination of the military to civilian authority and in the expectation that decisions of the electorate will be honoured.

Nevertheless, neither the government nor its congressional opposition has exhibited the resourcefulness and statesmanship demanded by the seriousness of the economic crisis. Thus the crisis, manifested in particular in periodic sharp devaluations and soaring prices for staple commodities, has resulted in rioting in several cities and in heavy-handed government countermeasures and has given rise to a concomitant political crisis.

PRD leaders are appropriately concerned that the sinking economy may be taking with it their popular support and their hope for remaining in government. But they hope that the public—even the younger generation that has not known the risks they assumed and the repression they endured—will appreciate what they have accomplished in the institutionalisation of democracy, of civil liberties and civic order, and that they will appreciate as well that the new liberal order is fragile and may be lost.

The explosiveness of the situation has caused unease among political leaders across the spectrum, and the example of turmoil in Central America has had a sobering effect on both Right and Left. Party leaders on the Left fear that rioting or other forms of civil disturbance on the part of the masses might lead to military intervention and violent repression. Civilian leaders on the Right fear that military intervention and violent repression might lead to revolution. Furthermore, there is a generalised fear that the economic crisis is beyond solution, that under the restraints imposed by the IMF not even the most honest, competent and committed government could bring relief.

As none of the major parties wishes to bear alone the blame for hardships seen as inevitable, there has been, at least on occasion, a certain drawing together of ideological poles. A predilection to compromise among political elites, however, is no consolation at all to

the masses of poor Dominicans, who appear to be increasingly alienated from all political institutions. If the country's newly legitimate political institutions fails utterly to protect the population from the vagaries of international markets, the arrogance of foreign investors, the impatience of foreign creditors and the rigidities of the IMF, the republic may yet revert to its earlier pattern of anarchy and tyranny or follow the path of Central America into endless cycles of insurgency and counter-insurgency.

From the ashes: the rebirth of the Philippine revolution—a review essay*

Not surprisingly, the Philippine left commands much attention these days. After all, it leads the only rising revolutionary movement in South East Asia, where left-wing organisations have suffered serious setbacks in Indonesia, Thailand, and Malaysia.

The attention comes from both friend and foe. At a time when China's revolutionary reputation has been besmirched by its dalliance with the US, Israel and South Africa, and the Western press has successfully cast a grey pall over Vietnam because of its presence in Kampuchea and the understandable dislocations created by socialist construction, the Philippine New People's Army (NPA) has joined the Sandinistas and El Salvador's FMLN-FDR in the front rank of the progressive movement's pantheon of contemporary heroes.

The growing concern displayed in counter-revolutionary circles, on the other hand, is accompanied by a curious mixture of loathing and respect. Typical of this is a recent assessment by a senior official of the Reagan administration. The leadership of the revolutionary movement,

* The following works are reviewed in this article: Amado Guerrero, *Philippine Society and Revolution*, Oakland, California: International Association of Filipino Patriots (This volume also includes Guerrero's *Specific Characteristics of Our People's War*); Francisco Nemenzo, 'The millenarian-populist aspects of Filipino Marxism', in *Marxism in the Philippines: Marx Centennial Lectures*, Quezon City, Philippines: Third World Studies Center, 1984; Francisco Nemenzo, 'Rectification process in the Philippine communist movement' in Joo-Jock Lim and S Vani (eds), *Armed Communist Movements in Southeast Asia*, Aldershot, England: Gower, 1984, pp 72-101; Francisco Nemenzo, 'An irrepressible revolution: the decline and resurgence of the Philippine communist movement', Manila, 1984, unpublished manuscript; US Senate Foreign Relations Committee Staff, *The Situation in the Philippines*, Washington, DC: US Government Printing Office, September 1984.

he told the press, 'is a group of several hundred dedicated, ideological, hard-bitten Marxist-Leninists [who are] very disciplined and quite able.'¹

Discovering the NPA

It was only after the Aquino assassination that the US government really discovered the New People's Army (NPA). After years of routinely repeating the Marcos regime's severely understated figures on NPA strength, the Pentagon sounded the alarm on 7 February 1984, when it informed the House of Representatives Subcommittee on Asia-Pacific Affairs that about one-fifth of the Philippines 40,000 villages were influenced by an estimated 10,000 NPA regulars. 'We do not know how many non-combatant NPA supporters there are among the Filipino people but NPA efforts to build more support in the countryside have been most impressive.'²

Surprised by the Pentagon's *volte-face* on the strength of the Philippine insurgency, the US Senate Foreign Relations Committee sent its own team to investigate the situation in the summer of 1984. *The Situation in the Philippines* is the product of that mission. Surprisingly, the document is a reasonably objective effort to assess the Philippine insurgency, although it does lapse now and then into anti-communist rhetoric.

In assessing the strength of the NPA, the authors imply, first of all, that they have to rely on the NPA's published estimates of its own strength, because 'Although there is no way of knowing for sure, many observers believe that the NPA claim more nearly reflects the true state of affairs.' Though not as frank in acknowledging it as the Senate staff, the Pentagon, CIA, and State Department have, in fact, engaged in the same practice of taking the NPA at its word. This underlines two things: first, as in Iran, a massive intelligence failure has characterised US efforts to understand the true scope of the insurgency; second, the NPA has a reputation for carefully estimating its own strength and assessing the correlation of forces between it and the government.

For US policymakers, the Senate report paints a bleak prospect. The insurgency keeps growing despite the fact that it is receiving 'little or no outside support'. It is widespread: the NPA units operate in sixty-two of

¹ 'Philippines insurgency cited', *Washington Post*, 9 February 1985.

² Testimony of John Kelly, Deputy Assistant Secretary of Defense, before House of Representatives Asia-Pacific Affairs Subcommittee, 7 February 1984.

the country's seventy-three provinces and 'challenge the AFP [Armed Forces of the Philippines] across the length and breadth of the Philippine archipelago'.

The authors cannot conceal their respect, if not admiration, for the enemy when they discuss the reasons why the insurgency has reached this point. They attribute this to three principal factors: a brilliant military strategy, superior image-building, and an innovative organisational principle.

The guerrillas' strategy of creating multiple guerrilla zones and bases throughout the Philippine archipelago instead of a few central base areas has had devastating consequences for the Philippine Army, since it has denied the latter the opportunity to mass its forces for concentrated attacks and stretched it to the breaking-point by forcing it to cover many small guerrilla fronts in the country's nine major islands.

The NPA's mass support among peasants is attributed, not mainly to terror, as in standard right-wing analysis, but to the fact that it 'has carefully and effectively cultivated the image of being a "Robin Hood"'. So effective have they [the guerrillas] been, in fact, that many local people we talked to even used the term when describing the NPA's activities.'

But it is for the NPA's organisational principle of 'centralized leadership and decentralized operations' that the writers reserve their highest—though understated—praise. This is not a movement that one can bait with the old anti-communist stereotype about politburos monopolising decisionmaking, thinking and initiative. The power of the insurgents, the authors discover, lies precisely in the fact that rank-and-file units are encouraged to think, decide, exercise initiative, and be creative . . . while carrying out the thrust of the overall military and political programme:

Operating successfully requires a high order of discipline as well as individual initiative. . . . Many we interviewed feel that this is one of the NPA's great achievements. They credit the NPA's national recruitment scheme for much of the success. It brings in both new intellectuals from the campuses and young people from areas under its influence, and tests them under battlefield conditions. The best of the new and old are then sent to expand the revolution into new areas.

However, the writers cannot allow themselves to be carried too far. One can give the devil his due, but he is, after all, still the devil. Thus, the text is interspersed with the usual anti-communist rhetoric which many pragmatic liberals and technocrats must resort to to keep their good

standing within an ideologically oriented right-wing administration. Thus, the NPA and the communists are depicted as external agitators who skilfully 'exploit local grievances'. 'Intimidation also plays an important role in the process' of winning support, the writers allege. The guerrillas 'cultivate' the image of being Robin Hood. Their 'calculated tactics' of executing informers and corrupt individuals and local criminals 'are contemptible and deserve condemnation'. And topping all this is what amounts to an act of faith rather than a statement of fact: the 'vast majority of Filipinos find communist ideology distasteful and NPA tactics abhorrent no matter how neatly they are packaged.'

Despite these flaws, the Senate report surely ranks as one of the first serious efforts of the US government to come to grips with the reality of the Philippine revolution. It is doubtful, however, that its conclusion that the revolutionaries are popular, homegrown, and receive no external support from the Soviet Union will make a dent in the Reagan administration's determination to escalate its level of intervention in the Philippines.

The authors of the report are Fred Browne, a key staff-member of the Senate Asia-Pacific Affairs Subcommittee, and Carl Ford, who served as an assistant to Senator John Glenn. They have numerous counterparts in other US agencies now monitoring the unravelling Philippine situation. Presumably some of them, particularly those in the CIA, have been delegated with the task of repeating the feat performed in the 1950s by the legendary Colonel Edward Lansdale, who headed the counter-insurgency effort which smashed the communist-led Huk rebellion. Given the sophistication and skills of the current crop of highly motivated guerrillas who have learned the lessons of that disaster, many Pentagon and CIA officials acknowledge that Lansdale's act will be a hard one to follow.

The Huk *débâcle*

The defeat of the Philippine left by Lansdale and his Filipino protégé, Ramon Magsaysay, in the early 1950s was a tragedy of major proportions for the progressive movement. Francisco Nemenzo's stimulating work is an attempt to come to a sensitive understanding of the reasons for this *débâcle* and the subsequent degeneration of the Partido Komunista ng Pilipinas (PKP) into an ineffectual force.

Unlike Brown and Ford, Nemenzo approaches his subject from the left. His partisanship does not, however, get in the way of critical

analysis. Nemenzo also has the advantage of having been an insider, one of the younger members of the PKP leadership during the crucial years of the 1960s, when the PKP was torn by the schism that later resulted in the founding of the Communist Party of the Philippines (CPP). A former dean of the University of the Philippines' College of Arts and Sciences, Nemenzo survived the PKP's execution of almost half of the Central Committee of the Marxist-Leninist Group (MLG), a breakaway group from the PKP of which he was one of the key leaders.

Founded in 1930 by the printer, Crisanto Evangelista and other working-class leaders, the old PKP emerged as a major force in Philippine politics during World War II, when it forged a peasant guerrilla army, the *Hukbalahap* or 'Huks', that led the anti-Japanese struggle in Central Luzon. In a climate of severe class conflict between peasants and a landlord-dominated government in the late 1940s, the leadership decided to risk all on launching an uprising that was meant to bring the left to power in two years. With the help of the US, the Philippine government turned the tide in 1951 with a cunning strategy which combined the promise of free land and land reform, counter-guerrilla military operations, 'clean elections', and the successful projection of Ramon Magsaysay as a reformist, populist president. The PKP's defeat inaugurated a period of demoralisation of the left and McCarthyism in the larger society which were only shaken off in the latter half of the 1960s.

Nemenzo, however, refuses to place the blame principally on external causes. Like Amado Guerrero, who led the split from the PKP that later resulted in the establishment of the CPP and the NPA, Nemenzo places the emphasis on the internal failings of the PKP. Nemenzo's essays add depth and detail to the analysis laid out in Guerrero's brilliant 1967 critique of the PKP, *Rectify Errors and Rebuild the Party*.

Among the key shortcomings which both Nemenzo and Guerrero point to was the hegemony attained by middle-class intellectuals who combined eclectic Marxist theorising with dangerously pragmatic practice. Typical of this was the decision to seize power through a swift armed uprising in 1948. It was justified by the then Secretary-General, José Lava, with the reasoning that with the US losing China to Mao's communists in 1948 and the world standing on the brink of an economic cataclysm worse than the Great Depression, the US would withdraw from the Philippines and Asia and focus its energies on rehabilitating Western Europe. Whether or not the party leadership sincerely

believed this justification, the recourse to armed struggle, says Nemenzo, was in reality a desperate response to the Philippine government's refusal to seat parliamentary representatives supported by the PKP and the government-sanctioned repression of PKP-led organisations by landlords' private armies.

The initial successes of this defensive move led the leadership impulsively to transform it into an ambitious offensive strategy intended to bring the PKP and Huks to Malacanang, (the Philippines' White House) in two years' time. The PKP paid dearly for this hurried attempt to seize power without building up the political, ideological, and military infrastructure for sustained guerrilla warfare, when the Philippine government, with massive US assistance launched its counter-attack in 1951.

Nemenzo and Guerrero also point to the ideologically debilitating impact of the merger in 1938 of a working-class party structured along Leninist lines with the populist, peasant-based Socialist Party whose following was held together by charismatic bonds to the leadership. Nemenzo carries the analysis one step further with his provocative thesis that the ideology of peasant millenarianism overwhelmed working-class ideology rather than the other way around:

The 1938 merger diluted not only the class character of the PKP but also its already eclectic understanding of Marxism-Leninism. It brought a deluge of peasants into what was initially a genuine proletarian party and imbued it with a pronounced millenarian outlook. . . The communist intellectuals who write the party documents (duly embellished with scientific concepts to impress their foreign comrades) did not mind all this, realizing that the quickest way to build a mass base and drive them to heights of political ecstasy was to invoke primitive ideas and tolerate quasi-anarchist behavior.

Theoretical eclecticism, pragmatism, and peasant millenarianism were a devastating combination. To these factors, which largely accounted for the defeat of the Huk insurgency, was added, during the McCarthyist period following the disaster, the infamous 'single-file policy' which hastened the PKP's degeneration. This policy, adopted in a climate of legal repression, ordered each party member to operate individually, maintaining contact with no more than two other members, one from whom he received instructions, the other being the person to whom he transmitted them. What Nemenzo characterises as 'a sharp departure from a cardinal Leninist principle' contributed to the transformation of many of the armed remnants of the PKP's military arm into roving rebel bands, engaged in extortion and criminal

activities, deprived as they were of effective political leadership and collective life.

Suffering from the trauma of defeat and cowed by legal repression, the PKP leadership failed to grasp the revolutionary potential of the nationalist upsurge and the rebirth of student activism in the late 1960s. Having limited its horizon to becoming a legal party engaged in the 'parliamentary struggle', the PKP isolated and expelled young dissenters who called for bolder strategies, branding them as *agents provocateurs* or 'CIA agents', or, in some instances, physically liquidating them—as it did to Nemenzo's group—to avoid being repressed by the Marcos state.

The ultimate result of a timid, defensive political programme was the PKP's surrender to the Marcos regime in 1974. The PKP justified its action by invoking the rationale that Marcos and his faction of the ruling class represented the 'reformist national bourgeoisie'. Nemenzo remarks, 'A rose by any other name smells just as sweet'; and proceeds to describe the pathetic spectacle of a communist party giving up in the midst of a revolutionary upsurge:

The process culminated in a nationally televised reconciliation meeting at the presidential palace between President Marcos and the secretary general in October 1974. Stacks of rifles and piles of ammunition were turned over to the PC [Philippine Constabulary] chief at public rallies in Nueva Ecija and Laguna. Obedient party members then queued at the PC headquarters to be photographed and fingerprinted like common criminals. However, there were also hundreds of others who hurriedly resigned rather than submit to the supreme humiliation.

Revival

While the PKP was negotiating a separate peace with the Marcos government, the CPP and the NPA were into their fifth year of establishing and defending zones of political and military influence in the countryside of Luzon. Hard-pressed by government encirclement and suppression campaigns, the young revolutionaries nevertheless stood on the eve of the momentous expansion which would bring their units ten years later to most of the Philippines' provinces.

To understand the revitalisation of the left and its current position of strength, one must start with José Maria Sison and Amado Guerrero. The interaction of personality and history continues to be a major topic of academic debate, but there is no doubt that Sison and Guerrero (said

to be Sison's *nom de guerre*) have played a decisive role as midwives of the current Philippine revolution.

Amado Guerrero is, by most accounts, a remarkable individual. A glimpse of one aspect of his personality is provided in Nemenzo's account of the recollections of some of the individuals who attended the Congress which re-established the Communist Party on 26 December 1968: 'It was only out of respect for Amado Guerrero that they agreed to attend; and they had a premonition of its historic significance. At the meeting, Guerrero brimmed with optimism, but the rest secretly nursed doubts about the whole project.'

Guerrero, however, is no mere revolutionary optimist. He is also a superb theoretician, a skilful and sharp polemicist, a master of organisation, and a very determined leader. All these qualities were evident in the internal party report, *Rectify Errors and Rebuild the Party*, a relentless and comprehensive criticism of the ideological, political, organisational, and military practice of the PKP which served as the founding document of the CPP.

Unlike *Rectify Errors and Rebuild the Party*, Guerrero's *Philippine Society and Revolution* was intended to be a document for public debate and popular education. It is not a work which academics will find congenial, for its perspective is not that of a detached observer or an academic Marxist. It shifts easily from profound analysis to sharp polemic to passionate prescription. Nonetheless, as a theoretical enterprise, *PSR*—as the book came to be called—is remarkable, a work against which all previous and subsequent Marxist works on the Philippines have to be measured.

Guerrero was attempting what Mao had done in China and what Mariategui has accomplished in Peru: that is, drawing out the 'laws of motion' of Philippine society through an application of the concepts of class, class conflict, mode of production, and imperialism to Philippine history.

The Philippine social formation which emerges from this analysis is a semi-colonial, semi-feudal society. Colonisation by Spain and later imperial control by the United States disrupted the internal evolution of Philippine class society. The contradiction between the Filipino people and imperialism and the social classes which constituted imperialism's 'domestic social base' consequently became the engine of historical motion.

The Philippine 'bourgeois-democratic revolution' still has to be pleted, asserts Guerrero. The Revolution of 1896, directed both at

inconsistent, and subservient in the face of imperialist hegemony. Thus, the Philippine national democratic revolution, while distinct from the socialist revolution, nevertheless looks forward to the latter.

In Guerrero's view, there are three indispensable weapons in the national democratic struggle. The first is the leadership of a 'rectified' or purified Communist Party. The second is armed struggle based on a strategy of 'protracted people's war', wherein a proletarian-led peasant army builds up its strength in the Philippine countryside (which contains 70 per cent of the population) and advances 'wave upon wave' to encircle the urban bastions of the Philippine government. Finally, there is the national united front, which seeks to unite all 'patriotic classes and strata with an objective interest in overthrowing US imperialism and feudalism into a powerful social and political force'.

In the volatile atmosphere of the late 1960s, when the McCarthyist superstructure was breaking down, nationalism was reawakening in student ranks, the Vietnamese people 700 miles away were fighting the mightiest power on earth to a standstill, peasants were demanding land, and workers were marching for higher wages. . . . *PSR* was heady stuff. DGs (discussion groups) organised around *PSR* became the main mechanism for the integration of thousands of students into the ranks of the burgeoning national democratic student and youth organisations which spearheaded the effervescent mass demonstrations that preceded the imposition of martial law on 21 September 1972. In the countryside, *PSR*, translated into different vernacular languages, became the basic course in the political education of peasant recruits into the New People's Army. For mindful of the experience of the PKP, where peasant millenarianism overwhelmed proletarian ideology, the leadership of the CPP and NPA was determined that its peasant cadres would internalise working-class ideology.

In *PSR*, Guerrero warned that, with the increasing intensity of the Philippines' unresolved social contradictions, the ruling class would be increasingly tempted to shift from formal democratic means of control to a more openly repressive, fascist form of state. In September 1972, the Marcos faction of the elite imposed martial law, both to seize absolute power and to freeze the social conflicts which were gradually unravelling the neo-colonial order. By then, however, two of the three basic revolutionary institutions had been re-established: the CPP was set up on 26 December 1968 and the New People's Army was formed with sixty-eight men and thirty-five rifles on 29 March 1969. And during the dark days of the early martial law period in 1973, the third

institution, the preparatory commission for the national united front, the National Democratic Front, was organised in Manila.

Refining the strategy

By 1974, the NPA was operating in twenty guerrilla fronts on the main island of Luzon. It was, however, hard-pressed by encirclement-and-suppression campaigns carried out by the Armed Forces of the Philippines (AFP). Though it was solidly rooted in peasant populations, the NPA was in danger of being ousted by the AFP's superior military force from its two main areas of operation in Cagayan Valley and the Bicol peninsula. It was at this point that the leadership's theoretical skills came to the rescue of the revolution.

Specific Characteristics of Our People's War, which appeared in 1974, posed the fundamental military problem confronting a fledgling guerrilla force battling against the superior resources of the Philippine military: '[W]e have to fight within narrow fronts because the entire country is small and its countryside is shredded.' Amado Guerrero responded with two strategic prescriptions which sought to adapt the Chinese and Vietnamese strategy of people's war to an archipelagic country.

First, the NPA had to create multiple guerrilla fronts throughout the archipelago instead of focusing its energies on creating just one central base area, as Mao did in Yenan. This would have the effect of forcing the enemy to disperse his superior force to several major islands, thus stretching it thinly. Second, it had to exploit the mountainous character of the Philippines to maximum advantage. By skilfully operating from the mountain ranges which 'sew up' and criss-cross the major islands, the NPA could exert political and military influence on the various lowland provinces which bordered each range. The spirit behind these strategic innovations was profoundly dialectical, profoundly Marxist; it was to turn geographic constraints into advantages.

Guided by this strategy, NPA armed propaganda units (APUs) fanned out from Luzon to the other major islands of the archipelago in the mid-1970s. In the early stage of organisation, the bulk of the APU's work was non-military political work, such as popular education, land reform, health delivery, cleaning out local crime, and mass organisation-building. With the formation and deployment of increasing numbers of semi-legal teams (SLTs) to carry out political organisation, however, the APU's mass work became secondary to its

military functions. In Samar, Negros, Panay, and Mindanao, this pattern of patient, solid based-building tested in Luzon was repeated innumerable times: win local confidence, by tackling issues of local concern, expand the people's political consciousness by showing the systemic character of social problems, recruit, build mass organisations, specialise and form regular NPA units. Only when solid organising had been carried out and regular NPA units formed could the latter initiate 'tactical offensives' to gain arms from the enemy on a regular basis.

Mindanao, the country's second largest island, illustrates the explosive potential of the NPA 'formula'. From one APU in 1974, NPA strength grew to twenty full-pledged guerrilla squads spread out over five fronts in 1978. As of 1984, numerous 'undersized companies' or 'oversized platoons' had replaced the squads and were deployed to ten guerrilla fronts covering 2,200 town centres. NPA expansion in Mindanao, by drawing AFP units from other parts of the country, provided much-needed breathing space for expansion and consolidation of NPA fronts in Luzon and the other major islands.

The formation of guerrilla bases is most advanced in Mindanao. In contrast to guerrilla zones, which are contested areas, bases are secure sanctuaries of NPA control which AFP troops either cannot penetrate at all or, if they do succeed, cannot encamp in. CPP and NPA leaders view the bases' political infrastructure, made up of governing committees linking up different 'sectoral' mass organisations, as the local embryos of a future national revolutionary government.

The guerrilla bases also host military training centres for NP, regulars. This function will become increasingly important as the NP, increases its recruitment in response to the heightened tempo of the civil war. CPP-NPA strategists have acquired a reputation for carefully calibrating their advances to their actual or projected strength. Nonetheless, the revolutionary momentum is such that they estimate that the NPA has passed from the early sub-stages to what they term 'the strategic counter-offensive substage of the strategic defensive.' The military concept describes a correlation of forces in which the Marcos army is rapidly losing its strategic advantage nationwide to the NPA. In this developing phase, company-sized NPA units (about a hundred fighters) will become the norm, replacing guerrilla squads as the standard fighting unit, with some advanced beginning to field battalion sized formations by the end of the period. In terms of warfare, the period will see a transition from small-scale guerrilla offensives to the primacy of regular mobile warfare, complemented by guerrilla actions

So extensive is the revolutionary movement's politico-military infrastructure in the countryside that there is widespread confidence that it will be able to pass from the strategic defensive to the 'strategic stalemate'—a status of rough parity with the Philippine military—in three to five years' time.

In a recent interview, the imprisoned José Maria Sison stated that in the next few years, 'at the cumulative rate the NPA is gaining strength, it shall have control or influence over about 50 per cent of the 1500 municipalities in the country and will be able to easily concentrate companies and even battalions to wipe out army units in most of the country.' That this was no idle boast was shown by the recent battalion-sized formations (500 men and women) which staged spectacular arms-gathering raids on AFP command posts and armouries in Western Mindanao and Negros Island.

Painting the expected scenario, Sison continued: 'Right now, the NPA can wipe out or disarm entire army platoons in various parts of the country. In the strategic stalemate stage, the annihilation of enemy companies or battalions in single operations or campaigns will become commonplace. There will be temporary repeated seizures of big towns, provincial capitals, and small cities to wipe out or disarm army units.'

Sison's predictions appear to be rooted in hard military realities. Even now, the real ratio of NPA to army strength is 1:6, a perilously low figure from the perspective of US officials, who consider a 1:10 ratio as the ideal. This is because after one deducts the 20,000 troops deployed against the insurgent separatist Moro National Liberation Front (MNLF) in Western Mindanao, there are only 60,000 combat troops countering the 10,000 NPA regulars with high-powered rifles.

To achieve parity with the army, NPA strategists estimate, according to some reports, that they will need 25,000 regulars. This is seen as within reach. It will entail, among other things, a sharp escalation of attacks on army units and installations to gather arms. Equally important is the laying down of the extensive political infrastructure needed to support a vastly expanded people's army.

Two faces of the same war

The rapid development of the war in the countryside has thrown a new light on the relationship between the armed struggle in the countryside and the legal, semi-legal, and clandestine mass struggles in the cities led and influenced by the National Democratic Front. 'While it is our

principal task to wage a protracted war in the countryside,' Guerrero stressed in *Specific Characteristics* . . . , 'it is our secondary task to develop the revolutionary underground and the broad anti-imperialist and democratic mass movement in the cities.' He continued:

We should excel in combining legal, illegal and semilegal activities through a widespread and stable underground. A revolutionary underground developing beneath democratic and legal or semilegal activities should promote the well-rounded growth of the revolutionary forces, serve to link otherwise isolated parts of the Party and the people's army at every level and prepare the ground for popular uprisings in the future and for the advance of the people's army.

Working under extremely dangerous conditions in the early years of martial law, when the average working career of urban organisers was said to be less than six months before they got too 'hot' and had to be redeployed to the countryside or another city (if they had not already been caught), National Democratic Front organisers had, by 1975, laid the basis for a militant workers' movement. This launched a year-long wave of over 400 strikes which challenged the regime's promise of a docile, strikeless work force to foreign investors. Work among the lower ranks of the Catholic clergy built up a strong network of recruits and supporters in a stratum made receptive to new concepts of Christian social doctrine by Vatican II. Among lawyers, medical workers, teachers, professionals, and students, similar networks of supporters and sympathisers were forged. As in the countryside, the organising principle was the same: champion justice issues of particular concern to a sector, like rises in students' tuition fees; organise and boldly lead mass struggles around these issues and stretch the limits of legality set by the regime; raise political consciousness by linking the various issues as abuses emanating from a system of fascism supported by US imperialism.

By the time of the Aquino assassination on 21 August 1983, the NDF had built up an impressive intersecting array of 'sectoral', 'cause-oriented' organisations cooperating at the legal, semi-legal, and illegal levels. Thus, a great number of the massive, sustained nationwide demonstrations, pickets, and marches which shook the cities in the months after the brazen murder were not simply spontaneous. Sustaining the varied expressions of people's anger was a sophisticated and firm scaffolding that had been creatively and carefully constructed over the previous decade.

Many of the five hundred or so cause-oriented sectoral organisations

nationwide are influenced by the NDF and they provide it with a strong base with which to negotiate alliances with other parties in the urban opposition. One such broad alliance, the recently established Bayan coalition led by former Senator Lorenzo Tañada and supported by the cause-oriented groups, is seen by many as a major effort to formalise a broad united front with diverse class forces.⁵

Urban mass actions now have a direct relationship to the armed struggle. Intensified urban protest, by drawing army forces from the countryside, takes the heat off NPA units working in adjacent rural areas. And, when breathing space is needed to accelerate urban organisation, the NPA steps up its tactical offensives against the Marcos troops, forcing the latter to request assistance from urban garrisons.

The City of Davao, the Philippines' third largest, has become the major experimental area for the direct coordination of open mass actions by urban sectoral organisations, clandestine urban guerrilla warfare by 'armed city partisan' units (ACPs), and NPA tactical offensives carried out in the rural outskirts of the metropolis. As one NDF leader put it, 'The armed struggle in the countryside and the people's struggles in the cities are two faces of the same war.' The influence of the 'Nicaraguan model' on a revolutionary movement that puts a premium on absorbing new lessons and innovating is obvious.

Self-reliant revolutionaries

The capacity to absorb, experiment, and innovate is related by many observers, including the US Senate Foreign Relations Committee staff, to a principle of organisation laid out in *Specific Characteristics* . . . : 'centralised leadership and decentralised operations'. This was prompted by the need, under conditions of archipelagic guerrilla warfare, for cadres

who are of sufficiently high quality to find their own bearing and maintain initiative not only within periods as short as one or two months . . . but also within periods as long as two or more years, in case the enemy chooses to concentrate on an island or a fighting front and blockade it.

With the premium placed on self-reliant local units, CPP and NPA training has stressed the development of strong ideological commitment as well as rigorous internalisation of dialectical methods of

Bayan, however, has suffered lately from the departure of some middle-of-the-road parties and personalities, like the nationalist former senator, José Diokno.

analysing, breaking down and resolving problems. Every cadre, in short, is expected to be a leader, and the sort of blind unthinking loyalty to the party leadership that was cultivated by the PKP is strongly discouraged not only as undemocratic but also as disastrous in the conduct of revolutionary war.

Trained to trust the method of analysis instead of relying on mere authority, the CPP and NPA are said to enjoy a vibrant inner party democracy that would be the envy of other Leninist organisations, where the organisational principle of democratic centralism has been severely skewed on the side of centralism, and democracy has been replaced by bureaucracy.

Sympathetic observers have frequently remarked on CPP members' faith that a collective tackling of a problem 'all-sidedly' with dialectical methodology can arrive at the right line. Periodic 'criticism and self-criticism' is meant to toughen the 'class stand' and to hone one's grasp of theory and method. Advancement to positions of greater responsibility depends on theoretical and organisational competence as well as firmness of class stand, all of which are assessed by an individual's different present and past collectives.

The principle of self-reliance and the cadres' internalisation of 'scientific method' has enabled the CPP and NPA to absorb body blows which have crippled bureaucratic Leninist parties. Whereas the Huk Revolution never recovered from the capture of the PKP Secretary General and most of the 'Politburo-In' in October 1950, the NPA insurgency has kept expanding despite the arrest of over half the Central Committee of the CPP in the mid-1970s. Well-trained subordinates capable of thinking on their feet simply stepped into the roles of those captured, and the arrest of some of these successors simply led to others filling their shoes.

Thus, Marcos' celebrated boast in 1977 that the 'back of the Communist insurgency was broken' with the capture of many of its original leaders was swiftly shown to be the illusion of a dictator who failed to discern the true character of his revolutionary antagonists. For the dictator and his US backers, the revolution has become a hydra-headed creature which cannot be decapitated.

Conclusion

The armed revolution launched by the CPP and the NPA has entered its

seventeenth year, with its leaders cautiously confident of gaining the strategic initiative *vis-à-vis* the government in a few more years. There continue to be major obstacles on the path to a successful completion of the national democratic revolution. For one, there is the question of arms. More youth want to join the NPA than can be accommodated because of the lack of arms, say movement sources. While increasing arms-gathering raids on the AFP will probably meet the demands of firepower for a few more years, this method will soon prove inadequate. The shift to regular mobile warfare on the plains of Luzon and Mindanao when the correlation of forces reaches the strategic stalemate and the NPA moves to the strategic offensive will demand a larger and more stable flow not only of small arms but also heavy weaponry, like howitzers and mortars. Should the NPA try to procure its arms from external sources, it will have to contend with the likelihood of a naval blockade by the US Seventh Fleet.

Then, there is the looming threat of direct US intervention should the demoralised AFP collapse. While American public opinion at present will probably not sanction the sending of ground troops, the strength of the 'Vietnam Syndrome' a few years hence cannot be taken for granted, especially with the continuing rightward motion of the US electorate. But if the past is any indication, we should expect the revitalised Philippine left to produce innovative responses to these and other constraints and threats.

Rarely has a revolution suffering a strategic defeat recovered in the period of time it took the Philippine revolution to revive and move once again to a position of relative strength. It took fifteen years to move from devastating defeat in 1954 to the re-establishment of the CPP in 1968 and the founding of the NPA in 1969. And it has taken 16 years for the NPA to grow from a hardy band of 68 men to a nationwide force of 15,000 regulars who are pressing the AFP to a debilitating stalemate.

The works reviewed here contribute significantly to an understanding this phenomenon. In conclusion, two factors appear especially decisive. One is the CPP and NPA's capacity to fuse revolutionary discipline with strong initiative from cadres at all levels of the movement. The other is the consistent employment of theory to illuminate practice and chart out the road to state power. All the key junctures in the revitalised left's history—the forging of the programme of the National Democratic Revolution, the struggle leading to the re-establishment of the party in 1968, the adoption of the archipelagic guerrilla strategy in the mid-1970s, the interaction of the advancing rural armed struggle, the united

front in the cities, and the urban mass protests in the mid-1980s—serve to illustrate the continuing relevance of Lenin's assertion: 'Without revolutionary theory, there can be no revolutionary practice.'

North-South Monitor

THE UN SYSTEM

▲ UNCTAD Special Committee on Preferences

Thirteenth Session

Geneva, 10-19 April 1985

■ For the first time in five years, seventy-seven countries in all regional groups within the Special Committee on Preferences agreed on the conclusions of their periodic review of the Generalised System of Preferences (GSP). The GSP was established by UNCTAD II in New Delhi in 1968 to give preferential access to developed country markets for specified products from designated developing countries.

The committee, which monitors implementation of the GSP, recognised the important role of the GSP as a mechanism for facilitating developing-country exports and expanding international trade. In 1982, trade covered by the system amounted to \$32bn. The committee reaffirmed the objectives and character of the GSP, especially its generalised, non-discriminatory and non-reciprocal nature. Its role in the development efforts of developing countries was recognised, the aims being to increase their export earnings, promote their industrialisation and accelerate their rates of economic growth. These objectives had not, however, been fully achieved. In particular, the expansion of the exports of indebted countries was seen as a means of maintaining their development momentum while simultaneously allowing them to service their debts.

The committee expressed satisfaction that all the GSP schemes requiring renewal had been extended beyond their initial ten-year period. (The US and Canada had made their extensions in 1984.) It was noted that the improvements made in the system in recent years had been relatively modest, and developed countries were urged to consider products not yet adequately covered in both the agricultural and industrial sectors, with a view to improving product coverage. Special measures were advocated to give benefit to the least developed countries. The committee also agreed that the rules of origin, defining the products to be covered by the GSP, should be liberalised and harmonised and their operation simplified. Governments, especially those of preference-giving countries, were moreover urged to contribute to the UNCTAD Trust Fund in order to enable multilateral technical cooperation to proceed beyond 1985.¹

The committee had also noted the request of preference-receiving countries to respect the character of the GSP and refrain from excluding beneficiary countries. It had urged preference-giving countries envisaging modifications of the scheme to afford upon request adequate scope for prompt consultations over difficulties. Both these clauses reflected major concerns on the part of developing countries that some beneficiaries were being graduated out of schemes once they had attained a given per capita income and that such decisions were being made without reference to the views of preference-receiving countries.

Alister McIntyre, UNCTAD's Deputy Secretary-General and Officer-in-Charge.

North-South Monitor

suggested that many factors had to be taken into account in determining eligibility for preferential access rather than the simple indicator of GNP per capita. Product-specific criteria might be necessary or a country might have achieved an adequate level of competitiveness in one sector and not in another. Moreover, there should be no penalty for countries developing into competitive exporters, he said. He considered that the rules for modifying GSP schemes should be based on criteria evolved through multilateral consensus.

These criticisms of the GSP had been echoed by Ahmad Saker of Syria, speaking for the Group of Seventy-Seven (G77); he argued that the system was being undermined. Countries were, he said, arbitrarily deprived of beneficiary status for political reasons or if they began to demonstrate the capacity for competitiveness. Those determining that this status had been reached were often, he said, exclusively the developed countries. He expressed concern over the introduction of income thresholds and demands for reciprocal concessions in new US schemes and also advocated the expansion of product coverage, tariff cuts and the liberalisation of non-tariff barriers in the schemes.²

● Contrary to popular superstition, the 13th session has proved to be a lucky one and we have reached agreed conclusions on a number of important aspects of the GSP'. Marie Plate of the Netherlands, spokesperson for the OECD countries, International Foundation for Development Alternatives, *Special United Nations Service* (Geneva) No. 123, 21 April 1985.

Speaking on behalf of the G77, Ahmad Saker of Syria hoped that the agreed conclusions would be 'only the beginning of a constructive approach, the start of a process which will affect the minds and attitudes of those responsible for implementing the GSP'. International Foundation for Development Alternative *Special United Nations Service* (Geneva) No. 123, 21 April 1985.

▲ UNESCO

One Hundred and Twenty-First Executive Board Meeting
Paris, 9 May–21 June 1985

■ UNESCO's fifty-member Executive Board made attempts to resolve the crisis within the organisation caused by the UN's withdrawal in December 1984. Britain contributing 5 per cent of UNESCO's budget, compared with the US's 25 per cent was also threatening to follow suit unless reforms were carried out.

A joint statement formulated at Luxembourg by the European member-states to UNESCO was presented to the Executive Board.³ It called for cuts in the 1985 budget; a comprehensive plan and timetable for the implementation of administrative reforms; and plans for the 1986/87 UNESCO programme. Even France (hitherto an exception amongst Western industrialised states in supporting the agency and its Director-General, Amadou Mahtar M'Bow) had begun to harden its attitude.⁴ However, the Board crossed off its agenda a report critical of UNESCO's management, which Western nations had wanted to be considered. Entitled 'Improvements needed in UNESCO Management, Personnel, Financial and Budgetary Practices', it had been written by the US General Accounting Office

North-South Monitor

in 1984, prior to US withdrawal. It was rejected, ostensibly on the grounds that it had not been translated.⁵

The meeting adopted by consensus a precise and detailed timetable, drafted by the thirteen-member Temporary Committee of the Board, for the implementation of more than a hundred previously agreed reforms. These measures concerned the decentralising of UNESCO's activities; the improvement of its budget and recruiting practices; improved evaluation methods for its programmes; and the strengthening of its governing bodies, the Executive Board and the Conference. The Board also endorsed the Director-General's recommendation to proceed with the remainder of the programme for the 1984/85 biennium, despite the US withdrawal and the withholding of its \$43m contribution. The 1985 budget shortfall was, accordingly, to be made up through \$25m worth of economies, \$8m of voluntary contributions⁶ and the controversial mobilisation of \$10m of the UNESCO budget earmarked to meet inflationary rises in costs. While the industrialised countries (with the exception of France, which endorsed M'Bow's proposal) warned that the manoeuvre was probably illegal under UNESCO's rules, they agreed to await the final ruling on the subject by the full UNESCO Conference in Sofia, in October 1985. In the meantime, the Director-General was authorised to seek active negotiations with the US to settle the dispute over its outstanding contributions. This plan was made despite calls by developing countries for a decision on the matter to be sought from the International Court of Justice in the Hague.

The Executive Board went on to consider a draft programme and budget for the 1986/87 biennium. Although the Director-General had suggested a 'zero-growth budget', the Western 'pro-reform' countries succeeded in securing the principle of reducing the budget by the 25 per cent lost as a result of US withdrawal. The question was how the programme was to be adjusted to accommodate these cuts. The Western industrialised countries favoured what they termed 'programme concentration', entailing the elimination of those programmes they opposed on the grounds of their being 'controversial', 'politicised' or 'overlapping', such as those concerning disarmament, communications or human rights. On the other hand, many developing countries, as well as the Soviet Union, favoured across-the-board cuts, affecting all programmes equally. After six weeks of debate, a consensus formed around an overall programme with a limited reduction in politically contentious areas and a slight shift in favour of scientific and technical fields. The communications programme was to involve more aid to specific countries, and for training journalists, and less emphasis on the 'democratisation' of information. Less stress was to be placed on the technical aspects of disarmament, and more on its educational dimensions. Practical assistance towards the eradication of illiteracy was to be offered by UNESCO, rather than the subject itself being studied.

While the sum of these reforms was deemed insufficient to persuade the US to reconsider its withdrawal from the organisation, it received the cautious approval of other Western states. The British representative, William Dodd, stressed that the Board was competent to make recommendations only, and that Britain would be waiting the results of the General Conference in Sofia before making a decision on its position. It was understood that Britain considered the proposed reforms to be inefficient, but was hoping for their extension at the conference.⁷

UNESCO must 'avoid a politicisation of discussions which, as the present crisis

North-South Monitor

shows, can only lead to confusion, perhaps even to the disappearance of the organisation.' Roland Dumas, French Foreign Secretary, in a speech prior to the opening of the Board meeting. *The Times* (London) 18 April 1985.

The outcome of the meeting was 'a major success'. Gisèle Halimi, French permanent delegate to UNESCO. *Financial Times* (London) 22 June 1985.

'Never before in the history of UNESCO have so many reforms been initiated in so short a time.' Ivo Margam, Yugoslav delegate to UNESCO and Chairman of the Temporary Committee. *The Times* (London) 5 June 1985.

▲ Commission on Transnational Corporations (TNCs)

Reconvened Special Session

New York, 17-21 June 1985

■ Eighty-one UN member-states met to examine a study prepared by the UN Centre on Transnational Corporations, with a view to overcoming the current deadlock on the Code of Conduct for TNCs. The study concerned the outstanding issues in the draft code of conduct, which have divided the commission.⁸ These issues relate to international law and legal obligations, and their implications for nationalisation; state contracts; non-discrimination and fair and equitable treatment; national treatment; free choice of law and means of settling disputes; non-interference in internal matters; conflict of jurisdiction; free transfer of payments relating to TNC investments; non-collaboration by TNCs with the South African regime; and the objectives of the code.

It was decided, subject to the approval of ECOSOC and the UN General Assembly, to reconvene the Special Session for two weeks in January 1986, in order to reach agreement on these outstanding issues, and to complete the code. It was suggested that expert advisers be invited to attend the January session and that the Secretary-General review and revise the report presented to the June 1985 Session.⁹

▲ UN Conference on Conditions for the Registration of Ships

Third Session

Geneva, 8-9 July 1985

■ One hundred delegations from large shipowning states, developing and socialist countries attended the session.¹⁰ They agreed on the conditions that should govern the inclusion of merchant ships in national shipping registers, thus reaching the first international agreement to specify the components of the 'genuine link' which is supposed to exist between a ship and the flag it flies. In 1984 roughly 30 per cent of shipped merchandise was carried under the flags of convenience or so-called 'open registries' such as Liberia, Panama, Cyprus, Bermuda and the Bahamas.

The three conditions for the registration of ships adopted by consensus concerned ownership, management and manning, the latter two proving the most controversial in previous sessions. Flag states were to make appropriate provisions for the participation of their nationals as owners of the ships they registered. The level of participation was to be sufficient to allow the flag state effective jurisdiction and

North-South Monitor

control over those ships. Shipowning companies were to be established with their principal business premises in the flag state or at least were to contain a representative or management employee who was a national of or domiciled in that state. A 'satisfactory part' of the crew of merchant ships were to be nationals of the flag state or domiciled or permanent legal residents there. Qualifications to this rule however would include factors such as the availability of qualified seafarers in the flag state, legally valid bilateral or multilateral agreements and considerations relating to the economic viability of operating the ships. Other provisions in the new agreement included those of maritime administration, identification and accountability and measures to protect the interests of countries supplying labour to merchant ships.¹¹

A key point among the conditions of registration was the obligation of each flag state to ensure that the managers and operators of its ships were capable of meeting the financial obligations arising from the ships' operations. Their nationals in the management of the shipping companies were also to be available for legal procedures. The purpose of the new regulations was to make the owners and operators of ships identifiable and responsible for accidents, with their flag states as the ultimate guarantors of that responsibility. The President of the conference, the Ivory Coast's Marine Minister, Lamine Fadika, stressed that flag states would be held liable for financial compensation in cases of third-party damages. It was hoped that the new regulations would end the abuses entailed in flags of convenience: the exploitation of crews (often from developing countries) through low wages and bad conditions, the ignoring of international rules on hygiene and marine pollution, and tax fraud as well as the evasion of responsibility for accidents.

All groups at the conference declared themselves satisfied with the agreement and a fourth session was planned for the beginning of 1986. Its chief purpose will be to determine the legal form the agreement should take. Lamine Fadika reported that a majority of states favoured a mid-way position between the extremes of a legally binding convention and non-binding recommendations. Under this compromise some clauses would be mandatory and others optional.¹²

● 'It is not directed against any country or any group of interests. It forms a well-balanced whole. It takes into account both the interests of developing countries with legitimate aspirations to improve their situation in shipping and the no less legitimate concerns of industrialised countries, of developing countries that supply manpower, or landlocked countries who want to have a merchant fleet under their flag, of open registry countries whose economies are based to a large extent on this system, and, finally, the interests of the crews, both officers and seamen'. Lamine Fadika, Minister of Marine of the Ivory Coast and Chairman of the Conference in his concluding statement to the plenary. *UNCTAD Press Release*, TAD/INF/1708, 22 July 1985.

North-South Monitor

▲ World Conference to Review and Appraise the Achievements of the UN Decade for Women
Nairobi, 15–26 July 1985

■ The UN Conference met with the dual purpose of reviewing the past achievements of the UN Decade for Women, whose end it marked, and of devising new strategies for improving the status of women in the remainder of the century. Overlapping with the non-governmental 'Forum '85', held in Nairobi from 10–19 July 1985, in which over 11,000 women from 150 countries participated, it was attended by delegations from 157 countries, all of which contributed to the final document on 'Forward-looking Strategies'.

The conference participants took note of some marginal improvements in the years from 1975–85, such as those in education, particularly within developing countries, where girls increased from 37 per cent to 41 per cent of the secondary school population during the decade. In manufacturing industry the wage gap had narrowed, with women earning 73 per cent of men's earnings compared with 70 per cent ten years ago. Within developing countries, awareness of the need for family planning and the demand for contraceptives was also said to have increased during the decade. It was recognised, however, that for many women conditions had not improved, but had worsened because of the economic recession. One marked achievement of the decade had been in the field of research, which had made available some of the statistics representing women's subordinate status. The UN study, 'State of the World's Women' (1985) revealed that 'while women represent fifty per cent of the world's population, they perform nearly two-thirds of all working hours, receive only one-tenth of the world's income and own less than one per cent of world property.' This statement, Leticia R Shahani, UN Assistant Secretary General argued, remained as appropriate in 1985 as it was when it was first made in 1980.

The final document, 'Forward-looking Strategies of Implementation for the Advancement of Women and Concrete Measures to Overcome Obstacles to the Achievement of the Goals and Objectives of the Decade', was drafted within two committees working simultaneously. Its passage was hampered, however, by disagreements between, on the one hand, Western states led by the US and, on the other hand, developing and socialist countries. The US had insisted from the outset that its delegation, led by Maureen Reagan, daughter of the US President, would oppose the intrusion into the conference of what it termed extraneous political issues. These issues included those of disarmament, apartheid, the creation of a Palestinian state and Zionism, the discussion of the latter having deterred the US from signing the final documents of the previous women's conferences in Mexico City in 1975, and Copenhagen in 1980. Delegations from developing countries had argued, however, that the avowed goals of the Women's Decade (equality, development and peace) could not be achieved unless these issues were addressed, and that the condition of women could not be improved unless unjust political systems were radically changed.¹³ It was because of this division that the US had insisted initially on any final document being adopted by consensus. This requirement could have given the US the power to block decisions in the conference, of which developing and socialist countries formed the majority. Following an early US compromise, however, when it was decided that the report 'should be adopted by consensus', rather than 'must be', certain sections of the report were voted on in

North-South Monitor

plenary session, as no agreement could be reached on them in committee. At this stage, in the final plenary session, the US delegation, supported by Israel and Western states, refused to accept a particular paragraph equating Zionism with racism, which would almost certainly have been passed had a vote been taken. A possible walkout was averted by a compromise wording suggested by the Kenyan delegate, in which 'all forms of racism' were decried. The US accepted the wording on the basis that Zionism was not included in the description, and the PLO representatives accepted it on the grounds that the UN had characterised Zionism as a form of racism in previous decisions.

The final document was adopted as a whole by consensus, with 4 of the 372 paragraphs being put to the vote. A proposal of G77 to the effect that coercive measures adopted by certain developed states, including trade restrictions and economic sanctions, had adverse effects on the integration of women in development, was adopted by 109 votes to none, with 29 abstentions. A further paragraph attributing the unequal position of women in large part to the unwillingness of certain developed countries to help to implement the New International Economic Order was passed by 103 votes, with 1 against (the US) and 29 abstentions. A paragraph on the situation of women and children in South Africa, which called among other things for sanctions against South Africa, was passed by 121 votes, with 1 against (the US) and 13 abstentions. Finally, a paragraph on Palestinian women and children, calling for the achievement of Palestinian rights, as formulated in the UN Programme of Action concerning Palestine, was passed by 97 votes to 3 (Australia, Israel, and the US), with 29 abstentions.

Despite fears that the conference would be overtaken by such issues, it was widely recognised as having achieved a certain unity of purpose, and as having withstood attempts to deflect it from its major concerns. The plight of rural women in developing countries received attention; reports estimated that women produce 50 per cent of the world's food and perform between 60 and 80 per cent of Africa's farm work. In view of these facts, and of widespread drought and famine in Africa, the targeting of development assistance to women was seen not merely as a humanitarian gesture, but as a necessary means of improving vital food production. The final document called for improved training for women in food technologies, and for their improved access to land, capital, technology and other resources, through land ownership and inheritance rights, and for the removal of restrictions on their access to credit. Water was also an issue, with governments being urged to 'relieve the burden placed on women by the task of fetching water', by constructing more dams and wells.

The document called on all countries to enforce the existing laws providing for the equality of women, and to advance their training and education, particularly in technical, managerial and non-traditional areas. It advocated their increased participation in trade unions, political parties, and the military. It urged governments to place an economic value on the unremunerated work of women in bearing children, keeping house and raising crops, advocating the legal implementation of parental leave policies and the encouragement of the sharing of household work and child care between men and women. A provision, opposed by the US, also asked governments to ensure that both sexes received 'equal pay for work

North-South Monitor

of equal value'. In addition to provisions on family planning and violence against women, special attention was given to women whose specific situations exacerbate their plight, such as those in areas of armed conflict; single-parent families; disabled women; women who are victims of sex trafficking or involuntary prostitution; refugee women; Palestinian women; and women under apartheid.

While the final document was not legally binding (a fact stressed by the US delegation when it was argued that many of its provisions ran counter to US policy) it was considered by some participants to be a useful instrument of pressure to apply to recalcitrant governments. Going far beyond the existing state of legislation in most countries, it was designed for immediate action, the strategies' implementation being monitored every five years, depending on the decision of the UN General Assembly. Each country was to have the option, however, to determine its own priorities, based on its own development policies and resource capabilities.¹⁴

▲ UN Convention on the Law of the Sea (UNCLOS)

Preparatory Commission for the International Sea-Bed Authority and the International Tribunal for the Law of the Sea
Geneva, 12-14 September 1985

■ During its summer session the Preparatory Commission, which meets twice a year, made marginal progress towards the establishment of rules and regulations governing the exploration and exploitation of sea-bed resources in international waters.

A focus of debate was the reported unilateral granting of licences, in November 1984, by the US to four mining consortiums to extract manganese nodules from the Pacific.¹⁵ This action on the part of the US, performed without notifying the Preparatory Commission, was unanimously opposed during the meeting. The

North-South Monitor

Pakistani delegate, Mansur Ahmad, argued on behalf of the Group of 77 that it contravened the principle enshrined in UNCLOS that sea-bed resources are a common heritage of mankind, thus undermining the convention. On the recommendation of G77, the Preparatory Commission declared that 'any claim, agreement or action regarding the [international sea-bed] area and its resources undertaken outside the Preparatory Commission which is incompatible with the United Nations Convention on the Law of the Sea and its related resolutions shall not be recognised.' It unequivocally declared such arrangements to be 'wholly illegal' and denied that they were a basis for the creation of legal rights.

The Commission continued its examination of the procedural rules of the Assembly and Council of the International Sea-Bed Authority (ISA) in preparation for the entry into force of UNCLOS, which would occur after sixty state ratifications. (At the time of the meeting, twenty-two states had ratified the treaty.)¹⁶ The Chairman of the Commission, Joseph Warioba of Tanzania, also continued his consultations on the resolution of overlapping claims to international sea-bed areas by applicants for 'pioneer investor' status. Until these conflicting claims were resolved, the Preparatory Commission could not, he said, implement Resolution II of the Third UN Conference on the Law of the Sea by elaborating rules on the registration of pioneer investors.

There were reports during the session from the four special commissions of the Preparatory Commission. Special Commission 1, mandated to study possible ramifications of deep sea-bed mining for land-based mineral producers,¹⁷ was reported to have gathered sufficient data for its purposes. Future studies, its Chairman suggested, might concentrate on the existing programmes and activities of international and multilateral organisations in order to assess their suitability for assisting land-based producer states; the influences of various factors (such as population, per capita income, geographical location) on the level of dependence of particular countries on the minerals involved in deep sea-bed mining; and the role of these mineral sectors in the economies of particular developing countries which are land-based producers.

Special Commission 2, set up to establish the Enterprise (the sea-bed mining organ for the ISA), examined a working paper outlining hypothetical deep sea-bed mining operations, in order to consider the possible requirements in terms of skilled managerial personnel. In formulating such hypothetical models, the Chairman suggested that the Special Commission would have to take into consideration metal prices and markets in the short and medium terms; the access of the Enterprise to these markets; the cost of marketing; and the availability of facilities such as processing plants for leasing. The Special Commission also agreed in its calculations to assume that the Enterprise would be the sole operator initially, though its first operation might in reality be a joint venture. It was thought that the training of experts for the ISA might be a more immediate need than the training of people in the practical skills of sea-bed mining.

Special Commission 3, mandated to devise the mining code, considered a set of draft regulations concerning the procedure for states to notify the ISA of their intention to prospect; application for approval of exploratory and exploitative operations; and the criteria for that approval.

Special Commission 4, to establish the International Tribunal for the Law of the

North-South Monitor

Sea, continued to obtain information on the experience of other organisations (such as the UN) in the setting up of such courts and tribunals. In most cases, temporary facilities had been used to avoid delays during the construction of permanent buildings. The Special Commission also continued its examination of draft procedural rules for the tribunal, and discussed provision in UNCLOS for the prompt release of vessels and crews, of particular importance to shipping and coastal countries.¹⁸

COMMODITIES

▲ International Cocoa Organisation (ICCO)

Council Meeting

London, 8–19 July 1985

■ Two weeks of talks between producer and consumer countries in the Council ended without agreement on a successor to the International Cocoa Agreement, which was due to expire in September 1985. Like the last negotiations on a new agreement, in Geneva in February–March 1985, the talks collapsed over the issues of price-structure and the regulation of stocks.¹⁹

In the July talks, consumer countries were pressing producers to agree to a statement effectively linking the extension of the current pact with their acceptance of a substantially lower price range in any future agreement. The Soviet Union, in particular, took an unexpectedly hard line, threatening not to agree to extend the pact unless the price range was cut, and pressing for the suspension of levy payments to finance the buffer stock. Eventually, however, the Council agreed to extend the present International Cocoa Agreement for a further twelve months from 1 October 1985, a decision on which the Soviet Union abstained. The Council then decided to make a fourth attempt to negotiate a new pact, in Geneva in February 1986.²⁰

▲ International Coffee Organisation (ICO)

Executive Board Meeting

London, 22–26 July 1985

■ The sixteen-member Executive Board proved unable to settle the outstanding issues of the ICO's price support arrangements, and penalties for discounting to non-ICO members.

On the question of price support, a fall in the fifteen-day moving average indicator price to just below 130¢ per pound had automatically triggered a reduction of 1m bags (60 kilogrammes each) in the ICO export quota, on 3 July 1985, to 59.2m bags. (The global export quota is the ICO's tool for controlling supplies and maintaining coffee prices within the support range of the International Coffee Agreement (ICA), currently between US\$1.20 and US\$1.40 per pound.) A further automatic reduction in export quotas was expected within a few days of the meeting's close, as the average price fell below 120¢ per pound.²¹ Hoping to push prices up to the central level in the

North-South Monitor

support range (130¢ per pound), producing countries argued for a further reduction in the export quota, beyond the 1m bags expected. The price slide, they said, had been caused by the excessively large 61m bag quota fixed for the 1984/85 coffee year, ending in September. Arguing that a third cut in the export quota might soon be necessary to maintain prices within the support range, they urged a change in the rule limiting the number of automatic quota reductions to two per quarter, and requiring that changes beyond these be approved by a special meeting of the Executive Board. Consumer countries resisted these moves, however, objecting that the current weakness in the market was merely a corrective to the excessively high prices in the spring of 1984, when the 1983/84 export quota had almost been equivalent to demand.

The issue of discounted sales to non-ICO members, and the related problem of some of these coffee sales never reaching their ostensible destinations (possibly finding their way instead to consumer countries belonging to the ICO), had been discussed at length at previous ICO meetings in April and May 1985.²² At their July meeting, producing countries, with the exception of Indonesia (the chief discounting exporter), agreed on a proposal to penalise abuses of the ICA. Led by Brazil, they stipulated specific penal quota reductions for members who were unable to account for an above-average quantity of coffee sold to non-members, which presumably never reached its alleged destination. The proposal, however, was not accepted by the Board.

Decisions on the issues of price support and discounting were postponed until the ICO annual meeting in September 1985.²³

▲ICO

Forty-fourth annual Council meeting
London, 16-30 September 1985

■After over two weeks of negotiations and three days of extensions, the Council reached agreement on the global export quota and price support range for the coffee year 1985/86. The prolongation of the meeting was in part due to the insistence of some consumer countries that the issues on non-fulfilment of quotas and discounting to non-ICO members be settled before the discussions could proceed.

The US (which accounts for 25 per cent of the world's coffee consumption) was reported to have taken a tough stand with regard to what it termed the under-shipment of producer countries' individual export quotas. This failure to meet agreed export quotas had, it was argued, resulted in artificial shortages during the earlier part of the 1984/85 coffee year precisely when demand was at its highest. The US was consequently anxious for assurance that export quotas for 1985/86 would be fulfilled and discussion of other matters was initially made conditional on the reaching of a settlement on under-shipments. Three proposals for rewards and penalties concerning quota fulfilment proved unacceptable to the Council. Producer countries argued that under-shipment, far from being a result of producers' reluctance to fulfil their quotas, was often caused by irregular trade patterns or lack of demand from ICO consumers.

North-South Monitor

A decision on figures for the 1985/86 coffee year (set to begin on 1 October 1985) was reached by majority vote on a proposal from leading producers. Sixty-one of the ICO's seventy-five members agreed to the proposal, while the US alone voted against it and Costa Rica, Honduras, India, Indonesia and Peru abstained. The initial global export quota was fixed at 58m bags (slightly lower than that year's initial figure of 61m bags). The price support range was to remain unaltered at \$1.20-\$1.40 per pound. The agreement provided for three possible cuts in the export quota of 1m bags each in the event of the price falling below 120¢ pound after twenty days, if it remained below 120¢ for a further fifteen days and if it subsequently fell below 115¢.

The head of the Brazilian negotiating team, Alberto Leite Barbosa, concluded that the agreement, with its quota of 58m bags, would support stable prices and provide a normal flow of coffee. The US, however, having unsuccessfully opposed the agreement and having achieved no gains on either under-shipment or discounting was reported to be reassessing its position with regard to the ICA.²⁴

● 'We are concerned that the outcome may not bode well for the future of the International Coffee Agreement or our participation in it'. Rollinde Prager, head of the US delegation. *IHT* (Paris) 3 October 1985.

'All efforts were made not to leave the United States isolated'. Alberto Leite Barbosa, head of the Brazilian negotiating team. *IHT* (Paris) 3 October 1985.

▲ International Natural Rubber Organisation (INRO)

Special Session of the Council

Kuala Lumpur, 13-14 August 1985 and 3 September 1985

■ After heated discussion, the Council decided to cut intervention prices for rubber by a full 3 per cent, as is provided for under the International Natural Rubber Agreement (INRA). The special session of the Council had been called to review buffer-stock operations, as is required by the regulations when the stockpile (purchased in order to maintain prices) exceeds 300,000 tonnes, a figure it reached in July 1985.

Agreement was reached among INRO's thirty-three members only after a proposal by Malaysia to suspend buffer-stock operations and allow prices to find their own level had been rejected by consumer countries. They saw the suggestion as a tactic to delay the lowering of prices necessary in the face of over-supply. Malaysia was seeking a thorough review of the entire rubber situation and of Article 32 of INRA, which provided for three courses of action in the event of a 300,000 tonne buffer-stock level: an automatic 30 per cent cut in intervention prices; a slower rate of buying by the buffer stock manager; or the suspension of buffer stock operations. As a compromise, the Council, having decided on the 3 per cent cut, agreed to Malaysia's suggestion to review the situation of natural rubber (including its price structure) at its next meeting in October 1985, with the help of a market assessment paper to be prepared by the INRO Secretariat.

The Council also discussed means of financing an additional contingency stockpile of 150,000 tonnes, to be set up once the buffer stock exceeded 400,000 tonnes; the feasibility of INRO's borrowing from commercial banks to finance the stockpile; the

North-South Monitor

legal implications of using its assets as collateral; and the possible guaranteeing of these loans by member governments.²⁵

At a special meeting on 3 September, the Council appointed a new buffer-stock manager to succeed the incumbent, Harvey Adams, who was leaving in October. The appointment of Aldo Hofmeister, a US citizen, ended six months of deadlock over a choice of manager, successive US nominees having previously been rejected.²⁶

DISARMAMENT

▲ Soviet Union–United States Arms Control Negotiations: Second Round Geneva, 30 May–16 July 1985

■ The second round of bilateral negotiations on nuclear and space weapons began as the first round had ended, in deadlock. No changes in the position of either the Soviet Union or the US had been signalled in the recess between rounds, and the two sides were in agreement only in their assessment of the first round of talks as 'fruitless'.²⁷ While no tangible progress was achieved in the second round, various ideas were 'floated' informally, as a means of gauging the unofficial reaction of the other side.

The major point of disagreement in the talks in March and April 1985 had been that the Soviet Union insisted that the Reagan administration's Strategic Defense Initiative (SDI) be halted as a precondition for arms reductions in other areas, while the US repeated that SDI was non-negotiable. Moreover, on 26 June 1985, during the course of the second round, Mikhail Gorbachev explicitly accused the US of blocking the Geneva negotiations in order to continue to build up its arms on earth, at sea and in space. He warned that the Soviet Union would be forced to revise its attitude towards the whole talks if the delaying tactics persisted.²⁸ In a further statement on 5 July 1985, Gorbachev described the 1972 Anti-Ballistic Missile (ABM) Treaty as the 'key link in the entire process of nuclear arms limitation', declaring that it was threatened by the US plans of 'space militarisation', and urging the US to reaffirm its commitment to the treaty.²⁹

Notwithstanding the deadlock over space and defensive weapons, reports emerged of a nascent Soviet flexibility on the issue. According to US officials, as reported on 8 July 1985, Soviet negotiators in Geneva had informally suggested that they might be seeking a ban only on the development and testing of space weapons, as opposed to the elimination of laboratory and scientific research.³⁰ A change in the formal Soviet negotiating position was, however, flatly denied by both sides. Yuli Kvitsinsky, the chief Soviet negotiator on space weapons, instead reaffirmed the Soviet position that a ban on space research was (contrary to US assertions) scientifically verifiable by means of satellite surveillance, and was therefore a coherent goal of Soviet policy.

Tentative developments in the field of strategic arms control left the US negotiators marginally more optimistic at the end of the second round, despite the

North-South Monitor

vague nature of the new proposals. On 24 June 1985, in spite of an agreement on confidentiality regarding substantive details of the negotiations, Paul H Nitze, senior US arms adviser, revealed the formal Soviet presentation of a proposal advanced publicly by Gorbachev on 26 April 1985. This Soviet offer of a mutual 25 per cent cut in strategic nuclear delivery vehicles (expressed in April as being conditional on the elimination of SDI) was rejected by the US on the basis that it referred only to launchers, and not to effective destructive power, measured in the number and size of warheads.³¹

On 10 July 1985 the first indication that Gorbachev's offer might cover warheads, not simply launchers, was given by Colonel General Nikolai F Chervov, head of arms control for the Soviet General Staff, in informal talks with a New York Democratic Congressman. Conditions were attached by Chervov, such that each side would be free to cut missiles, bombers and submarines as they saw fit; ceilings would also cover US long-range bombers and nuclear-capable bombers based in and around Europe; and French and British nuclear forces would be included. US officials, however, denied that any formal representation to that effect has been made in Geneva.³² Later, on 24 July 1985, US officials reported that in a semi-formal post-plenary session at Geneva, a Soviet proposal had been made for a 30 per cent reduction in strategic launchers, and an 'appropriately related' percentage reduction in 'nuclear charges'. The US response was cautious, however, as there was uncertainty as to whether 'charges' signified warheads only, or bombs and cruise missiles as well. There were also attached conditions similar to those Chervov had stipulated, including the elimination of SDI research; limits on intermediate-range offensive missiles (US deployments in Europe); and the inclusion of French and British nuclear forces. The US, meanwhile, was anxious to confine talks to land-based weapons, where it believed the Soviet Union to have a clear advantage.³³

An alternative proposal in the area of strategic arms reductions was revealed soon after the second round ended on 16 July 1985. The Soviet negotiators suggested a ceiling on different categories of strategic weapons which would limit them to a certain percentage of each side's overall arsenal. While the US remained sceptical of the proposal which was not elaborated upon, Robert C MacFarlane, National Security Adviser to President Reagan, gave some indication that the suggestion could be profitably developed in the third round of talks. These were to begin on 19 September 1985.³⁴

● 'Far from having made serious proposals in Geneva on folding up the arms race, the Americans, conversely, are taking steps which are making the process impossible . . . we, of course will have to reassess the entire situation. We just cannot allow the talks to be used anew as a decoy, as a cover for military preparations, the purpose of which is to ensure the strategic superiority of the US and its course of achieving world dominance.' Mikhail Gorbachev, speaking during a visit to the industrial centre of Dnepropetrovsk in the Ukraine. *The Guardian* (London) 27 June 1985.

'Threats are no way to do business.' US Vice-President, George Bush, speaking during a visit to Brussels. *The Guardian* (London) 29 June 1985.

'Strategic stability and trust would, no doubt, be strengthened if the US agreed together with the USSR to reaffirm their commitment in a binding form to the regime of the Treaty on the Limitation of ABM systems.' Mikhail Gorbachev, in reply to a

North-South Monitor

message from the US organisation, the Union of Concerned Scientists, which called for a ban on space weapons. *Soviet News* (London) 10 July 1985.

If the 30 per cent reduction in nuclear 'charges' suggested by the Soviet negotiators applied only to missile warheads, 'this would begin to be a serious proposal'. Edward L. Rowley, a Senior US Adviser on arms control. *IHT* (Paris) 26 July 1985.

'The method of aggregation proposed in these concepts seems designed to favour preservation of the Soviet Union's primary area of advantage, that is in prompt, hard-target kill capability, the most worrisome element in the current strategic equation.' Larry Speakes, the White House spokesman, discussing the Soviet proposal for percentage ceilings on different categories of strategic weapons. *IHT* (Paris) 18 July 1985.

'We have seen a few signs that might ultimately prove to be promising.' Robert C. MacFarlane, speaking of the same Soviet proposal. *IHT* (Paris) 26 July 1985.

'There has been no progress and it's not our fault' Victor P. Karpov, chief Soviet negotiator, speaking before the final session of the second round. *IHT* (Paris) 17 July 1985.

'In a negotiation as complex as this one an agreement will not be easily or quickly arrived at. But we do note a greater emphasis on dialogue and a lesser emphasis on polemics.' Max M. Kampelman, chief US negotiator, speaking after the final session of the second round. *IHT* (Paris) 17 July 1985.

▲ Soviet Union-United States Ministerial Meeting Helsinki, 31 July 1985

■ For the first time since he replaced Andrei Gromyko as Soviet Foreign Minister on 2 July 1985, Eduard Shevardnadze met for talks with the US Secretary of State, George Schultz. The ministers were in Helsinki for the commemoration of the tenth anniversary of the Final Act of the Conference on Security and Cooperation in Europe (CSCE), on 1 August 1985.¹⁵ Both ministers were accompanied by leading disarmament negotiators.

The ministers met for three hours in closed session, proposing, according to subsequent reports from US and Soviet officials, prospective agendas for the November summit meeting in Geneva between President Reagan and Mikhail Gorbachev. They were reported to have agreed on a minimum agenda for the summit, consisting of three broad topics: international security issues, including the Geneva arms talks, the Stockholm Conference on Confidence and Security-Building Measures in Europe and the Vienna Conference on European conventional force reductions; regional issues, such as Afghanistan, Central America and the Middle East; and bilateral issues, such as pending agreements on cultural exchanges, air safety, air landing rights, trade and shipping. US officials, however, did not confirm agreement on the agenda, and the US was known to insist on the inclusion of a controversial fourth topic, human rights. The two sides agreed that the meeting had laid the groundwork for a productive summit, but a difference in approach had also begun to emerge. Remarks by Anatoli Dobrynin, the Soviet Ambassador to

North-South Monitor

Washington, present throughout the meeting, about achieving 'maximum progress', were widely interpreted as hopeful of the summit giving impetus to the deadlocked Geneva arms talks.³⁶ US officials, however, stressed that the purpose of the summit was merely to establish personal contact between the two leaders, and agreement on a broad plan of future action.

In addition to discussing the summit agenda, the ministers reviewed their respective positions on key issues of controversy, such as arms control and human rights. There was no negotiation, and no progress was made towards breaking the deadlock in the Geneva arms control talks. Eduard Shevardnadze merely repeated the Soviet proposal made in July 1985 of a five month unilateral moratorium on nuclear testing, to begin on 6 August 1985, which would remain in force after 1 January 1986 provided the US also refrained from conducting nuclear tests.³⁷ He also apparently rejected the catalogue of alleged human rights abuses in the Soviet Union which George Shultz had listed in his speech at the Helsinki commemoration,³⁸ as inadmissible interference in the internal affairs of the Soviet Union.³⁹

● 'I think that this meeting can be called a good first step' towards making the Reagan-Gorbachev summit in Geneva 'a genuinely productive meeting'. The talks were 'interesting, useful, frank, business-like, productive'. 'The fact remains that while we see some progress in some areas there are some very deep differences.' George Shultz, *IHT* (Paris) 1 August 1985 and *The Times* (London) 1 August 1985. 'The present-day tense world situation, we are convinced, calls for joint efforts to improve drastically the political climate in Europe and in international relations as a whole.' Eduard Shevardnadze, remarks made on arrival at Helsinki airport, on 29 July. Reproduced in full in *Soviet News* (London) 31 July 1985, p 271. 'The most important thing in US-Soviet relations now is the summit, and the first steps were taken today.' Eduard Shevardnadze, *The Guardian* (London) 1 August 1985.

'This will be one of the most complex summit meetings if only for the reason that in recent years the fabric of relations between our two countries has been destroyed. To destroy is easier than to create. We would like to see a restoration of this fabric that existed in earlier periods.' Anatoli Dobrynin, Soviet ambassador to the US, *IHT* (Paris) 1 August 1985.

▲ South Pacific Forum

Fifteenth Annual Summit Meeting

Rarotonga, Cook Islands, 4-6 August 1985

■ The thirteen member-states of the South Pacific Forum, meeting for their annual summit in the Polynesian Cook Islands, adopted a South Pacific Nuclear Free Zone Treaty on 6 August 1985, the fortieth anniversary of Hiroshima.

The 'Treaty of Rarotonga' bans the manufacture, acquisition, stationing or testing of any nuclear explosive device, and the dumping of radioactive waste, within a vast area of the world's largest ocean, south of the Equator. It also prohibits the export of nuclear material without strict safeguards. Signatories are, however, free to determine their own policies with regard to port or airfield calls by nuclear-capable

North-South Monitor

or armed ships or aircraft. At present, a ban on such calls is imposed by the Labour government in New Zealand,⁴⁰ and by Vanuatu, but Australia currently allows port visits by nuclear-powered and nuclear-capable US warships.

The Treaty, originally proposed in 1984 by Bob Hawke, the Australian Prime Minister, was signed by Australia, New Zealand, and six independent Pacific states, the Cook Islands, Fiji, Kiribati, Niue, Tuvalu and Western Samoa. The eight signatures are sufficient to bring it into force. Four more states, Nauru, Papua New Guinea, Solomon Islands and Tonga were expected to sign soon afterwards, but the Prime Minister of Vanuatu, Walteri Lini, was reported to be unwilling to submit the treaty to Parliament for ratification, on the grounds that it was not radical enough.⁴¹

The Forum members determined to send missions to the five nuclear powers (Britain, China, France, the Soviet Union and the US) in an effort to persuade them to sign protocols committing them to observe the treaty. David Lange, Prime Minister of New Zealand, was confident that four of the nuclear powers would lend their support, but doubted that France could be expected to sign more than one of the protocols. France, which was conducting nuclear tests on the French Polynesian Mururoa Atoll, was directly appealed to by the Forum, to cease its testing.⁴² Bob Hawke, meanwhile, when questioned at the meeting, claimed that there was no contradiction between Australia's role as a uranium exporter, and its credentials as an anti-nuclear campaigner.⁴³

●The adoption of the Treaty of Rarotonga was a 'remarkable achievement'. Bob Hawke, Prime Minister of Australia. *The Times* (London) 8 August 1985.

The treaty was a 'good deal'. David Lange, Prime Minister of New Zealand. *Financial Times* (London) 8 August 1985.

'Nuclear tests in the Pacific will continue as long as it will be judged necessary - by French authorities and only by them—for the national defence.' President Mitterrand of France, in a directive issued to the French Armed Forces in August, ordering them to prevent the unauthorised entry of French territorial waters or airspace around the Polynesian Atoll of Mururoa, 'by force if necessary'. *The Guardian* (London) 11 September 1985.

THE NORTH

▲Group of Five (G5)

Extraordinary Meeting of Finance Ministers

New York, 22 September 1985

■Finance Ministers⁴⁴ and central bank governors of the five major Western industrialised countries, Britain, France, Japan, the US and West Germany, met on the initiative of the US. As part of their agreement to conduct mutual surveillance and in preparation for further discussions at the forthcoming IMF and World Bank meetings in Seoul in October 1985, they reviewed economic developments and policies within the five countries.

According to a statement issued after the meeting,⁴⁵ the ministers agreed that the strengthening of the main European currencies and the Japanese yen against the

North-South Monitor

dollar was desirable. In effect committing themselves to intervention in the foreign exchange markets, they agreed to use exchange rates to redress the 'potentially destabilising' trade imbalances between their five countries and in particular the US deficit and the Japanese and West German surpluses. Part of the incentive for such intervention was the desire to curb strong protectionist pressures which it was said 'if not resisted could lead to mutually destructive retaliation with serious damage to the world economy'. A depreciation of the dollar to 'better reflect fundamentally economic conditions' would, it was hoped, increase the competitiveness abroad of US exports, thereby undermining the protectionist lobby in the US Congress.

The interventionist stance of the US was welcomed by European countries particularly by France which had long argued that floating exchange rates failed to reflect economic realities.⁴⁶ There was scepticism outside the meeting however as to the magnitude of the effect the threat of intervention in foreign exchange markets would create. At pains to emphasise their unanimous agreement on the need for non-inflationary economic growth and open markets, the members of G5 did not signal any radical departures from their current policies other than over exchange rates. Britain and West Germany agreed to reaffirm their commitments to reduce taxes, Japan to make efforts to stimulate domestic demand and France to liberalise and modernise its financial markets. The US however planned no change in its fiscal policies despite the argument that a depreciation of the dollar would not correct the US trade imbalance without its being accompanied by fiscal reform.

G5 welcomed the GATT preparatory meeting scheduled for September 1985 and recognised the importance of providing access to its countries' markets for developing-country exports, particularly for debtor countries making efforts towards adjustment. The British Chancellor of the Exchequer, Nigel Lawson, revealed the Group's agreement that the role of the World Bank in assisting developing countries to cope with their debt adjustment problems should be expanded.⁴⁷ Such proposals were to be elaborated upon at the coming meetings in Seoul.⁴⁸

● 'These measures will promote greater convergence in economic performance toward noninflationary growth, which can contribute to a strengthening of nondollar currencies . . . We all believe this is a positive means of addressing concerns about the large trade imbalances among our countries'. James A Baker, US Treasury Secretary, at a news conference. *IHT* (Paris) 23 September 1985.

'The indication here is that the possibility of intervention has come nearer to the fore'. Nigel Lawson, British Chancellor of the Exchequer commenting on the G5 communiqué. *Financial Times*, (London), 23 September 1985.

'A first step in helping to put some order in the international monetary system'. Pierre Bérégovoy, French Finance and Economy Minister. *Financial Times*, (London), 24 September 1985.

NORTH-SOUTH

▲ Africa-Caribbean-Pacific (ACP) Group
Thirty-eighth Ministerial Council Meeting
Brussels, 17-19 June 1985

■ ACP ministers met in Brussels prior to the ACP-EEC Ministerial Council meeting. They were unable to appoint a Secretary-General of the Group, none of the candidates satisfying the requirements for election of a consensus agreement or a two-thirds majority of votes cast. A decision on the matter was postponed until an extraordinary ACP Ministerial Council meeting in Harare in October 1985, but the Council apparently accepted the principle of rotation of the post between six regions of the ACP Group: Caribbean, Pacific and four African. Meanwhile, it was decided that the existing interim Secretary-General, Edwin Carrington, should continue in the post until the ACP Council meeting in October.

The ACP Council approved Angola's accession to the Georgetown Agreement, and its admission to the ACP Group. It also discussed cooperation within the Group, including an air transport meeting due to be convened in Paramaribo, Suriname, on 2-6 September 1985, the ACP October meeting in Harare, as well as the situation in Southern Africa.⁴⁹

▲ Africa, Caribbean, Pacific-European Economic Community (ACP-EEC)
Tenth Ministerial Council Meeting
Luxembourg, 21 June 1985

■ Delegates from the African, Caribbean and Pacific countries met with delegates from the European Community for the first time since December 1984, when the third Lomé Convention (Lomé III) was signed. Marked by the absence of serious disagreement, the Council meeting covered its twenty-point agenda in the course of only one day.

South Africa's recent establishment of an illegal transitional government in Namibia; the raid by its saboteurs on Cabinda in Angola; and the attack by its armed commandos on civilians and refugees in Botswana's capital of Gaborone, made Southern Africa a priority issue. The ACP ministers expressed their concern over South Africa's activities in the region and appealed to the EEC to take specific measures to convince South Africa that it could not attack its neighbouring states with impunity. Attempts to alleviate Southern Africa's economic problems would be futile without the application of pressure against South Africa such as legislation against European and multinational investment in the country. Calling for a meeting of ACP-EEC foreign ministers on Southern Africa, they also supported a proposal made by Tanzania's President Nyerere for a meeting between the foreign ministers of the EEC and those of the Frontline states.

The European ministers replied that they would examine positively the proposal for an EEC-Frontline states meeting. The EEC's commitment to SADC's regional

North-South Monitor

development initiatives was also mentioned by Lorenzo Natali, Vice-President and Commissioner for Development of the EEC, who underlined the ACP's view that all such progress was threatened by the South African regime's military operations in the region.

A second issue of priority to the Council was that of drought and famine. Pascal Nze, President of the ACP Ministerial Council, while appreciating the EEC response to the famine in Africa, cited both the need to redouble emergency aid, and to attack the underlying problem of food production in ACP states. He advocated the achievement of regional food security through national food strategies, and called for the extension to all ACP states of improved early-warning systems, such as remote sensing, to control drought and famine. Lorenzo Natali, affirming that 65 per cent of the EEC relief commitment made at Dublin had been fulfilled, cited problems with port and storage facilities, and inadequate transport, to explain the large amounts of grain blocked at African ports. While he welcomed support for early-warning systems and for coordination between donors and recipients of aid to improve food production, he emphasised the need to tackle the fundamental problems of desertification, resulting from both climatic and human factors, without which, he argued, all other efforts would be futile.

The Ministerial Council also considered the question of the accession of Spain and Portugal to the EEC in January 1986. While the ACP Group had been kept informed of the progress of the negotiations on the matter, to avoid the lack of consultation experienced over Greece's admission, its ministers expressed concern on a number of issues: the problem of sovereignty for some ACP Indian Ocean countries, arising from an amendment to Article 227 of the Treaty of Rome; the possible threat to ACP coffee and cocoa exports, as a result of concessions to Spain on Latin American produce; and the curb on sugar exports from Ivory Coast, Malawi, Swaziland and Zimbabwe stemming from an import quota allocated to Portugal which was much lower than the figure it requested. The EEC ministers determined to negotiate the protocol of accession with the ACP Group (under Article 284 of Lomé III) in the autumn of 1985, once the ACP states had studied the documents relating to the original negotiations. Exploratory talks would encompass the effects of the accessions on the products mentioned.

Other issues considered at the meeting had been agreed to some extent at lower levels, only requiring endorsement by the Ministerial Council. They included trade, sugar prices, industrial and agricultural cooperation, Stabex, matters relating to the implementation of Lomé III which entered into force, in principle, in January 1986, and the situation of ACP students and migrant workers in the European Community.⁵⁰

●The ACP countries 'do not want to believe that the Community states are not aware of the destructive effects of the acts of barbarism or piracy carried out or financed by South Africa on the development efforts launched with their own assistance'. Pascal Nze, President of the ACP Council of Ministers.

'Everything we were in the process of building together with our SADDG partners is being jeopardised. South Africa's systematic policy towards its neighbours leads to the undermining of progress made in certain areas. The unstable situation is having dire consequences not only for the countries which have been victims of aggression,

North-South Monitor

out also for all the countries in this region.' Lorenzo Natali, Vice-President and Commissioner for Development of the EEC. *Europe agence internationale l'information pour la presse* (Brussels) No. 4115, 22 June 1985, pp 7-8.

▲ General Agreement on Tariffs and Trade (GATT)

Consultative Group Meeting

Geneva, 8-9 July 1985

■ The eighteen-member GATT Consultative Group, a representative cross-section of GATT's ninety contracting parties, met to resolve differences over the initiation of a new round of multilateral trade negotiations (MTNs), prior to a meeting of the GATT Council. By the end of the Group meeting, however, disagreement on the question of trade in services still remained the major obstacle to new round.

The EEC, Japan, Canada and the Nordic countries submitted position papers to the Consultative Group, in reply to doubts expressed over new MTNs by twenty-three developing countries in a paper submitted to the last GATT Council meeting on 5 June 1985.⁵¹ These position papers went a considerable way towards satisfying the developing countries' demands for prior talks on trade in goods. The industrialised countries agreed in principle to the 'standstill' and 'rollback' of protectionist measures and they affirmed that agreement to hold preparatory meetings need commit neither GATT to launching MTNs nor individual members to participation in a new round.

The US, with the formal support of Japan, the EEC and most industrialised countries was, however, insistent on the inclusion in a new GATT round of trade in services, a concept clarified at the meeting by Michael Smith, US Deputy Trade Representative. He said the US was seeking a 'legal framework of rules and procedures' to govern trade in services. The precise activities covered would be subject to negotiation, but the US would include banking, insurance, telecommunications, data processing, shipping, aviation, construction and engineering. The US would expect 'transparency', and obligatory notification to GATT of all laws and regulations intended to protect domestic service industries, and would seek to establish principles governing the behaviour of public monopolies towards foreign competitors. Priority would be attached to reaching agreement on international information flows.⁵²

A Brazilian 'communication' circulated at the meeting objected on behalf of several developing countries that existing GATT rules were inapplicable to trade in services (the seven GATT rounds which have been held since World War I have all been devoted exclusively to trade in goods). It stipulated a series of guarantees to be given by the industrialised countries as preconditions for preparatory talks on MTNs, and affirmed the concept of 'delinking', or that there should be no 'parallelism' between the two independent negotiating processes involving goods and services. This position constituted a hardening of the Brazilian attitude from the 'twin-track' negotiating formula involving goods and services in separate but parallel talks, which had been tabled by Brazil's Foreign Minister, Flavio Setubal, at an informal meeting of some GATT members in June 1985.⁵³ In

North-South Monitor

common with some other developing countries, Brazil was anxious for outstanding provisions (particularly those concerning agriculture) from the 1973-9 GATT Tokyo round to be implemented before a new round was begun. It was apprehensive of the possibility that the industrialised countries might force concessions on services as the price of lowering their own barriers to goods, such as Third World textile exports. It also feared that competition from the highly developed service industries of industrialised countries would force its own fledgling industries out of business. The meeting ended in stalemate, as Michael Smith, with the support of the EEC, reiterated the US position that trade in services should be included in MTNs, wholly under the aegis of GATT, thus rejecting the Brazilian conditions.⁵⁴

▲ GATT

Council Meeting

Geneva, 17-19 July 1985

■ The ninety members of the GATT Council failed after two days of discussions to reach a consensus on the convening of a preparatory meeting for a new round of MTNs.

Tran Van-Thinh, the EEC Ambassador, tabled a draft resolution calling for a meeting of senior GATT officials on 9 September 1985, to prepare a new round of talks covering both goods and services. Brazil's Ambassador, Paulo Nogueira Batista, countered with an alternative proposal for a meeting in September to 'explore the possibility' of new negotiations on trade in goods, and a separate meeting in October 1985 for an 'exchange of information' on trade in services. Neither resolution was carried. While at least thirty developing countries had accepted talks on services as the price to be paid for ending protectionism, Brazil's allies, including Argentina, Egypt, Gabon, India, Nicaragua, Nigeria, Uruguay and Zaire, formed a hard-core of opposition. Brazil, moreover, claimed that the US, in the form of Michael Smith, Deputy Trade representative, had formerly accepted its 'twin-track' proposal, only to change its stance, on the prompting of Clayton Yeutter, US Special Trade representative.⁵⁵

The meeting was suspended after the US announced its intention to circumvent the deadlock through an unusual procedural manoeuvre. On 28 July 1985 it formally requested Felipe Jaramillo, the Colombian Chairman of GATT, to call a special session of GATT members in September, by majority vote, thus departing from the tradition of securing decisions by consensus. By 31 August 1985, the deadline for concurrence, sixty-two of the ninety members of GATT had voted in favour of the US move, and on 9 September 1985, Felipe Jaramillo accordingly issued an invitation to GATT contracting parties to examine 'the subject matter and modalities' of a proposed new round of MTNs.

While the US move had been supported by Canada, the EEC, Spain, Portugal and Japan, some of these countries were reported to have reservations about the divisive nature of the tactic. France in particular was reluctant to convene a meeting for which no agenda had been agreed, and which could then result in a further stalemate.⁵⁶ Attempts by the EEC and Japan to arrive at a preliminary understanding through

North-South Monitor

informal discussions with the core of the developing countries which had blocked consensus in the Council, were, however, reported to have failed.⁵⁷

●Brazil's draft resolution was 'a serious contribution to unblock the impasse'. Paulo Nogueira Batista, Brazilian Ambassador. *Financial Times* (London) 18 July 1985.

The deadlock in the Council was caused by 'silly procedural manoeuvres'. Peter Murphy, US Ambassador to GATT. *Financial Times* (London) 20 July 1985.

'The time has definitely come for a new major trade negotiation. We need to reaffirm the credibility of GATT rules and reimpose them in areas that have slipped outside the realm of liberal trade. Otherwise, we will wake up one fine morning only to find that GATT has passed into the history books.' Arthur Dunkel, Director-General of GATT. *IHT* (Paris) 20 August 1985.

▲GATT

Textiles Committee Meeting
Geneva, 23 July 1985

■Representatives of the forty-two state parties to the Multi-Fibre Arrangement (MFA) met for the first of a series of meetings under GATT auspices, to determine whether or not to renew the arrangement or negotiate a successor.⁵⁸ The MFA, in force since 1973, and twice extended in 1978 and 1982, is due to expire at the end of July 1986, but the terms of the agreement dictate its being reviewed twelve months before that date.

Representatives of the EEC and Japan were in favour of the negotiation of a successor agreement, and they conceded that a progressive liberalisation of the MFA was required. The MFA, which governs roughly 80 per cent of the world's trade in textiles and clothing, had originally been designed to allow the Western industrialised producers to restructure in the face of rising competition from the low-cost developing-country producers, by guaranteeing them shares in the textile market. Trade liberalisation would in effect mean increased access to Western markets for the textiles and clothing of such countries as India, Indonesia and South Korea. While the EEC representative pleaded continuing difficulties in the Community's textile industries, with consumption virtually stagnant, and unemployment severe, he said that Europe's imports had been steadily developing since 1974, and that he was in favour of progressively freer trade in textiles. The EEC was reported to be anxious to secure its own consensus regarding the MFA before the accession of Portugal and Spain (at the beginning of 1986) which would be likely to bring with them protectionist pressures, in an attempt to safeguard their own textile industries. The Japanese representative advocated a renewal of the MFA without radical changes, but with modifications in the direction of increased liberalisation.

The US representative, meanwhile, though arguing that the negotiation of a successor arrangement to the MFA was in the interests of all countries, dissociated himself from calls for trade liberalisation. Noting that the US textile industry was being adversely affected by increasing imports, particularly from South East Asia, he warned of strong protectionist pressures in the US, already reflected in support within the US Congress for the 'Jenkins Bill' restricting imports.⁵⁹

North-South Monitor

Developing countries had already held meetings to coordinate their positions with regard to the MFA's future.⁶⁰ The representative of South Korea, speaking on their behalf, argued that the Committee would have to address the question of whether three features of the MFA could continue to be justified: the protection of the textile and clothing industries of developed countries; special treatment for those countries in the form of derogation from GATT rules; and persistent discrimination against developing countries. Arguing that the textile trading system had become increasingly restrictive and discriminatory, he reiterated the appeal of the twenty-one developing countries in Mexico City earlier in 1985, for the full application of GATT rules to the sector, and their rejection of the approach making the removal of quotas on developing country exports conditional on their making reciprocal trade concessions. The Korean representative also voiced a fear felt generally among developing countries in the Committee, that protectionist legislation pending in the US Congress, if passed, would make the MFA redundant, and possibly undermine the entire GATT structure, through the introduction of unilateral restrictive practices by the US.

However, there was less than total unanimity amongst developing countries in their opposition to the MFA. While 'hardline' developing countries such as India and Egypt had previously been seeking the complete elimination of the MFA, and the opening up of Western markets, the voice of the less 'hardline' but relatively industrially advanced countries, such as South Korea, Hong Kong and the ASEAN member-states, seemed to have prevailed in the Committee. Those countries, which may also have something to fear from the exports of even lower-cost, less-industrialised countries, were seeking the negotiation of a successor agreement.⁶¹

● 'It has failed in its central objective of facilitating structural adjustment in developed countries' textiles and clothing industries and has left us farther away from the goal of trade liberalisation sought in 1974.' Joun Young Sun, representative of South Korea, on the MFA. *Financial Times* (London) 24 July 1985.

The MFA should be operated 'in a more flexible manner'. Jean-Pierre Leng, chief textiles negotiator for the EEC. *Financial Times* (London) 7 August 1985.

'This meeting is taking place in particularly critical circumstances. We have on the one hand an upsurge of protectionist pressures, some of which have translated themselves into proposals for a further tightening of restrictions on textiles and clothing; on the other hand, the contracting parties are engaged in an effort to strengthen the trading system so as to improve its capacity to withstand these pressures and to seek a broad process of liberalisation.' Arthur Dunkel, Director-General of GATT and Chairman of the Textiles Committee. *GATT Focus* (Geneva) August–September 1985.

▲ Association of Southeast Asian Nations (ASEAN)—Australia, Canada, EEC, Japan, New Zealand, US
Meeting of Foreign Ministers
Kuala Lumpur, 11–14 July 1985

■ Foreign ministers of ASEAN (Brunei, Indonesia, Malaysia, Philippines,

North-South Monitor

Singapore and Thailand) and its dialogue partners, meeting in Kuala Lumpur, discussed issues including a settlement in Kampuchea, Kampuchean refugees, trade, protectionism and drug trafficking. The meeting followed a gathering of ASEAN Foreign Ministers in Kuala Lumpur several days previously.

In a major speech on 12 July 1985,⁶² the US Secretary of State, George Shultz, gave formal US endorsement to ASEAN's proposal for proximity talks on Kampuchea. Although departing from initial US scepticism of the original Malaysian initiative on the grounds that it implicitly recognised the Heng Samrin regime installed in Phnom Penh by Vietnam, Shultz qualified US support by pointedly affirming his assurance that ASEAN was not moving towards recognition of the 'puppet Heng Samrin regime'. Describing Vietnam as a threat to peace in East Asia, he said that the normalisation of relations between the US and Vietnam was dependent on the withdrawal of Vietnamese troops from Kampuchea, and on a settlement acceptable to ASEAN. Following his recent visit to the Thai-Kampuchean border, where he met leaders of the Khmer People's National Liberation Front, and his recent high-level talks with the Bangkok government,⁶³ Shultz confirmed the US intention to increase military assistance to the 'frontline' state of Thailand, which had already risen from \$39m to \$107m in the past four years.⁶⁴ With regard to Kampuchean refugees, the US and Canada expressed the intention to continue with their resettlement programmes, and the Japanese Foreign Minister announced a doubling to 10,000 of the number of refugees from Kampuchea that it would accept.

George Shultz further detailed a five-point programme of action for world governments to create 'a long period of global expansion and a new era of unprecedented prosperity'. He said the US would reduce its federal spending and fiscal deficit, helping to bring down interest rates and the value of the US dollar, thus easing the international debt problem. He said that Western Europe should make efforts to secure economic expansion; Japan should end protectionism and reduce its trade surplus; and developing countries, especially those in debt, should make structural adjustments by stabilising their economies, decreasing state interference, expanding trade and stimulating growth. He also said that a new GATT round should be supported by all countries as a means to freer trade. Identifying India and Brazil as the main stumbling-blocks to a new round of MTNs, in their opposition to the inclusion of services in the new round, Shultz urged ASEAN to intervene to promote a new GATT round.

ASEAN ministers in their turn endorsed Western proposals for MTNs, but called for greater access to US and Japanese markets. Warning that a US-Japanese trade war could damage the interests of ASEAN members, they expressed concern over pending US protectionist legislation. They also recognised the fact that intra-ASEAN trade was only 2 per cent of all ASEAN's international trade, and determined to make efforts to increase it.

Malaysia led a concerted ASEAN drive against drug abuse and the drug trade, urging the UN to continue its efforts against heroin trafficking in the 'golden triangle' between Burma, Laos and Thailand.⁶⁵

● We are reassured by your statement that you would certainly not want to move in a direction that would imply recognition of the puppet Heng Samrin regime . . . This approach deserves the backing of the international community, and the United

North-South Monitor

States certainly supports it.' US Secretary of State, George Shultz, commenting on the Thai proposal for proximity talks between the Kampuchean resistance coalition, and a Vietnamese delegation, including representatives of the Heng Samrin regime. *The Times* (London) 13 July 1985.

ASEAN 'is no longer a small or insignificant segment of the world atlas . . . It has helped immeasurably to give each of the member states a degree of psychological self-confidence which has helped to prevent rash actions and panic policies over all these years.' Datuk Mussa Hiptam, Deputy Prime Minister of Malaysia, assessing ASEAN's first eighteen years. *The Times* (London) 16 July 1985.

SOUTH-SOUTH

▲ Group of 77 (G77)

Ministerial Conference

New Delhi, 25-26 July 1985

■ Ministers met to review progress on negotiations for a global system of trade preferences (GSTP). The decision to launch these negotiations was taken at a previous G77 Ministerial meeting in New York in October 1982. Developing countries hoped to expand mutual trade through the granting of tariff and non-tariff concessions to each other and through other measures such as long-term contracts. By the time of the meeting, fifty-five countries had indicated their intention to participate in such negotiations.⁶⁶

The conference adopted a declaration urging developing countries to promote mutual trade and fixing a timetable of two years for the establishment of tariff and non-tariff concessions including a general tariff cut of 10 per cent. The negotiating committee was given a deadline of 1 May 1987 by which to complete its work. It was considering three approaches to the expansion of trade: a traditional product-by-product approach, a general tariff reduction of up to 10 per cent on all products and a concentration on specific sectors of particular importance to developing countries such as agricultural and processed tropical products, non-textile handicrafts and textiles. It was decided that the first round of negotiations in Geneva should begin not later than 1 May 1986 and be completed in exactly one year.⁶⁷

▲ Non-Aligned Movement (NAM)

Eighth Foreign Ministers' Conference

Luanda, Angola, 2-7 September 1985

■ Foreign ministers from 71 of the 101 NAM member-countries attended the meeting in Luanda, including the representatives for foreign affairs of SWAPO and the PLO. A further ten participants had observer status, and eighteen were invited guests, including delegations from the Sahrawi Arab Democratic Republic (SADR), El Salvador's guerrilla movement, the FMLN, and Fretelin, the movement fighting for East Timor's independence from Indonesia. Of these groups, SADR and the

North-South Monitor

FMLN enjoyed the almost unanimous support of NAM. A division, however, between on the one hand those in favour of supporting Fretelin (the observer Portugal, and its five former colonies) and on the other hand those opposed to its recognition (Indonesia and other states, including African countries such as Nigeria and Senegal with large Muslim populations) resulted in only cursory reference being made to the East Timor group in the final declaration.

This document, dubbed the 'Luanda Declaration', was the result of a final consensus after the revision in a political committee (headed by Cyprus) and an economic committee (headed by Guyana) of draft political and economic declarations. These drafts were prepared for the conference by the host country, Angola. The final document was apparently considerably stronger than that originally proffered by Angola, and reflected the NAM's preoccupation with the situation in Southern Africa. Also indicative of this preoccupation was the choice of a Southern African Frontline state, Zimbabwe, as the Chair of NAM for the next three years, and the host of the eighth NAM summit in 1986.

Iraq, Libya and North Korea had been contenders for the hosting of the next NAM summit, but had all withdrawn in the face of support for Zimbabwe. The spokesman for the two-day Preparatory Meeting which preceded the conference, Angola's Propaganda Minister, Paulino Pinto João, confirmed that the choice was in accordance with an agreement among a majority of NAM countries that, in view of the situation in Southern Africa, a Frontline state should host the summit.

The Luanda Declaration urgently appealed to the UN Security Council to impose comprehensive and mandatory sanctions on South Africa, in an effort to eliminate apartheid. It appealed for the immediate release of Nelson Mandela, and other political prisoners, and for increased moral, political and material aid to the African National Congress (ANC). It condemned the US administration's policy of 'constructive engagement', and the repeal by US Congress of the Clark Amendment prohibiting assistance to the rebel movement in Angola. The military occupation of southern Angola was considered an aggression which must be ended by the complete and unconditional withdrawal of South African troops, and the 'linkage' of this withdrawal with the removal of Cubans from Angola was categorically rejected. The ministers condemned Pretoria's illegal government in Namibia, which they said was in violation of UN Security Council Resolution 435, and advocated increased material and political aid for SWAPO. Concern was expressed at South African attempts at destabilisation in Mozambique, Botswana and Lesotho.

For the first time, a special section of the final document was devoted to the problem of foreign debt. A consensus was formed to the effect that the debt was a political as much as an economic issue, which threatened the stability and sovereignty of developing countries and which called for global and political solutions. The implementation of a new world economic order was advocated as a contribution to a solution, and the IMF was criticised for the stringent measures it was imposing on debtor countries. Approval was given to Peru's formula of limiting debt repayment to a percentage of exports. Cuba and Algeria gave their support to the formula at the meeting, despite previous calls for more radical solutions.

The Luanda Declaration called for the withdrawal of foreign troops from Afghanistan, and the cessation of foreign interference in Kampuchea. It condemned the Israeli occupation of South Lebanon, calling for the immediate withdrawal of

North-South Monitor

troops, while affirming the support of NAM for the PLO as the sole legitimate representative of the Palestinian people, and welcoming the Arab League's Fez Peace Plan. US actions against Nicaragua, including the trade embargo, were condemned as violations of international law, and its unilateral suspension of bilateral talks with the Sandinistas was deplored. The Contadora Group was commended as an authentic regional initiative aimed at the peaceful resolution of conflict in Central America. Solidarity was expressed with Cuba, while the maintenance there of US military bases was rejected, as were those in Puerto Rico and the Falklands/Malvinas.

The conference reiterated its appeal for general and complete disarmament under international control, and for the signing of a comprehensive nuclear test ban agreement. It denounced the use of outer space for the introduction of new military technology and urged the creation of an agreement banning chemical weapons entirely. Satisfaction was expressed over the Five Continent Peace Initiative which had resulted in the Delhi Declaration of January 1985.⁶⁸

● 'The Non-Aligned Movement seems relevant again.' Witness Mangwende, Foreign Minister of Zimbabwe. *The Guardian* (London) 9 September 1985.

▲ Arab League

Meeting of Foreign Ministers: Extraordinary Summit Conference
Casablanca, 5 August: 7-9 August 1985

■ The first Arab League Summit since September 1982 met in Casablanca at the invitation of King Hassan II of Morocco, to consider 'issues dividing the Arabs', and more specifically, 'the Palestinian question in all its aspects'.

King Hassan's announcement of the summit came as something of a surprise, a previous attempts, including those of Jordan and the PLO, to rally Arab support for a summit had failed. The Chairman of the PLO, Yasser Arafat, had been urging discussion of the attacks by Shiite Muslim militias on the Palestinian refugees in Beirut camps, ever since they began in May 1985. Both Yasser Arafat and King Hussein of Jordan were also anxious for united Arab endorsement of their Amman Accord, of 11 February 1985.⁶⁹ This was intended to pave the way for a joint Jordanian-Palestinian delegation to negotiate a settlement with Israel, based on UN Security Council resolutions (particularly Resolution 242 of 1967) involving the recovery of the Israeli-occupied West Bank and Gaza Strip, and the creation of a Palestinian State confederated with Jordan. Moves for a summit had been repeatedly blocked by Syria, which accused the PLO of complicity in the attacks on Palestinian refugee camps. Syria had supported Palestinian factions opposed to the leadership of the PLO, and had strongly opposed the Hussein-Arafat Accord. In consequence of this obstruction, King Hussein had been promoting what he termed 'a new constructive alignment of Arab countries'.⁷⁰ Such an alignment might involve abandoning the customary requirement of unanimity from Arab League members in favour of majority support for Jordanian-PLO 'moderate' peace initiatives leading to the isolation of Syria and other states which rejected those plans.

Prospects for a summit had improved, however, when Saudi Arabia, which had

North-South Monitor

been assiduous in its attempts to remain neutral in the deepening conflict between Jordan and Syria, agreed to attend. The summit was boycotted, by five of the twenty-one League members: Algeria, Lebanon, Libya, South Yemen and Syria. (A Libyan representative attended the prior meeting of foreign ministers, but left without explanation the day before the summit, having denounced the PLO for its accommodation of Israel, and Iraq for its aggression against Iran.⁷¹ Of the sixteen members in attendance, only ten were represented by heads of state, others, including Iraq, Kuwait and Oman, sending lower-level representatives. Notably absent was King Fahd of Saudi Arabia, who chose to send the heir apparent, Crown Prince Abdullah, in his stead, amidst speculation that although willing to align itself to the more moderate League members, Saudi Arabia was not prepared to antagonise Syria.

While the foreign ministers were reported to be unable to agree on an agenda for the summit, its recognised priority was consideration of the Amman Accord, the purpose being, according to King Hassan's invitation, 'to determine whether it conforms with the Fez peace plan'. This plan, formulated at the last Arab League Summit in Fez, in September 1982, with Syria in attendance, had unequivocally demanded Israel's withdrawal from the territories occupied in 1967, and the establishment of an independent Palestinian state with Jerusalem as its capital. It had been the first Arab peace proposal which implicitly recognised the state of Israel, in that it called for the peaceful coexistence of 'all states in the region'.⁷² Although there were reported to have been slight differences in approach at the summit between King Hussein and Yasser Arafat, with King Hussein seeking absolute confirmation of the Amman Accord, and the PLO Chairman unwilling to force the issue for fear of exacerbating divisions in the Arab world, much of the summit was spent in their presentation of the joint peace initiative as a 'mechanism' for the implementation of the Fez peace plan.

A final communiqué⁷³ confirmed the League's adherence to the spirit, principles and resolutions of the Fez Summit. The conference also 'recorded with full appreciation' the detailed explanations of King Hussein and Yasser Arafat on the compatibility of the Amman Accord with the Fez peace plan, and 'regarded it as a plan of action to implement the Arab peace plan for the achievement of a peaceful, just and comprehensive settlement guaranteeing the withdrawal of the Israeli occupation forces from all the occupied Arab territories, at the forefront of which is Holy Jerusalem, and securing the regaining of the firm national rights of the Palestinian Arab people.' This cautious endorsement of the Amman Accord rejected the contention of the Kuwaiti foreign minister that the Fez and Amman plans were incompatible. The communiqué also indirectly criticised Syria by 'affirming support for the PLO as the 'sole legitimate representative of the Palestinian Arab people', asserting its right to independence in national decisionmaking, and condemning interference in its internal affairs. The PLO and the Lebanese Government were urged to 'cooperate and coordinate' to protect the Palestinian camps in Lebanon.

Following a last-minute item added to the agenda, Iran's disregard for all peace proposals in its five-year war with Iraq was condemned. The Arab states said they would have to reconsider Arab relations with Iran, if the war was prolonged, and pledged continued financial support to Iraq. The summit established two

North-South Monitor

committees, one under the joint chairmanship of Saudi Arabia and Tunisia to reconcile differences between Jordan and Syria, and between Syria and Iraq; and the other chaired by Mauritania, Morocco and the UAE to reconcile Iraq with Libya, and Libya with the PLO. No mention was made of effecting a reconciliation between the PLO and Syria. Finally, the summit charged King Hassan with presenting the Arab case to the leaders of the US and the Soviet Union before their summit in November 1985.

While these decisions were made by majority, no formal resolutions were passed, as it was felt that the five states not represented could not be bound by them. Nor was the question considered of Egypt's readmission to the League, after its expulsion in 1979 following its separate peace treaty with Israel. Such a decision, it was felt, could not be made while attendance at the summit was incomplete.

Despite fears, notably on the part of the Omani Foreign Minister, Yusef el-Alawi, for the future of the Arab League, the way was left open at the end of the summit for the regular League session, tentatively scheduled for November 1985, in Riyadh.⁷⁴

▲ Arab League

Council of Foreign Ministers: Eighty-fourth regular Meeting
Tunis, 9–11 September 1985

■ Foreign Ministers met to review the latest developments in the Arab world since their last regular session in March 1985⁷⁵ and particularly since the Arab League summit in Casablanca.

Following the presentation of a report by the Secretary-General of the League, Chadli Klibi, on the Palestinian issue, the Council was reported to have denounced the attack on the Palestinian refugee camps in the Lebanon, particularly the Bourjel-Barajneh camp in Beirut. The Council reportedly reiterated its guarantees of the security of the Lebanese refugee camps. According to a communiqué issued after the meeting, the Council members gave unanimous support to Jordan for defending its territorial integrity against threats from Israel. The Council also studied proposals for setting up a fund to finance schools in the Israeli-occupied territories.

Arab-African cooperation was an important issue at the session. In his speech to

North-South Monitor

the Council, Chadli Klibi discussed the need to contain Israeli penetration of Africa through an increased Arab presence, particularly in the technical and cultural fields. The possibility of increased aid to drought-stricken Africa was discussed. According to the communiqué, the Council also pledged a boycott of South Africa, supporting sanctions against the regime. It condemned the US and other countries which assisted South Africa and appealed to the African people to resist collectively attempts at collusion between Israel and South Africa.⁷⁶

▲ OPEC Ministerial Monitoring Committee
Twentieth Meeting
Geneva, 23 April 1985

Ministerial Executive Council
Fourth Meeting
Geneva, 30 April–19 May 1985

■ OPEC's Ministerial Monitoring Committee (MMC)⁷⁸ met in April to consider a report by its marketing experts on the state of the world's oil market. The report estimated that demand for oil in 1985, outside the communist world, had increased less than one per cent from the figure for 1984, and that demand in the coming months was likely to be lower than had been previously forecast, owing to the poor overall economic performance of the industrialised countries. Noting that some member countries were exceeding their production quotas, the committee urged compliance with individual quotas and with the overall OPEC production ceiling of 16m b/d, agreed in October 1984.⁷⁹ The committee expressed concern that OPEC's official price structure would be further undermined unless the supply of oil was restricted.⁸⁰

It cautioned against the possible impact on the price structure of increased volumes of refined product exports from member-countries, and criticised some countries for direct and indirect discounting from official prices, and the practice of bartering oil for other products, on the grounds that they weakened the market still further.⁸¹

The meeting of the MMC was followed by a meeting of OPEC's Ministerial Executive Council, established in December 1984 as a supervisory body for the audit and control of oil production and prices in member-countries.⁸² Council members expressed a determination to maintain OPEC's price structure, and to discipline countries exceeding their production quotas. The Council notified Ecuador that its membership of OPEC would be reconsidered if it continued to flout its production quota, and Nigeria, which is the only OPEC country which has not admitted OPEC's auditors, was persuaded to grant permission for the auditors to visit the country to monitor export levels.⁸³ The Council agreed that technical problems in setting up a monitoring system for production quotas and prices had been successfully resolved.

Other issues discussed included the monitoring of condensate output by the auditors, how to categorise crude oil supplies by Saudi Arabia and Kuwait on behalf of Iraq on a line-swap basis, and the problem of Dubai, which has refused so far to observe OPEC's price or production regulations. Given Algeria's continuing

North-South Monitor

objections to the monitoring of condensates, the MEC decided that the auditors should delay monitoring them until the issue had been discussed by the full OPEC Conference.⁸⁴

● 'Saudi Arabia and OPEC as a whole will do their best so as to prevent a further drop in oil prices' Sheikh Ahmad Zaki Yamani, Oil Minister of Saudi Arabia. *IHT* (Paris) 8 May 1985.

▲ OPEC

Ministerial Executive Council

Fifth Meeting

Taif, Saudi Arabia, 2-3 June 1985

■ Convened at Saudi Arabia's request to consider how best to defend OPEC's oil price structure against the downward pressure on prices, the Ministerial Executive Council meeting was attended by its five members and by the oil ministers of Kuwait, Iran, Ecuador, and a non-OPEC member, Mexico.

During prior informal consultations at Taif, Sheikh Yamani conveyed a message from King Fahd, warning of Saudi impatience with the departure of some OPEC members from agreed production quotas and prices. He made it clear that Saudi Arabia was becoming tired of acting as 'swing producer', restraining its own production in the face of other producers' excesses, in order to maintain the 16m b/d OPEC ceiling, and keep oil prices up.⁸⁵ The message in effect constituted a warning that Saudi Arabia might release large volumes of oil on to the market, selling increased quantities of oil and forcing down prices. It was thought that only the two low-cost producers, Saudi Arabia and Kuwait would be likely to survive such a drastic flooding of the market. In a similar bid to discipline OPEC members, a resolution was tabled to impose sanctions, including expulsion, on those exceeding production quotas.

Despite extensive speculation prior to the meeting on the possibility of price cuts being recommended (with Saudi Arabia known to be in favour of reductions in the price of heavy crude oil, and Libya and Algeria absent from Taif, apparently in protest against the proposal), the issue of prices was not discussed. OPEC's President, Dr Subroto of Indonesia, attempted to quell speculation after the meeting by releasing a statement through OPECNA, the official OPEC news agency, to the effect that there was no prospect of price cuts. Nor was the equally contentious issue of changes in production levels debated. A request from Ecuador for a raising of its quota was rejected outright, and the maintenance of the existing 16m b/d OPEC ceiling was supported.

The two issues of price differentials between different grades of oil, and production quota allocations, have been particularly divisive within OPEC, as they have highlighted conflicts of interest within the organisation. A reduction in the price of heavy crude oil, in accordance with a slump in demand for fuel oil, would benefit certain producers, such as Saudi Arabia and Kuwait, at the expense of producers of light crude oil, such as Algeria, Libya, Iran, Nigeria and the UAE. These countries have been unwilling to see their oil being made less competitive through OPEC price

North-South Monitor

differentials being brought into line with market differentials.⁸⁶ Similarly, Saudi Arabia's insistence on restoring its own share of the market, and curbing the over-production of other OPEC members, stoked resentment over the original production quotas, which, it was agreed, favoured sparsely populated states such as Saudi Arabia, while restricting the production of populous states outside the Gulf, who were suffering from development problems and onerous external debts.

It was decided at Taif, that in view of the serious problems confronting the market, the date of the full OPEC conference should be brought forward from 22 July to 30 June 1985, though this was subsequently deferred till 5 July 1985.⁸⁷

● 'If some OPEC producers can sell as much oil as they can at any price, then others will also be free to do as they please'. Message from King Fahd of Saudi Arabia, to the Ministerial Executive Council. *IHT* (Paris) 6 June 1985.

▲ OPEC

Ministerial Monitoring Committee
Twenty-first Meeting
Vienna, 4 July 1985

OPEC Conference
Special Consultative Meeting
Vienna, 5-7 July 1985

■ Unable to agree on changes in price or production levels, the Ministerial Monitoring Committee decided to recommend to the conference that they remain constant.

In an abrupt change of position from an advocacy of price cuts for heavy crude oil, Sheikh Yamani declared Saudi Arabia's support for the present price structure, but called for a reduction of OPEC's production ceiling prior to the MMC meeting. Neither of these alternatives was without opposition amongst MMC members, however. At a meeting in Algiers between the oil ministers of Kuwait, Venezuela and Mexico, and those of Libya and Algeria (known to be supported by Iran) the North African countries had remained adamant in their rejection of price cuts, and of any reduction in the differential between heavy and light crude oil. On the other hand, populous and impoverished states, such as Nigeria and Ecuador were already known to be reluctant to countenance cuts in output.

At the three-day talks in Vienna, the Conference was not promoted from consultative to ministerial status, as no strategy for halting the slide in oil prices could be agreed upon. It was decided to leave the price structure unchanged, and based on the marker of \$28 per barrel for Saudi crude. A Kuwaiti proposal for a 7 per cent cut in OPEC's production ceiling, to just under 15m b/d was blocked, and instead, a range of mechanisms was proposed for regulating prices.

A committee was set up to report to the forthcoming Geneva conference on the feasibility of establishing a central market monitoring agency to control oil flows and prices. A system of seasonally adjusted production ceilings, with fluctuations of 7 per cent above and below the existing level, was agreed in principle. The ministers also

North-South Monitor

considered a proposal made at the MMC by Iraq's oil minister, Qassim Taki al-Oraibi, for the sharing of OPEC's oil revenues amongst its members, to replace the regulation of production. Such radical reforms were widely held to be impracticable, however, because they would further impinge on the sovereignty of OPEC's member-states, and somewhat irrelevant to OPEC's most pressing problems. More specifically, a public pledge was made to end unofficial price discounting, but this announcement was qualified by Nigeria's undertaking to abide by it only if other members did so.⁸⁸

● If we find that another country will not obey the rules we will not feel obliged to obey the rules.' Tam David-West, Nigerian Oil Minister. *The Guardian* (London) 9 July 1985.

▲ OPEC

Ministerial Committee on Price Differentials
Geneva, 21 July 1985

OPEC Ministerial Conference
Geneva, 22-25 July 1985

■ Convening after a meeting of the Ministerial Committee on Price Differentials,⁸⁹ the full OPEC Conference on the initiative of Saudi Arabia deferred decisions on individual and collective production levels until the autumn. Despite formal requests for higher quotas from Iraq, Ecuador, Gabon and Qatar, eleven OPEC members agreed to the elimination of the issue from the conference agenda, only Algeria and Ecuador abstaining. The major issues discussed by the conference were price differentials and production discipline. Mexico attended the conference as an observer.

Saudi Arabia, Kuwait and Venezuela, the only three OPEC members selling their oil at official rather than discounted prices, proposed the reduction of heavy crude oil prices to bring OPEC prices more into line with market differentials, Venezuela threatening to lower its prices unilaterally, following recent cuts by the non-OPEC member, Mexico.⁹⁰ The proposal was resisted by Algeria, Libya, Iran, UAE and Nigeria, but the conference had been poised on the point of agreeing to a 50¢ per barrel cut in Arabian heavy, and equivalents, and a 20¢ per barrel cut in Arabian medium, and equivalents, when Saudi Arabia unexpectedly pushed for a larger, 60¢ cut on heavy crude. Only after the Iranian Oil Minister, Mohammed Gharazi, had walked out, and threatened to abandon the conference in protest, was agreement reached on the price reductions suggested initially. Ten members voted for the proposal; it was opposed by Algeria, Iran and Libya. Despite plans to expand Saudi production (reported to have fallen to 2.2-2.3m b/d) the cut in the price of Arabian heavy was thought unlikely by experts to solve Saudi Arabia's problems, the price of \$26 per barrel remaining \$1 above the spot-market price.

While the conference was reported to have been preoccupied with the issue of discipline amongst OPEC members over production and price levels, no mention was made in the press communiqué of a proposed resolution to extend the powers of

North-South Monitor

OPEC's auditors. Five member-countries were reported to be refusing to open their books to the auditors, but little or no progress was made on the issue.⁹¹

●'We are going to enter into a comfortable phase which shall last up to the end of next winter'. Sheikh Yamani. *The Guardian* (London) 1 August 1985.

The decision on prices 'has no meaning at all'. Algeria's Oil Minister, Belkacem Nabi. *IHT* (Paris) 26 July 1985.

▲Organisation of Petroleum Exporting Countries (OPEC)

OPEC Ministerial Conference

Vienna, 3-5 October 1985

■The Conference met to reconsider the question of output quotas, which it had failed to resolve in July. Once again the ministers were unable to reach agreement on the allocation of quotas among OPEC's thirteen members.

Six OPEC members, Ecuador, Gabon, Iraq, Iran, Qatar, and the UAE were all requesting increased quotas. The Libyan delegate made it known that Libya, too, would expect a higher quota if the other countries were successful in their requests. The Conference agreed, however, that the overall OPEC ceiling of 16m barrels a day (b/d) must remain constant in order to prevent the market from being flooded. No members were willing to accept the reduction in their own quotas necessary to make increases possible for others, while maintaining the OPEC ceiling.

The Ecuadorian delegates boycotted the latter stages of the Conference in protest at the low priority they believed their claim was receiving. (Kuwait, apparently seeking a compromise on the quotas issue, reportedly had suggested that the claims of Iraq and Iran should receive priority consideration, given the state of war between those two countries.) Ecuador, known to be exceeding its 183,000m b/d quota by about 100,000m b/d, announced its intention to continue to produce at its current rate. Moreover, it suggested that it would reassess its membership of OPEC unless its claim was recognised. Iraq, also exceeding its quota, let it be known that it intended to boost its exports by the full 500,000m b/d afforded by the extra capacity from its new link with the Saudi transpeninsular pipeline system.

A decision on individual quotas was deferred until the next conference, scheduled for 7 December 1985, in Geneva. In the meantime, Saudi Arabia was understood to be prepared to constrain its own output in the last quarter of 1985, in order to keep OPEC's overall production within the original ceiling. Saudi Arabia had recently given signs of unwillingness to continue its traditional role as OPEC's 'swing producer'. It had concluded a number of 'netback' agreements with US oil companies (Exxon, Texaco and Mobil), selling its oil at market-related prices. (The netback system sets prices low enough to ensure the buyer a profit after taking into account refining and transport costs.) Saudi Arabia had thus been able to boost its flagging production to around 3.5m b/d, though this remained below its quota of 4.5m b/d. Other OPEC members viewed these developments with alarm, despite the fact that many of them were themselves selling their oil at discounted prices.⁷⁷

●'Either we have to increase the 16m ceiling or someone will have to reduce.' Dr

North-South Monitor

Subroto, Indonesian Minister for Mines and Energy and President of OPEC. *Financial Times* (London) 4 October 1985.

'We have the right to produce what we want. Our quota is not a real one.' Qassim Taki al-Oraibi, Iraq's Oil Minister, arguing that Iraq's quota was set artificially low because of war damage to export facilities *IHT* (Paris) 3 October 1985.

'Iraq does whatever it likes and in most cases it doesn't abide by the rules.' Mohammad Gharazi, Iran's Oil Minister. *IHT* (Paris) 3 October 1985.

'We need an extra quota for peaceful purposes, not to sustain a war.' Fernando Santos Alvite, head of Ecuador's delegation. *IHT* (Paris) 4 October 1985.

'We will increase production as the market demands.' Sheikh Yamani, Saudi Oil Minister. *Financial Times* (London) 5 October 1985.

▲ Organisation of Arab Petroleum Exporting Countries (OAPEC)

Thirty-fourth Ministerial Council Meeting

Algiers, 3 May 1985

■ Delegations from ten member states⁹² participated in a closed session under the chairmanship of the Iraqi Oil Minister, Qasim Ahmed Al-Uraibi.

A press communiqué issued after the meeting⁹³ confirmed the establishment by the Council of two annual prizes for Arab and foreign scientific research of significance to the Arab oil industry and Arab energy. The Council also examined the OAPEC Secretariat's reports on the application of solar energy within the Arab world in heating and cooking, on the oil and gas industry and on other issues.

The Council re-elected Ali Ahmed Attiga as OAPEC's Secretary-General for another three years from 21 September 1985 and agreed to convene its next meeting on 27 November 1985 in Baghdad.⁹⁴

▲ Gulf Cooperation Council (GCC)

Fifteenth Ministerial Council Meeting

Abha, Saudi Arabia, 8-9 July 1985

■ Foreign Ministers of the six GCC states (Bahrain, Kuwait, Qatar, Oman, Saudi Arabia and the United Arab Emirates) reviewed developments in the region and particularly those in the Iraq-Iran war.

According to its final communiqué,⁹⁵ the Ministerial Council determined to continue its support for efforts to bring about a peaceful solution to what it termed 'this devastating war'. The ministers condemned the recent assassination attempt against the Amir of Kuwait, Shaykh Jabir al Ahmad al-Sabah, calling for an intensification of efforts to curb such 'criminal' acts of 'sinful aggression'. They called on Iran to release the ship *Muhurraq* belonging to the United Arab Shipping Company which they said had been detained in violation of international and maritime law.

North-South Monitor

The Council reviewed the recommendations by various ministerial committees in the economic field. It was agreed to convey two of them to the GCC Supreme Council: one allowing GCC producers to market their products directly without the need for local agents and one approving equal treatment in terms of rights and obligations concerning employment for all GCC citizens working in the private sector.⁹⁶

▲GCC

Sixteenth Ministerial Council Meeting
Riyadh, 2–3 September 1985

■GCC Foreign Ministers met to discuss the regional situation and the state of inter-Arab relations following the Arab League summit in Casablanca in August 1985.

According to the final communiqué,⁹⁷ the Council reaffirmed its preparedness to expedite any peaceful solution to the Iraq–Iran war ‘that takes into consideration the legitimate rights of the two sides’. The Council regretted what it described as Iran’s continued refusal to respond to efforts to end the war through negotiation and reconciliation.

Ministers emphasised the importance of Arab unity and of the Arab reconciliation committees formed at the Casablanca summit. They declared themselves ready to play a role ‘in creating the best possible atmosphere and in backing the activities of these committees’. Finally, the Council reviewed the work of various ministerial committees and decided to convene a preparatory session in October 1985 for the November GCC summit in Muscat.

According to the chairman of the meeting, the Kuwaiti Deputy Prime Minister and Foreign Minister, Shaykh Sabah al-Ahmad al-Jabir al-Sabah,⁹⁸ the Council also discussed economic cooperation between the GCC and the EEC in anticipation of a meeting later in 1985 between the GCC Council chairman and the President of the EEC Commission. The two sides have reportedly already held two rounds of talks in Bahrain and agreed to negotiate on four issues: the opening of European markets to Gulf petrochemicals, investment, trade relations and technology transfer.⁹⁹

●‘The situation in our region has not witnessed an improvement that evokes optimism; on the contrary, these days we are witnessing a dangerous escalation which contravenes wisdom and does not respect logic’. Shaykh Sabah al-Ahmad al-Jabir al-Sabah, Deputy Prime Minister and Foreign Minister of Kuwait and chairman of the meeting, to the meeting. *BBC Summary of World Broadcasts*, MF/8047/A/1, 4 September 1985.

▲Cartagena Group of Latin American Debtor Countries
Meeting of Foreign Ministers
Lima, 29 July 1985

■Foreign ministers of the eleven countries in the group decided to adopt a common position on their dialogue with the EEC. This decision followed a meeting

North-South Monitor

at which the group expressed its concern over the increasing protectionism of Western countries, their reduction of new loans and stringent repayment terms.

Having made contact with the EEC in April 1985 and encouraged by its constructive approach to the concerns of Latin American countries, the Foreign Minister of Uruguay and Secretary of the Cartagena Group, Enrique Iglesias, announced that a steering group would lay the groundwork in August for a conference of economic and foreign ministers in Montevideo which would in turn pave the way for an increased dialogue on economic issues with the EEC.¹⁰⁰

▲ Latin American-Caribbean Conference on External Debt Havana, 30 July–3 August 1985

■ Participants at a five-day conference in Havana endorsed calls by the Cuban President, Fidel Castro, for the collective repudiation of the \$360bn debt owed by Latin American countries to foreign banks and credit agencies.

In a message stressing the gravity of the region's debt, its 'unbearable' and 'unpayable' nature, and the unacceptability of solutions proposed by the International Monetary Fund (IMF), President Castro had invited political leaders, academics, economists and representatives of church, trade union and women's organisations to participate in 'a discussion without any prior document and which does not seek to reach agreements or conclusions'.¹⁰¹ The invitation followed regional conferences in Havana of women's and labour leaders, during which President Castro had elaborated possible solutions to the debt problem, in the form of proposals for a debtors' cartel or a debt moratorium. Widely seen as an attempt to seize the leadership of the region on one of its most pressing issues, President Castro's initiative has also been viewed as a further move towards the ending of Cuban isolation in Latin America.

Brazil's leadership, however, was among the first to decline the invitation to send an envoy. President José Sarney announced Brazil's intention to honour its foreign debts, and declared the Cartagena Group to be the proper forum for discussion of Latin American debt.¹⁰² President Miguel de la Madrid, of Mexico (Latin America's second largest debtor country, with a total debt of \$93bn compared with Brazil's \$105bn¹⁰³), similarly refused official representation, rejecting suggestions of a debt moratorium for the region. The Peruvian President, Alan García Pérez, joined the other major debtors, Argentina, Venezuela and Colombia, in refusing to attend. In his inaugural address on 28 July 1985, Alan García had announced his intention to honour Peru's \$14bn debt, but had said that Peru's repayments would be limited to 10 per cent of its exports over the coming year, and that Peru would hold bilateral restructuring negotiations with creditors, thus bypassing the IMF, which he described as 'an accomplice' in the country's economic crisis.¹⁰⁴ He had cautioned, however, that the region's debt problem should be seen in North-South, rich-poor terms, rather than in the context of the East-West conflict. Discontent over foreign debt had been noticeably growing in all these countries, with high interest rates and stringent repayment terms seen as obstacles to recovery in a region largely in recession since 1982. Political leaders had been increasingly expressing their opposition to the austerity programmes prescribed by the IMF.¹⁰⁵ Their rejection of Castro's radical solution in part reflected a perception that the Cuban position was

North-South Monitor

different from other Latin American debtors. Cuba owed sums of money to the Soviet Union, whose 'soft' terms President Castro was unlikely to repudiate, and Cuba had negotiated the third rescheduling of its relatively small \$3bn debt to Western creditors just prior to the conference.¹⁰⁶ In the event, no serving president attended the conference, though there were government delegations from Nicaragua, Guyana and Bolivia, and the 1,200 delegates included several former presidents and prime ministers from the region.¹⁰⁷

In his speech to the conference, and in earlier speeches in Havana, President Castro emphasised a number of points:

- The impossibility of repayment of the region's debt, particularly when Western industrialised countries maintain high interest rates and low commodity prices and protect their own markets.
- The insufficiency of Peru's formula for limiting repayments to a percentage of export revenues, which would not solve the problem.
- The necessity of supplementing debt cancellation with renewed efforts towards the establishment of a New International Economic Order (NIEO).
- The benefits which would accrue to the industrialised economies from increased Latin American purchasing power, particularly in terms of increased employment.
- The futility of transferring resources to the Western countries, which would then use them to finance the arms race, and the US Strategic Defense Initiative.
- The moral right of Latin America to cancel the debt, which had been incurred in most cases by repressive military dictatorships, without the consent of the people.
- The prospect of social and political upheaval across the continent if the burden of debt were not removed.¹⁰⁸

● 'The debt must not be made into an instrument for ideological warfare, or for a confrontation between East and West.' President José Sarney of Brazil. *The Guardian* (London) 24 July 1985.

A debt moratorium is 'out of the question'. President Miguel de la Madrid of Mexico. *IHT* (Paris) 27–28 July 1985.

'This solution may seem attractive at a theoretical or emotional level, but it would be an irresponsible decision because it would have adverse effects on future economic development.' Jesús Silva Herzog, Finance Minister of Mexico. *IHT* (Paris) 27–28 July 1985.

'We will pay the debt, but later on.' President Alan García Pérez of Peru. *The Observer* (London) 28 July 1985.

'It's not that we don't want to pay the debt. We are simply unable to do so.' It constitutes 'economic strangulation'. Freddy Justiniano, Planning Minister of Bolivia, at the conference. *The Times* (London) 1 August 1985 and *The Guardian* (London) 2 August 1985.

'There is no other choice—cancellation of the debt or the political death of the democratic processes in Latin America.' President Fidel Castro of Cuba. *IHT* (Paris) 20 August 1985.

North-South Monitor

▲ Caribbean Community (CARICOM)

Sixth Annual Summit Conference

Bridgetown, Barbados, 1-4 July 1985

■ The annual summit, attended by the heads of government of twelve member-states,¹⁰⁹ was dominated by the issue of intra-regional trade. Trade between CARICOM members had declined by 25 per cent in the previous three years, as a result of increased protectionism and the expansion of imports from countries outside the region. With two of the largest CARICOM members, Guyana and Jamaica, suffering particularly from the recession, the group acknowledged a need to curb the spread of protectionism and to reaffirm the principle of preferential access to each others' exports, although they were able to make only marginal progress towards these goals.

The Nassau Understanding on Structural Adjustment, a joint agreement formed at the previous year's summit in the Bahamas, required the removal of protectionist barriers against selected goods within the region, and the raising of a common external tariff against outside imports.¹¹⁰ By the time of the Bridgetown summit, however, the terms of the Understanding had been applied by only four states, Barbados, Guyana, Grenada and Saint Christopher-Nevis-Anguilla. The other CARICOM states had missed two successive deadlines for the application of the agreement: 1 January and 1 June 1985. They reaffirmed at the summit their intention to implement the provisions they had agreed upon. The summit accordingly fixed a further deadline of 31 August 1985, as specified in the final communiqué.¹¹¹ New liberalised marketing arrangements for primary agricultural products and livestock were, meanwhile, to be established by 30 September 1985.¹¹²

More progress towards the promotion of intra-regional trade was reported to have been made in bilateral discussions.¹¹³ Trinidad and Tobago which had been persistently criticised by other CARICOM members for its increasing protectionism (seen to operate to the detriment of industries such as those in Barbados) agreed to lower its import barriers on all but a few (unspecified) goods.

Another factor seen to be hampering the growth of intra-regional trade was the lack of a regional credit mechanism. The CARICOM Multilateral Clearing Facility (CMCF) had been suspended two years earlier, when it reached its \$100m ceiling. No formula could be found to revive the moribund facility, but the communiqué said that debtor countries undertook to attempt to reduce their indebtedness, in particular by supplying East Caribbean net importers of sugar with their own surplus produce, and transferring the proceeds to the CMCF. This provision was reported to apply mainly to Guyana, the largest debtor, which owed \$70m to the facility. Jamaica, too, was reported to have announced its willingness to pay off its \$4m debt. The communiqué also mentioned the summit's interest in a proposal for the creation of a new trade credit facility, to provide credit for trade in specific products with the potential to be internationally competitive. The summit communiqué endorsed a further proposal to establish a 'third window' within the World Bank, to ensure concessionary financial flows to middle-income developing countries. Smaller developing countries in the region, it said, were being threatened with ineligibility for IDA concessional funds, on the basis of the application of the per capita criterion.

The CARICOM members reaffirmed their support for the sovereignty and territorial integrity of Belize, noting that Guatemala had recently demonstrated

North-South Monitor

more flexibility on the issue of its claim to the territory. The also reaffirmed their strong support for the Contadora process in Central America.

Renewed commitment was made at the summit, both to the floundering West Indies Shipping Corporation (WISCO), and to LIAT, the intra-regional air carrier, threatened by a British takeover attempt. Member-states agreed to coordinate their approach to regional aviation. Other issues discussed included the initiative of the Caribbean Development and Cooperation Committee (CDCC) to focus international attention on the problems of small island developing countries; the Caribbean Basin Initiative (CBI) to foster US-Caribbean trade; the Barbados Consensus on the development of local regional entrepreneurship and skills in the CARICOM member-states; Lomé III; and drug trafficking.

The next regular CARICOM summit was fixed for July 1986 in Guyana.¹¹⁴

● 'Although there was not as much progress as we would have liked, there were some positive decisions on air transport, trade credits and agricultural products,' Bernard St John, Prime Minister of Barbados. *The Times* (London) 6 July 1985.

'Although the first and second target dates were missed, I have seen some movement on this. I hope the momentum will be maintained,' Roderick Rainford, Secretary-General of CARICOM. *Financial Times* (London) 11 July 1985.

▲ Contadora Group

Meeting of Foreign Ministers

Contadora Island, Panama, 21-22 July 1985

■ Foreign Ministers of the four-nation Contadora Group (Colombia, Mexico, Panama and Venezuela) held a two-day meeting to re-launch the peace process in Central America after the failure of a meeting with the deputy foreign ministers of the five Central American countries in June 1985. The June meeting had been convened to consider revisions advocated by the pro-US Central American countries (Costa Rica, El Salvador and Honduras) of security clauses contained in the draft Peace and Cooperation Treaty. It had foundered, however, when the representative of Nicaragua (the only Central American country to agree to the first draft of the treaty in September 1984) walked out in protest at the absence from the agenda of the issues of renewed US aid to the anti-Sandinista Contras, and the US embargo on Nicaragua.¹¹⁵

The agenda for the July meeting remained substantially the same, but in a communiqué issued at the end of the meeting,¹¹⁶ the ministers said they had 'managed to unblock the negotiating process of the Peace and Cooperation Pact in its final chapter which is security in the region'. They agreed on a new plan of action to 'strengthen diplomatic moves' in the face of a worsening of the Central American crisis, and determined to present to the five Central American governments a study of security aspects not covered by the original twenty-one-point peace agreement.¹¹⁷ They suggested, however, that this initiative be matched by negotiations in Panama, to begin by 10 August 1985, on the border tensions between Nicaragua and Costa Rica, and by the resumption of the bilateral 'Manzanillo' talks between the US and Nicaragua, which had been broken off by the US in January 1985.¹¹⁸ During an ensuing press conference, the ministers said that countries wishing to develop

North-South Monitor

mechanisms of support for the Contadora Group could do so, but that there was no need for an increase in the Contadora Group itself.¹¹⁹

Sandinista officials were reported to be encouraged by the wording of the communiqué, which they felt vindicated their claim that their pro-US neighbours had been stalling the peace negotiations by refusing to discuss what they considered to be Nicaragua's legitimate security concerns.¹²⁰

▲ Contadora Group—Contadora Support Group
Meeting of Foreign Ministers
Cartagena, Colombia, 23–25 August 1985

■ The foreign ministers of the four Contadora Group countries met for the first time with foreign ministers from Argentina, Brazil, Peru and Uruguay—the support group was formally formed at the end of July 1985 in response to the Peruvian President's call for a Latin American front to support the Contadora peace effort. They met to explore ways of reviving the Central American peace initiative.

In his inaugural address on 28 July 1985, President Alan García of Peru had criticised US interference in Central America, urging the new Latin American democracies to demonstrate the feasibility of the Contadora process as a means of resolving the region's crisis.¹²¹ While the Contadora Group had reportedly resisted earlier efforts by the other Latin countries to seek a more active role in their initiative, for fear of complicating the negotiating process, their acceptance of the support group was regarded as indicative of the worsening situation in the region. Nicaragua's relations with its neighbours, including the previously neutral Costa Rica, were seen to be deteriorating, and the new involvement of the support group in the peace process signalled growing Latin American opposition to President Reagan's policy *vis-à-vis* Nicaragua.¹²²

In a communiqué issued at the end of the meeting, the eight foreign ministers noted that worsening violence in Central America was threatening to make it the scene of an all-out East–West conflict, and they obliquely warned the US against an invasion of Nicaragua, also urging it to support a negotiated settlement in El Salvador. Convinced that 'Central America's problems cannot be solved by force', they placed a new emphasis on finding solutions to the region's economic problems, proposing a simultaneous drive towards peace and economic reactivation. The ministers stated that the support group would back the Contadora peace efforts by seeking private contact 'with the governments of countries with ties and interests in the region', but how the US and Cuba—to which allusion was most obviously being made—were to be approached was left unspecified. The four Contadora countries, in their turn, determined to seek the immediate agreement of the Central American states to the provisions of the proposed peace treaty, which include the prohibition of arms imports; the expulsion of all foreign military advisers; the establishment of demilitarised zones along border areas; and the possible stationing in the region of a Canadian treaty-verification force.¹²³ All eight signatories to the communiqué agreed to use forums such as the UN and the Organisation of American States (OAS) to encourage the US to make a contribution towards peace in the region.¹²⁴

● 'We are in the drawing-room of a definitive agreement toward a peace treaty.'

Augusto Ramirez, Foreign Minister of Colombia, on arrival at Cartagena's airport. *The Guardian* (London) 24 August 1985.

'It would be illusory to suppose the problems of the region could be solved by the removal of one government.' Bernardo Sepulveda, Foreign Minister of Mexico, when asked at a press conference in Mexico City, immediately before the meeting, for his reaction to a recent article in *The New York Times*. The article reported Reagan administration officials involved in Central American policy as saying that the US could not resolve their differences with Nicaragua while the Sandinistas remained in power. The article appeared in *The New York Times* 18 August 1985, and also in the *IHT* (Paris) 19 August 1985. *The Guardian* (London) 24 August 1985 and *IHT* (Paris) 23 August 1985.

▲ Costa Rica-El Salvador-Guatemala-Honduras

Meeting of Foreign Ministers

San José, Costa Rica, 3-4 September 1985

■ Foreign ministers of Costa Rica, El Salvador and Honduras with the deputy foreign minister of Guatemala attending as an observer, met for talks in preparation for forthcoming meetings with the Contadora Group in September and with the EEC in Luxembourg.

The three foreign ministers signed a joint declaration¹²⁵ in which they argued that the agreements reached by the five Central American countries in their last two plenipotentiary meetings should be added to the text of the draft Contadora peace pact. They also argued for talks aimed at national reconciliation to be effected in certain divided countries through a process of dialogue between governments and their political and armed opposition. The talks would also attempt to reduce military forces and weaponry in the region and to introduce international verification and control.

Nicaragua had apparently not been invited to attend the two-day meeting and most of the issues raised by the three foreign ministers were understood to be directed at that country. The ministers expressed their concern at what they described as the lack of political dialogue between the Nicaraguan government and its various opposition groups and argued that what they termed Nicaraguas's arms build-up had altered the terms of national security in the region.¹²⁶

▲ Contadora Group

Central American Foreign Ministers' Meeting

Panama City, 12-13 September 1985

■ The foreign ministers of the Contadora Group presented to the foreign ministers of the five Central American countries their latest revision of the draft peace plan for the region. One of the most significant changes appeared to be the softening of a provision demanding the immediate removal of foreign troops and advisers from the region, to call for their 'gradual' withdrawal. While Nicaragua had accepted the

North-South Monitor

earlier wording. Costa Rica, El Salvador and Honduras had rejected the initial plan, reportedly on the urging of the Reagan administration, because it would have entailed the removal of US military personnel. A further alteration reportedly resulted in the call for a 'reasonable balance of forces and the establishment of maximum limits on military development' in the region. This provision was in contrast to the earlier freeze on new arms purchases, suggested by the Contadora Group.

The new draft proposal, which appeared to have taken account of some of the objections of the pro-US Central American countries, was presented only days after the leaking of a US report in which the US reaffirmed its commitment to the Contadora peace process, but qualified its support by stating that 'collapse would be better than a bad agreement'.¹²⁷ The Nicaraguan reaction to the new draft proposal was unfavourable, the Nicaraguan Foreign Minister, Miguel d'Escoto Brockmann stating that the alterations in it were 'substantial changes, not refinements'.¹²⁸

A meeting of plenipotentiaries was fixed for 7 October 1985 in Panama City, to allow the Central American governments time to consider the proposals. The Contadora Group stated that the meeting was to last a maximum of forty-five days. If by the end of November 1985 no agreement had been reached on the implementation of the peace plan, the Group said that it would abandon its peace initiative.¹²⁹

▲ Andean Pact

Council of Foreign Ministers: Fourth session
Cartagena, Colombia, 14-15 September 1985

■ Foreign ministers and ministers for trade and development of the five pact member-countries (Bolivia, Colombia, Ecuador, Peru and Venezuela) met in closed session to discuss regional trade and cooperation. They repeatedly agreed an adjustment plan to review for the first time the Andean Economic Cooperation Agreement or Andean Pact which had created the group in 1969. According to the session's chairman, the Colombian Foreign Minister Augusto Ramirez Ocampo, the proposed revisions would cover the operations of institutions, the dealings for tariff exemptions, the industrial development programme and the provisions concerning foreign investment in the region. The ministers decided to draw up a protocol on the revision of the agreement within sixty days of the meeting. It was hoped that the changes would revive the intra-regional trade.

The Council discussed the economic situation in Bolivia, one of the poorest countries within the pact. They also reviewed the most recent border clashes between Honduras and Nicaragua, urging the two countries to settle their dispute peacefully.¹³⁰

● 'This session is very useful and timely, since it shows that the governments of the five countries support the process of integration politically.' Colombia's Foreign Minister, Augusto Ramirez Ocampo. *Xinhua News Agency*, 17 September 1985.

North-South Monitor

▲ Association of South East Asian Nations (ASEAN)

Eighteenth Annual Foreign Minister's Conference

Kuala Lumpur, 8-9 July 1985

■ Foreign ministers of ASEAN (Brunei, Indonesia, Malaysia, Philippines, Singapore and Thailand) pressed ahead with a modified proposal on Kampuchea, despite an initially hostile reaction from Vietnam.¹³¹

The ministers endorsed a new suggestion from the Thai Foreign Minister, Sitthi Sawetsila, for 'proximity' talks (indirect talks through an intermediary) between the UN-recognised Coalition Government of Democratic Kampuchea (CGDK), and representatives of the Heng Samrin régime in Phnom Penh, 'as part of the Vietnamese delegation'. This formulation was a modification of an earlier Malaysian proposal for proximity talks between the CGDK and the Heng Samrin régime, which made no mention of the Vietnamese as participants in the negotiations.¹³²

The new proposal was subsequently conveyed to Vietnam in a joint ASEAN statement on 8 July 1985. According to the final communiqué issued by the ASEAN ministers,¹³³ the objective of the talks would be a political settlement as had been proposed by ASEAN in September 1983, entailing a withdrawal of the estimated 160,000-180,000 Vietnamese troops in Kampuchea; an international control commission to supervise a cease-fire after troop withdrawal; national reconciliation of all warring parties; and UN-supervised elections. Also regarding Kampuchea, the communiqué condemned Vietnam for its illegal occupation and its recent dry season offensive along the Thai-Kampuchean border. It accused Vietnam of forcing civilians in Kampuchea to work in war zones 'which had caused numerous casualties',¹³⁴ and warned of the dangers of 'continuing demographic changes' as a result of Vietnamese settlements and the creation of refugees fleeing from Thailand. The communiqué endorsed a separate Indonesian initiative which linked settlement in Kampuchea with normalisation of US-Vietnamese relations (including the solution to the problem of Americans missing in action, 'MIAs') and reaffirmed ASEAN's support for the CGDK under the presidency of Prince Norodom Sihanouk, urging the international community to aid the CGDK resistance to the Heng Samrin régime.

The Vietnamese reaction to ASEAN's joint statement was detailed in a report in *Nhan Dan*, the official Vietnamese Communist Party newspaper, on 15 July 1985.¹³⁵ The proposal was criticised for its inclusion of the 'genocidal Pol Pot clique' within the CGDK. While the Vietnamese government had begun to express a willingness to negotiate with Norodom Sihanouk of the Sihanoukist National Army (SNA) and Son Sann of the Khmer People's National Liberation Front (KPNLF), it remained adamantly opposed to talks with the existing leadership of the third and strongest faction in the resistance coalition, the Khmer Rouge.¹³⁶ Not only was Hanoi unwilling to negotiate with Pol Pot, but the *Nhan Dan* commentary cited the objection that the Thai amendment to the ASEAN proposal failed to recognise the legitimacy of the Heng Samrin administration, which came to power following the Vietnamese invasion of Kampuchea in 1978. To include the régime's representatives within the Vietnamese delegation was, according to the commentary, a denial of its sovereignty. Vietnam was also anxious to see an end to the sanctuary provided by Thailand for the resistance forces, and the aid supplied to them by China.

North-South Monitor

The thirty-five page communiqué issued by the ministerial conference covered a number of issues other than Kampuchea, including ASEAN's support for a new round of MTNs; the need to increase intra-ASEAN trade; fears of growing world protectionism, in particular, between Japan and the US; and the problem of the drug trade.¹³⁷

● We demand the liquidation of Pol Pot. That can be accomplished by the withdrawal of aid from China and an end to the sanctuary provided by Thailand. In return, we agree to pull our forces out of Kampuchea simultaneously. We do not ask that Pol Pot be killed. He can be exiled in Beijing or Spandau jail . . . Vietnam would, however, agree to an accommodation between Heng Samrin and Prince Norodom Sihanouk.' Nguyen Co Thatch, Vietnamese Foreign Minister, quoted in an interview with *Time Magazine*, *IHT* (Paris) 9 July 1985 and *The Times* (London) 9 July 1985.

The Thai proposal was 'completely out of the question'. Nguyen Co Thatch, quoted by a member of the Japanese foreign ministry, on returning from Hanoi. *BBC Summary of World Broadcasts* FE/7997/A3/5, 8 July 1985.

'We must never say die.' Tengku Ahmad Rithauddeen, Malaysian Foreign Minister (whose original proposal was adapted by the Thai amendment), refusing to accept the Vietnamese comments as a formal rejection. *IHT* (Paris) 12 July 1985.

▲ Kampuchea-Laos-Vietnam

Eleventh Conference of Foreign Ministers

Phnom Penh, 15-16 August 1985

■ The foreign ministers of Kampuchea, Laos and Vietnam issued a communiqué after their conference in which they stated that the gradual withdrawal of Vietnamese volunteer forces from Kampuchea would be concluded by 1990, five years earlier than previously planned.¹³⁸ They qualified the intention, however, by saying that 'appropriate measures' would be taken on consultation between the Vietnamese and Kampuchean governments 'in case the withdrawals are taken advantage of to undermine the peace and security of Kampuchea'.

The ministers did not reject outright Malaysia's proposal for proximity talks, declaring it to be 'an initiative that deserves examination', but they held the question of the participants in such talks to be a matter for discussion between ASEAN and the countries of Indochina. Kampuchea was said to be ready for talks with the Kampuchean resistance 'on the basis of the elimination of the genocidal Pol Pot clique', and the holding of general elections following Vietnamese withdrawal. It was not specified, however, whether negotiations with the Khmer Rouge itself would be possible if its present leaders were removed.

The ministers declared a readiness to negotiate a non-aggression treaty with Thailand, and pleas were made for a normalisation of Indochinese relations with China. An international conference to guarantee and supervise a peace agreement in South East Asia was also advocated. Finally, a forthcoming meeting in Jakarta between representatives of ASEAN and the Indochinese countries was welcomed.¹³⁹

Nguyen Co Thatch, the Vietnamese Foreign Minister, confirmed in a statement

North-South Monitor

that the withdrawal of Vietnamese troops was not conditional upon the elimination of Pol Pot, which was a prerequisite only of a political settlement. However, withdrawal could proceed earlier in the event of a political settlement with the CGDK.¹⁴⁰

● 'If there is Pol Pot or not, it will not change our decision to withdraw by 1990. If there is a political settlement we can withdraw earlier.' Nguyen Co Thach, Vietnamese Foreign Minister, elaborating on the statement of the Indochinese foreign ministers. *IHT* (Paris) 23 August 1985.

▲ OAU Interim Policy Committee for the Special Emergency Fund for Drought and Famine in Africa.

First Session

Addis Ababa, 14-18 May 1985

■ All countries of the twelve-member Committee other than Botswana were represented at the meeting to discuss ways of alleviating drought and famine in Africa.¹⁴¹

Established by a resolution of the twentieth OAU summit in 1984, the Committee was to set up a financial committee to administer emergency aid on the continent. The Committee adopted the statutes of the fund after minor amendments and the procedural rules concerning its special fund to be administered by the African Development Bank (ABD). Also adopted were the criteria and conditions for the approval of grants and loans. The basic criterion of eligibility was to be that the country in question must be affected by drought or famine. The fund would also provide financial and material assistance for national activities and programmes designed to prevent and alleviate the effects of drought and famine. The Committee had studied the initial efforts of African countries which had pledged to make financial contributions (Algeria, Libya and Nigeria had already pledged \$25m and others had offered various amounts) and other possible sources of revenue in Africa and elsewhere. Such resources would be channelled into areas in need of emergency aid.¹⁴²

▲ OAU Liberation Committee

Forty-fourth session

Arusha, 4-6 July 1985

■ The committee condemned the South African regime and the United States for delaying the independence of Namibia. It also deplored Pretoria's aggression against its neighbouring states and the conscription of Namibians into the occupying forces. Stressing that armed struggle was the most effective means of achieving independence in Namibia, the committee urged OAU member states to implement the Arusha plan of action on Namibia through financial contributions to the OAU special Liberation Fund. President Julius Nyerere of Tanzania, the OAU chairman, said that only ten

North-South Monitor

OAU members had paid their contributions in full by the time of the meeting and that annual contributions to the fund were minor in comparison with the task facing Africa. The Committee praised the assistance given by the Nordic and socialist countries in supporting SWAPO.

The Committee expressed concern over South Africa's intention to send a delegation to the UN Decade for Women Conference in Nairobi in July 1985 and at attempts to exclude the issue of the condition of women and children under apartheid from the conference agenda. It urged the international community to prevent South Africa's participation at Nairobi and to ensure discussion of the situation in Southern Africa.¹⁴³

●States bordering on South Africa were 'being pressed beyond their strength and needed financial support to defend their independence'. Julius Nyerere, Tanzanian President and OAU chairman, to the meeting. *BBC Summary of World Broadcasts*, MF/7966/ii, 6 July 1985.

▲Organisation of African Unity (OAU)

Ministerial Council Meeting and Twenty-first Summit Meeting.
Addis Ababa, 10-16 and 18-20 July 1985

■The annual OAU Summit, the first to be devoted exclusively to Africa's pressing economic problems, was marked by the absence of customary political wrangling. A boycott by Morocco and Zaire in continuing protest at the seating of a delegation from the Sahrawi Arab Democratic Republic (SADR) failed to distract attention from the main purpose of the Summit.¹⁴⁴ A draft declaration on the economic situation in Africa was rapidly adopted with only minor alterations, together with a five-year economic programme of action prepared by a seven-nation ministerial steering committee, and approved beforehand by the Council of Ministers.

The 'Addis Ababa Declaration' acknowledged the primary responsibility of Africa for its own economic development. It maintained the OAU's commitment to the objective of African self-reliance, formulated in the 1980 Lagos Plan of Action,¹⁴⁵ but, faced with the immediate crisis in African economies, it determined priorities for the next five years. The bitter experience of famine dictated the return of the focus of African development to farming. The OAU acknowledged the deterioration amongst half its members in the last ten years from self-sufficiency in food to reliance on food aid. Since 1980 food output had grown by only 1.7 per cent, while the average growth in population had been 2.8 per cent, leaving 150 million of the 500 million population to face food shortages. This inadequacy in food production was said to be compounded by drought and natural calamities, and by the problems of refugees and displaced persons. The remedies urged were concentration on food crop production to bring about collective self-sufficiency, through a doubling of investment in agriculture to 20-25 per cent by the end of the decade; the direction of resources such as cheap tools and fertilisers to small-scale farmers, together with the provision of incentives through 'remunerative prices'; a curtailing of the inefficiencies of state-owned enterprises, or their being transferred to the private sector; the establishment of an early-warning system for food shortages, with

North-South Monitor

mechanisms for channelling assistance at an early stage to those affected; and regional cooperation for better use of water resources. The Summit also approved the creation of the OAU's Special Emergency Assistance Fund.

An issue of parallel importance to the revitalisation of agriculture was that of Africa's external debt, set to exceed \$170bn by the end of 1985, with the total debt service in excess of \$20bn for the year. The declaration acknowledged the contribution to the debt crisis of shortcomings in African development policies, but identified the chief cause as an external one beyond Africa's control. It called for an international conference on African debt, and for a Special Session of the UN General Assembly on Africa's economic situation. A plea was made for long-term dialogue with creditors and their financial institutions to bring about economic recovery, and for increased support from developed countries, both through direct aid and more generous rescheduling terms. The tone of the declaration was, however, conciliatory, and it stated that 'we recognise that the external debts are obligations that our members have contracted, and which they have to honour'. A more radical call for the repudiation of debts, or a moratorium, had gained the support of only four states at the preparatory meeting of the Ministerial Council.¹⁴⁶

The five-year programme of action is not binding on states, but an apparent determination to implement its provisions is reflected in the decision to establish a permanent, high-level Steering Committee to monitor progress, study issues concerning African economic development and coordinate African positions in international negotiations.¹⁴⁷

The Summit also addressed itself to the problem of South Africa's destabilisation of the Frontline states, urging African support for their beleaguered economies, as well as for South African liberation movements. The Summit leaders expressed concern over the repeal by the US Congress of the Clark Amendment, which had prohibited US government aid to the rebels in Angola.¹⁴⁸ They repeated appeals to the industrialised countries for the application of economic sanctions against South Africa.¹⁴⁹

The Summit elected the Senegalese President, Abdou Diouf to replace Julius Nyerere as the OAU's Chairman for the coming year, and Niger's Foreign Minister, Ide Oumarou, as its new Secretary-General. The latter appointment broke a deadlock at the previous years' OAU Summits, which had compelled Peter Onu (Nigeria) to remain as Interim Secretary-General.¹⁵⁰

● 'If we fail to agree to implement what we have freely designed for ourselves we would have condemned this continent to a further indeterminate period of economic servitude and bondage.' Peter Onu, retiring OAU Secretary-General. *Financial Times* (London) 20 July 1985.

▲ Economic Community of West African States (ECOWAS)

Seventeenth Ministerial Council Meeting and Eighth Summit Meeting
Lomé, 3 and 5-6 July 1985

■ Heads of government from twelve of the sixteen member-countries of ECOWAS attended the annual summit meeting in Lomé, while Cape Verde, Ghana, Guinea-Bissau and Mauritania were represented at ministerial level.¹⁵¹ The

North-South Monitor

summit, originally scheduled for 28 May 1985 to coincide with the tenth anniversary of the signing of the ECOWAS Treaty, had been postponed at the request of The Gambia and Nigeria, on the grounds that it conflicted with Ramadan. There was speculation, however, that Nigeria was anxious to avoid a meeting with other heads of government from the community so soon after its expulsion of 700,000 'illegal' West African aliens, the second such expulsion within three years.¹⁵²

The opening session of the summit was delayed for a few hours after news arrived of an abortive coup in Conakry, Guinea, whose President, Colonel Lansana Conté, is the current Chairman of ECOWAS.¹⁵³ In his opening speech, President Conté cited the difficult economic environment in the whole sub-region, which was being worsened by drought and desertification, and the need for ECOWAS to concentrate some of its energies on achieving food self-sufficiency. He made no reference to the attempted coup in his country, but left Lomé to return to Guinea soon after the opening session.

The main issue at the Summit was that of free movement within the community. A protocol was approved which provided for cooperation among member-states, to ensure mutual assistance in matters relating to the free movement of persons, goods, services and capital. The free movement of persons at border-posts within the sub-region was also to be facilitated by the issuing by ECOWAS of new travel certificates. The decision was made, however, to postpone the adoption of a draft supplementary protocol implementing the second phase of the 1979 Protocol on the Free Movement of Persons, Right of Residence and of Establishment. This second phase, which was to have taken effect from 1 July 1985, entailed the granting of residential rights to people anywhere in the community over the ensuing five years. It also entailed lifting the restrictions 'justifiable by reasons of public order, public security and public health' on the right of residents anywhere in the community to take up employment. Originally, Nigeria, with the support of Liberia, had requested a two-year postponement of the supplementary protocol, while it arranged its economic affairs. Despite assiduous Nigerian diplomacy behind the scenes, Ghana, Benin and Burkina Faso (whose nationals had notably suffered during the expulsions) argued strongly for the immediate implementation of the second phase, advocating that the majority view and the 'community spirit' should prevail.¹⁵⁴ Presidents Félix Houphouët-Boigny of Ivory Coast, Siaka Stevens of Sierra Leone and Gnassingbe Eyadema of Togo intervened to defuse the potentially destructive tensions between Nigeria and the other ECOWAS countries, and a compromise was eventually reached. By consensus, the summit agreed to postpone the implementation of the second phase for twelve months, to begin on 5 June 1986, with a deadline of four years, President Eyadema then nominated President Buhari of Nigeria as the ECOWAS Chairman for 1985-6. In what was seen as a deliberate effort on the part of President Houphouët-Boigny and the other Francophone states to render Nigeria more 'community-minded' and consequently less likely to engineer more expulsions, the appointment was unanimously approved.

The summit participants went on to discuss economic issues, expressing concern over the prevailing economic situation in the sub-region, with its attendant problems of debt, drought and desertification. It was decided that ECOWAS should attach great importance to solving economic problems, given that it contained seven of the eight member-countries of the Permanent Interstate Committee for Drought

North-South Monitor

Control in the Sahel (ICDCS). A need was recognised to endeavour to strengthen cooperation between intergovernmental organisations tackling these problems.

A final communiqué indicated that the summit had also approved protocols on the temporary importation of passenger vehicles to member-states, and on traffic regulations. It had confirmed the Ministerial Council's appointment of the new Executive Secretary, Momodu Manu of Sierra Leone, of a new Director-General of the ECOWAS Fund, Mahanta Fall of Senegal and of an external auditor, Ahmed Haiba of Mauritania. It examined the report of the *ad hoc* Ministerial Commission on Assessment and Reflection, and mandated the new Executive Secretary and Director-General of the Fund to implement the recommendations of the report from the Ministerial Council session.

Addressing the closing session of the summit, the new Chairman, Major-General Muhammadu Buhari, revealed that since ECOWAS was founded, no more than 50 per cent of the annual budget had been subscribed in any given year. He urged member-states to make regular contributions. He also pointed out ECOWAS's successes in areas such as telecommunications, transport, trade liberalisation, and the free movement of goods and persons, 'despite its attendant difficulties'. Regretting slow progress in agriculture, industrial cooperation and trade, however, he urged improved performance in these areas, and the commitment of greater resources.

The next year's ECOWAS summit was scheduled for 5-7 May 1986, in Lagos, Nigeria.¹⁵⁵

● 'The most noteworthy development on our road to integration is no doubt the implementation of the protocol on free movement of peoples, the right of residence and of establishment. Free movement of peoples has been institutionalised and the next step, the right of residence, will be the real test of our resolve to move ECOWAS from vision to reality. The real question is: are we prepared to surrender a tiny bit of our sovereignty for the good of our community?' Kwesi Botchwey, Ghana's Secretary for Finance and Economic Planning. *West Africa* (London) 15 July 1985, p 1411.

'It was the bone of contention which everyone thought would split the conference'. President Siaka Stevens of Sierra Leone, referring to the supplementary protocol. *West Africa* (London) 15 July 1985, p 1411.

'If we say the pace of our progress is slow, it is because we believe that we are a group of nations that have to be in a hurry because we are starting rather late. If we intend to pull away our people from underdevelopment, we must try to accomplish in a decade what other areas of the world have taken two decades or more to achieve.' President Buhari of Nigeria. *West Africa* (London) 15 July 1985, p 1411.

▲ Council of the Entente of Western Africa

Meeting of Heads of State

Yamoussoukro, Ivory Coast, 10 September 1985

■ The Presidents of Benin, Burkina Faso, Ivory Coast, Niger and Togo discussed at an informal meeting the political and economic problems of the sub-region. They

North-South Monitor

were reported to have condemned acts of terrorism and sabotage in Togo and Niger in 1985, reaffirming the need for peace and stability as essential conditions for development and agreeing to cooperate to combat terrorism.

The Council members also determined economic priorities for the development of hydroelectric energy in urban and rural areas and the promotion of self-reliance in agriculture. They agreed to seek financial aid beyond the sub-region in order to further these aims.¹⁵⁶

▲ Southern African Development Coordination Conference (SADCC)

Fifth Annual Summit, Meeting
Arusha, 9 August 1985

■ The summit paid tribute to its host, Tanzania's President Julius Nyerere, who was to retire at the end of 1985. Seven of the nine member-countries¹⁵⁷ were represented by heads of state or government, with ministerial delegations from Malawi and Swaziland together with Sam Nujoma of the South West African People's Organisation (SWAPO) and Oliver Tambo of the African National Congress (ANC) in attendance.

According to a communiqué issued after the meeting the participants endorsed a progress report covering SADCC's programme of action for the period July 1984–July 1985 and expressed satisfaction with SADCC's achievements towards economic development in all sectors of its programme. They noted that of almost \$4bn required to meet the foreign costs of the programme, \$2.3bn had been either secured or was under active negotiation.

The meeting was chaired by Dr Quett Masire, President of Botswana, whose country had suffered a recent raid on its capital, Gaborone, in which South African soldiers had killed twelve people. The summit condemned the intensification of South African military attacks against its neighbours and its attempts at destabilisation in the region, as well as deploring South Africa's violence against its own people and its continued occupation of Namibia in defiance of international law and opinion. New initiatives were called for to put an end to the current situation in South Africa.

The next SADCC summit was planned for July 1986 in Angola.¹⁵⁸

● 'We need peace, political and military stability as essential factors for the development of the southern African countries . . . we are firmly opposed to the situation of war and destabilising actions carried out by South Africa, who tries to aggravate the difficult living conditions of the peoples in the sub-region of our continent, using all means in its power and particularly the armed bandits to strangle the harmonious development of the region in order to achieve its expansionist policy'. José Eduardo dos Santos, Angola's Head of State, addressing the summit. *BBC Summary of World Broadcasts*, ME/8028/B/8, 13 August 1985.

▲ Tanzania–Zambia

Summit Meeting

Lusaka, 9 July 1985

■ Speaking at the opening of one-day talks with President Kaunda of Zambia.

North-South Monitor

President Julius Nyerere of Tanzania, who was also the OAU Chairman, addressed the problems of African external debt and of Southern Africa.

President Nyerere called on African countries to fight what he termed the new form of economic slavery, through which developed countries give loans to developing countries on terms which only enable them to pay back their debts. He appealed to OAU members to hold discussions with their creditors, and to seek assistance to develop their economies as a means of enabling them to repay their debts. He also assured Zambia that the new President of Tanzania (to be elected later in 1985) would cooperate with the other leaders of the Frontline states, in their efforts to liberate Southern Africa.

President Kaunda said that Zambia would continue to strengthen economic, political and social relations with Tanzania, in order to overcome their mutual economic problems. He said that joint projects such as the Tazara (Tanzania-Zambia railway) and the Tanzania-Zambia pipeline had helped to resolve economic and transport problems in the two countries.¹⁵⁹

▲ Southern African Frontline States

Summit Meeting

Maputo, Mozambique, 15 September 1985

■ The Heads of government of the six Frontline states, Angola, Botswana, Mozambique, Tanzania, Zambia and Zimbabwe,¹⁶⁰ together with representatives of the African National Congress (ANC) and the South West Africa People's Organisation (SWAPO) met to review the situation in Southern Africa.

In a communiqué released after the meeting¹⁶¹ the summit condemned the state of emergency imposed inside South Africa. It called for the immediate lifting of the ban on the ANC and other political organisations and for the release of Nelson Mandela among other political prisoners. These moves, it was said, could bring about conditions for the beginning of talks aimed at eliminating apartheid. The putative South African constitutional reforms and the policy of constructive engagement were said to have failed, and the growing pressure from Western countries including the application of economic sanctions was welcomed. An appeal was made to all countries to increase and intensify such pressure.

The summit reaffirmed UN Security Council Resolution 435 as the only basis for a negotiated settlement in Namibia, condemning the illegal South African-installed regime and appealing to the international community to do the same. The 'linkage' approach, making the withdrawal of Cuban forces from Angola a condition of Namibia's independence, was rejected. The collaboration between the armed forces of Mozambique and Zimbabwe which had resulted in military gains against the Mozambique Resistance Movement was hailed as an important example of Frontline solidarity.

Having paid homage to the outgoing Chairman and President of Tanzania, Julius Nyerere, the summit leaders chose President Kenneth Kaunda of Zambia as the New Chairman of the Frontline states.¹⁶²

▲ Mozambique-South Africa Meeting

Maputo, Mozambique, 14-16 September 1985 and 19 September 1985

■ The South African Foreign Minister, R F ('Pik') Botha, was invited to Maputo for talks with President Samora Machel of Mozambique, on the Nkomati Accord of April 1984.¹⁶³ By the terms of the agreement, South Africa agreed to cease its support for the Mozambique National Resistance (MNR) provided that Mozambique expelled all ANC personnel from the country.

At the meeting President Machel confronted Pik Botha with evidence of South African breaches of the accord. This evidence took the form of documents and a diary by a senior MNR official, A J Vaz, listing material assistance and personal contacts from senior members of the South African government. The documents had been found in an MNR base, following successful attacks by Mozambique government forces, in combination with Zimbabwean armed forces. The diary showed that weapons and ammunition had been supplied regularly to the MNR, and a communications network established, facilitating regular deliveries of food and medicine.

Following hasty investigations by a public commission of inquiry, appointed by the South African President P W Botha, Pik Botha later admitted that South Africa had committed what he termed 'technical' violations of the Nkomati Accord. He did not describe, however, any other possible forms of violation. The purpose of the technical breaches was, he said, to promote peace between the MNR and the Mozambican government. Pik Botha apparently reported the findings of the inquiry to ministerial representatives of the Mozambican government at a follow-up meeting at Komatipoort on 19 September 1985. At the meeting, Pik Botha alleged that ANC members were in Mozambique, some of whom had been arrested in South Africa on leaving Mozambique. He was reported to have assured Mozambique that, in spite of this, South Africa remained committed to the Nkomati Accord.¹⁶⁴

▲ Lusophone African Countries

Ministerial Meeting

São Tomé, 17-19 August 1985

■ Foreign ministers of the five Portuguese-speaking African countries (Angola, Cape Verde, Guinea-Bissau, Mozambique and São Tomé and Príncipe) called on the international community to condemn apartheid and strengthen support for the South African people. In a final communiqué, they accused the South African regime of increasing its suppression of the black majority in the country, of procrastination in relation to Namibian independence and of destabilising its neighbours, thus violating the sovereignty of these countries. The ministers also demanded the unconditional release of Nelson Mandela.¹⁶⁵

Creditworthiness: but at what cost?

'I know that the response to this decision [to devote only 10 per cent of Peru's export earnings to debt service] may be the imposition of sanctions and amendments or, as has already been announced, that the Peruvian debt will be declared value impaired. As President of Peru, I come to say that it is not necessary to wait until October for this. The Peruvian debt is already value impaired. We declared it to be so. What we should ask ourselves is how and by whom was our economy impaired and what historical answer must we give to this situation.'

Alan García's question to the Fortieth Session of the United Nations General Assembly should be the starting point for an honest and critical evaluation by the Third World of how little it has been able to influence the industrial countries towards a new direction in finance, debt and trade more sympathetic to their most urgent needs and development goals. Will the South continue pursuing a course which can only impair its economies further? What purpose is there in continuing the charade of attempting to regain creditworthiness when even the debtors who have tried hardest have not been able to regain the market's confidence?

Since all the discussions concerning access to capital markets, culminating with the Baker Plan, have hinged on creditworthiness, the developing countries must decide what they are seeking to finance—growth or progress? Financing for development will entail deficits rather than trade surpluses in the process of creating an economy less vulnerable to exogenous shocks and better able to respond to changes in the international economy. Securing that resilience cannot be compatible with large debt servicing commitments. But if financing is used only to service interest on debt repayments, the new loans need never leave the creditor banks.

The strategy that has emerged after all the prognoses of the debt crisis moving into a second, more growth-orientated phase is a consensus among the major industrial countries, the World Bank and the IMF that the role of the private sector must be strengthened. Can it be realistic to expect that commercial banks will finance poverty alleviation and human development programmes, when the countries who most need them are the least creditworthy in the perception of the market? There seems even to be some confusion over the role of the multilateral

Republic has endured mainly because it has managed to institutionalise its social support.

Although the three books under review all investigate similar questions, their methodologies and approaches are very dissimilar. Dilip Hiro, the Indian-born writer now living in Britain, has produced a highly readable blow-by-blow account of the revolution, beginning with the last years of the Pahlavi monarchy, going through the downfall of the Shah, and concluding with the consolidation of the Islamic Republic. He also has useful chapters on the American hostage crisis, the Mujahedin challenge, and Iran's foreign relations, especially with the West, the Soviet Union, and the Arab world.

Whereas Hiro's approach is predominantly historical, that of Hossein Bashiriyeh is chiefly theoretical. Bashiriyeh is mainly interested in applying social-science theories of revolution, especially Marxist ones, to the Islamic revolution. The book is sprinkled with quotations not only from Marx, Poulantzas and Laclau, but also from Hannah Arendt, J Davies, Ted Gurr, Samuel Huntington, de Tocqueville, and, of course, Crane Brinton. At times the book is on such a broad theoretical level that it misses the mark. For example, the conclusion argues that the revolution and the emergence of populism in the 1970s are rooted in the world-wide capitalist crisis that began in the 1930s. Of course, such an interpretation would explain most crises in most countries in recent decades. An explanation that tries to explain everything ends up explaining nothing. What is more, Bashiriyeh is so interested in social-science theories that he shows little interest in historical information. For example, Ayatollah Mahdavi Kani is listed as one of the leading members of the ruling Islamic Republican Party (p 157). In fact, he is important precisely because he is not a member of that party while being a close confidant of Khomeini. Similarly, Ardalan—the finance minister immediately after the revolution—is named as an example of 'highranking officials' from the Pahlavi regime who survived into the new regime (p 134). In reality, Ardalan was a survivor not from the Pahlavi regime but from the Mossadeq administration and had spent the years between 1953 and 1979 in the political wilderness. Thus Bashiriyeh's book often tends to read like what it is—a hurriedly published social-science thesis. Despite this drawback, the book has interesting general observations in the chapters on the evolution of the Pahlavi state, the rise of the revolutionary ideology, which it labels Islamic Nationalism, the rule of the fundamentalist clergy, and the much talked about Thermidor.

In one respect, the book by Benard and Khalilzad is similar to that of Bashiriyeh. They are all interested not in Iranian history *per se*, but in applying social-science theories to Iranian history. But whereas Bashiriyeh applies mainly Marxist concepts, Benard and Khalilzad are products of mainstream American political science and are interested mainly in applying conventional social-science theories to the Iranian revolution and investigating why their colleagues failed so abysmally to understand that revolution. The book is

formed of seven separate but extremely well-written essays: 'Crisis in Iran, Crisis in Development Theory'; 'Why Islam?'; 'Iran—What Happened?'; 'Prejudice as a Cultural Weapon'; 'The Islamic Republicans in Power'; 'The Islamic Republicans and the World'; and 'Prospects for Iran'. Especially good is an essay showing that modernisation does not inevitably produce secularisation.

In writing about American political science, Benard and Khalilzad reveal much about their discipline—in fact, far more than they are aware of. They argue—as if it were their very own discovery—that many countries in the Third World have returned to their cultural roots, including their traditional religions, in order to preserve their national identity in the face of Western cultural encroachments. Of course, this would be a new discovery for anyone who had not read Fanon in the early 1960s and a host of Third World writers in the mid-1960s. One should never underestimate the amount of illiteracy prevalent in American political science. Only in such a discipline can one peddle old ideas as if they were newly discovered theoretical constructs. They also scrupulously avoid the term 'imperialism', especially American imperialism, and tend to ridicule Iranians who in 1979 feared US imperialism and a repetition of the 1953 CIA coup. The term 'imperialism', especially 'US imperialism', seems to cause as much consternation in conventional American political science circles as the word 'sex' did at Victorian dinner-tables. If one does not utter the word, maybe others will think it does not exist.

Moreover, Benard and Khalilzad—despite their criticisms of their discipline for being myopic and ethnocentric—themselves tend to see Iran almost exclusively through Western sources. Of the 576 footnotes in the book, less than 20 refer to Persian-language sources—and 12 of these refer to two pamphlets published by the Islamic Republican Party. It is as if an Iranian wrote a book on American politics relying totally on Persian-language sources. This contempt for Iranian sources leads the authors to make factual errors on the rare occasions when they venture into the mundane territory of historical events. For example, Ayatollah Lahuti is described as a 'fundamental cleric' (pp 106–7) when in fact he was a leading opponent of the fundamentalist clerics. The authors also—like many other political scientists—run roughshod over European history to reach their theoretical conclusions. For example, they argue that the Islamic fundamentalists are not like European fascists because the latter valued industrialisation (p 72)—this would be contested by anyone familiar with Nazi ideology and its obsession with *Volk*, 'blood and soil', and a healthy pre-industrial society.

Furthermore, Benard and Khalilzad fall into the fashionable temptation of seeing totalitarianism lurking behind anyone opposed to the US and drawing quick parallels between their 'totalitarianism' and Soviet communism. Thus they eagerly label the Islamic Republican Party as totalitarian and look for similarities between it and the Communist Party of the Soviet Union. This, of

course, ignores a host of major differences. One was forged as an underground organisation dedicated to the bringing about of a revolution. The other was created from the heights of officialdom after the revolution had been achieved. One was a highly centralised and disciplined organisation; the other is a loosely knit group of clerical magnates brought together for electoral reasons by Ayatollah Beheshti—many of these magnates having their own independent base of support in the provinces. In fact, since Beheshti's assassination, the Islamic Republican Party has ceased to exist as a nation-wide organisation and many of these clerical magnates have gone their own way. One could easily find some similarities between Khomeini and the present occupants of the White House and from that conclude that Islamic fundamentalism has much in common with Western neo-conservatism. After all, don't both glorify the trinity of God, Family and Private Property? No doubt if Washington ever reaches a *modus vivendi* with Tehran, conventional political scientists in America will quickly discover—in the manner of Jeane Kirkpatrick—that Khomeini is a mere 'authoritarian' dictator and not a dangerous 'totalitarian'. In this respect, American political science is not rigid and moribund!

Despite their shortcomings, these three books offer much food for thought to anyone interested in the Iranian revolution. Bashiriyyeh is especially useful for those exploring Marxist concepts of revolution, state, class formations, and religious populism. Benard and Khalilzad's book is particularly beneficial for those interested in American social-science concepts of revolution, development, and Islamic fundamentalism. And Hiro's is especially handy for those needing a detailed historical narrative of the revolution.

The novice reader, however, should be aware that Hiro—despite valiant attempts to be politically impartial—often falls into the trap of seeing events through the eyes of his primary sources. And since his primary sources—insofar as he has any—are chiefly members of the present regime, he ends up viewing the revolution very much through the perspective of the existing elite. The book is replete with such examples. Former supporters of the regime who have fallen by the wayside—Bazargan, Qutbzadeh, and Sayyed Javadi—are described as having 'chequered careers' (pp 67, 104 and 218). Foul play is suspected in the death of Khomeini's elder son (p 69)—in fact, not even the senior Khomeini claims that. Five thousand are said to have fallen victim to the Shah's terror in the period between 1953 and 1955 (p 36). This is 4,940 more than the real figure; and the real figure is, of course, 60 more than was morally justifiable. The horrifying cinema fire that burnt to death over 410 people in Abadan during the revolution is blamed on the old regime (p 74). In fact, after the revolution constant protests from the families of the victims forced the new regime to bring to justice the arsonists—and these arsonists turned out to be religious fanatics. Forqan—the extreme religious group that assassinated a number of clerics after the revolution—is suspected of having SAVAK and CIA connections (p 114). Forqan publications, however, show that the group

BOOK REVIEWS

some of these desiderata are not new, the three authors present very convincing arguments for the urgent need to implement them. Policymakers in both industrial and less developed countries should read carefully into these suggestions otherwise we may face the risk of gloomy forecasts becoming a reality.

From the fifth chapter on, the topic of integration becomes the focal point. This is introduced by an interesting paper by Juan Somavía, emphasising the importance of the political aspects of regional cooperation with particular reference to border disputes and democracy. It contains a list of the lines of action which could be taken by the Latin American countries to further the objective of achieving internal and international peace in the region.

The following chapters concentrate on the economic aspects of regional integration with particular reference to several case studies evaluating the results of the CACM, CARICOM, and the Andean Pact in increasing the trade flows among themselves. These are preceded by a general discussion by José Antonio Ocampo and a précis by Dragoslav Avramovic on the causes of the recent collapse of intra-Latin American trade.

Ocampo's article is a most interesting piece. It deals with the financial aspects of intra-regional trade and examines closely what can be considered the most important obstacle at present to increasing trade between the Latin American countries: the system of payments. Ocampo makes the point that intra-regional trade disequilibria have forced deficit countries to reduce their imports from LAIA (Latin American Integration Association) countries. Ocampo analyses the LAIA payments agreement (based on reciprocal lines of credit and multilateral compensation agreements) and attributes the decline of trade flows among Latin American countries to the inadequacy of the available lines of credit, which around 1980 led some countries to operate outside the agreement. This problem was further aggravated in 1982, when the system of coverage was drastically reduced due to the withdrawal of several countries of their debtor balances from multilateral compensation. The chapter concludes by offering several lines of action for reforming the payments system.

However varied the topics dealt with and the variety of opinions expressed throughout the book there were a number of recurrent views and a certain homogeneity in the style of argumentation of several of the authors. For instance: on the diagnosis of the current economic situation and the causes of its steady deterioration; on the desirability of policies geared towards redistribution of income and more autonomous development in Latin America and economic expansion and less trade protectionism in the industrial countries; on the urgency of reforming multilateral lending agencies; and, on the need for the Latin American countries to act more in concert. Even the language used by some of the authors is strikingly similar: 'financial permissibility', 'external vulnerability' of Latin America and its 'insertion' in the international system, not to mention the obvious 'centre' and 'periphery'.

The Nicaraguan revolution's fifth anniversary

Rubén Berrios

Nicaragua: The First Five Years

Edited by Thomas Walker

New York: Praeger. 561pp. \$14.95pb.

Five years of revolutionary experience is still early to determine the achievements of the Sandinistas and to predict the ultimate course they will follow. However, a preliminary assessment can be made and this is what makes Walker's books both valuable and fascinating; it is one of the most comprehensive volumes yet compiled bringing together twenty-six essays dealing with public policy, power, interest groups, economic and social policy, and the international dimension of the Nicaraguan experience. Virtually all chapters are written by scholars with direct field experience in Nicaragua.

The editor of this volume sets the stage in the introduction by tracing the political history of the Nicaraguan revolution. What distinguishes Nicaragua from other Latin American nations is that in a very short time it has undergone significant restructuring of the social configuration of power. The Sandinistas have embarked on a number of social programmes designed to satisfy basic needs. In spite of the problems encountered, this would not have been possible without the popular support they enjoy. The challenge of running a revolutionary system is a hard lesson to learn and mistakes have been made. Moreover, in attempting to preserve pluralism and a mixed economy, the non-cooperative and often confrontational behaviour of dissatisfied minorities is still a major obstacle to social change.

As the editor stresses, the philosophical or ideological foundation of the new system was a matter of considerable controversy. From the start, the former privileged minority and their allies, such as the pro-business newspaper *La Prensa* and the conservative hierarchy of the Catholic Church, regarded the Sandinistas as communists who would trample over private property and suppress civil liberties. These accusations were further fuelled by conservative forces in the United States. For instance, the platform of the Republican Party in 1980 denounced 'the Marxist-Sandinista takeover' in Nicaragua, and in 1981 the Reagan administration mounted a campaign to convince public opinion that Nicaragua was a 'Marxist-Leninist totalitarian state'.

According to Walker and the writers dealing with the issue (LeoGrande, Malley, Maxfield & Sholk), the reality of the situation, however, was different. The Sandinistas adhere to the ideology of *Sandinismo* which is a heterodox blend of Marxism, nationalism and Christianity. There are Marxists in

resistance and wanton acts of destruction. We are opposed to terrorism because we are the victims of terrorism. Any armed resistance can be condemned as a terrorist activity. This is how we are seen by the Western/American/Israeli mass media. But there is a fundamental difference between terrorism and armed resistance. It is the right of the people of any nation facing opposition, occupation and racism to offer resistance by all means. The United Nations Charter gives them this right. The real terrorists are the invaders and the occupiers of the lands of the Palestinians.

AG: *Does this make violence or armed resistance synonymous with the right to self-defence?*

ARAFAT: Actually, we are doing no more than defending ourselves. The aggressors have the upper hand in the mass media. Take the case of the *Achille Lauro*. We received official requests from the Italian Government that we should work with the Italians and the Egyptians and other Palestinian groups to safeguard the lives of 400 passengers and the crew of the ship. We did that and nobody thanked us for it. Instead the media built a great story about the killing of one American on the ship. The truth is that the Americans never thought that the passengers would be saved and they were planning to make a great issue out of it. But when the ship was brought to the harbour and the passengers were released they thought the world might give us some credit for it. So they built a propaganda campaign around the death of Leon Klinghoffer to discredit the PLO. But when the Jewish Defence League killed an American of Palestinian origin, Alexander Odeh, the Western media took no notice of it.

The amazing thing is that the Americans expect the PLO to control all the acts of all the Palestinians. I am presented to the world as a superpower who should be held responsible for everything that happens anywhere in the world in which any Palestinian is involved. Reagan was himself shot at by an American citizen and Kennedy was killed by an American citizen but that did not make all Americans terrorists. If the US government cannot control all the acts of every single American, how am I expected to control the acts of every single Palestinian? You have the Red Brigade in Italy, the Baeder Meinhoff Gang in Germany, the Red Army in Japan. but that does not make all Italians, Germans and Japanese

rapid growth. In fact, within a year of coming to power, the Sandinistas had doubled the number of countries with which it had relations. The socialist and non-aligned countries are now important trading partners of Nicaragua.

Prior to 1979, Nicaragua's small open economy had strong trading and financial links to the markets of the United States. They have tried to redress this dependence, seeking ties with a wider and more diversified range of trading partners. Parallel to the growth of these ties, a deterioration of US-Nicaraguan relations has occurred. As the US suspended its economic aid to Nicaragua, the Sandinistas sought assistance from and expanded their economic links with the socialist countries. However, taking a lesson from the Cuban experience, the Sandinistas tried to avoid dependence on the socialist countries and instead sought relations with as many countries as possible. The chapters in this section examine Nicaragua's relations with the United States, the communist states, the Non-Aligned Movement, Western Europe (and the Socialist International) and Latin America.

The final part of the book, the epilogue, is an excerpt from the Report of the Latin American Studies Association (LASA) delegation which observed the 1984 Nicaraguan elections. This is an historically important document, drafted by a delegation of a major professional organisation of thousands of scholars who study and teach about Latin America. According to the report, by all objective measurements the Nicaraguan elections were considered cleaner, fairer, and more democratic than those held in El Salvador a year earlier.

The articles are sometimes uneven in quality but on the whole the book itself is a well-balanced assessment of the first five years of Sandinista rule. The significance of the book is that it addresses a wide range of issues. Although ambitious, it is often an informative book and should be of interest to those concerned with Nicaragua. It is also mainly aimed at explaining the Sandinistas's case. If the book gets the attention it deserves, it should prompt an interesting debate.

Pakistan's past

Nicholas Mansergh

The Sole Spokesman: Jinnah, the Muslim League and the Demand for Pakistan

Ayesha Jalal

Cambridge: Cambridge University Press. 1985. 310pp. £27.50

In the preamble to Pakistan's first Constitution, Mohammed Ali Jinnah was described as the 'Creator of Pakistan'. It is as 'Creator' or architect, that he is

passing into history, that basic ascription remaining virtually unchallenged. But interest, and with it, historical enquiry, is coming to focus on how he came to fill the role of Quaid-i-Azam, the 'Great Leader', and how, when he had done so, he had envisaged the state of which he was later deemed to be the creator. Did he think of the Pakistan which was his goal as a component co-equal with Hindustan in a federation whose common purposes were confined to foreign affairs and defence, or as a separate state conforming territorially to existing provincial frontiers, or as one delimited by an act or acts of partition? Behind these particular questions and conditional on the answers to them lies the critical personal and as yet suspended judgement on whether, with the emergence of a bifurcated Pakistan on 15 August 1947, Jinnah is to be regarded as having succeeded or failed in his ultimate purposes. What were his aims?

The publication of Dr Jalal's study, probing and scholarly in approach, and well-grounded in sources—both British and Pakistani—which have recently become available or more accessible, is an important, perhaps the most important, contribution yet to this developing debate. It disposes of simplistic notions of Jinnah as a predestined leader advancing by stages to a predestined goal. Neither, the author stresses, may be thought of with such assurance. All, or almost all, was contingent upon tactics, manipulation, and the interplay of aspirations and interests within a Muslim leadership more strongly entrenched, until the penultimate phase, in the Muslim majority provinces than was Jinnah in the all-Indian scene. Jinnah, she demonstrates conclusively, did not move from a position of strength but rather, despite potential in terms of popular backing, from a position of marked weakness.

Dr Jalal's analysis is on two levels, the first wide-ranging and general, the second particular and personal. On the first is 'the central problem' to which her book addresses itself, namely, 'how did a Pakistan which fitted the interests of most Muslims so poorly come about': and the second, the complementary one (as the author graphically phrases it in relation to the 1940 Lahore Resolution) that of 'teasing out' the inwardness of Jinnah's strategy and so identifying 'what he actually thought to be the real solution to the hard political problems of sharing power within India'. It is by concentration upon the second that Dr Jalal seeks to throw significant new light upon the first.

Jinnah was a moderate in politics and the fusion of religion and politics in the Khalifat movement alienated him from the Congress under Gandhi's leadership. He was, however, also a Nationalist, concerned with the share of power Muslims, as by far the largest of the minorities in India, should have in self-governing India. He noted without satisfaction the trend in British policy in the 1920s and 1930s, progressively to enlarge the area of provincial self-government without corresponding concessions at the centre. Himself lacking a secure provincial base, he perceived that it was the centre that would be crucial were India to remain one. Not for him the Punjabi Muslims'

construct of India's future, playing states' rights against a weak federal centre. On the contrary, he had to move on an All-India base or there was nothing. From that there followed the developing conviction that the divided and part-moribund organisation of the All-India Muslim League must be resuscitated with Jinnah himself as its spokesman.

After the 1937 provincial elections, it looked as though provincial party interests in the Punjab and Bengal would consolidate their position, and in a self-governing India counterbalance, or overbalance, a weak centre. But the outbreak of war changed all that. The Viceroy wanted an all-India counterweight to the Congress. Jinnah seemed best fitted to provide it. It was that new assessment that opened the way for the 1940 Lahore Resolution.

Dr Jalal sees the Resolution as a bargaining counter which had the merit, from Jinnah's point of view, of being acceptable to majority province Muslims and totally unacceptable to the Congress and the Raj. 'This,' she adds by way of explanation more sophisticated than any that was at the time entertained, 'in turn provided the best insurance that the League would not be given what it now apparently was asking for but did not want'. Yet at Lahore, Jinnah, by redefining the problem in terms not of accommodation of minority with majority but of separate nationhood and consequent parity, changed the perspective. Dr Jalal, however, makes no claim, as has Professor Wolpert in a recent biography¹ that Jinnah foresaw the sequel. On the contrary, she concludes that Jinnah's inscrutability was to be attributed not to foresight but to the weakness of the hand he had to play. Rightly, she concludes that Jinnah's aims are to be unravelled the hard way by analysing his tactics.

Dr Jalal specifically repudiates the notion that her study is an essay in provincial history. Nonetheless, her analysis owes much to her chapter on Jinnah and the Muslim majority provinces, which opens up a new dimension in the explanation of this crucial aspect.

Dr Jalal's analysis of the 1945 Simla Conference which came to nothing—that was Jinnah's good fortune—and the Cabinet Mission, whose proposals for grouping at least envisaged territorially the Pakistan to which Jinnah aspired, lead on to her perception of the 'tragic collapse' of Jinnah's strategy with the descent into communalism in its cruder forms that shadowed the last months of British rule. And then to Attlee's decision to quit India, without first conceding the principle of a Pakistan with its frontiers generally conforming to provincial boundaries—not that anyone could seriously have supposed he would do so. By contrast, the Mountbatten Viceroyalty is taken at a hectic pace that may have been thought fitting for its subject, with the tone dismissive as if all options were closed. This is the least satisfying part of a study of outstanding interest.

On one point one might enter some reservation. If the League leadership, Liaquat as well as Jinnah, entertained such pronounced misgivings about

¹ S Wolpert, *Jinnah of Pakistan*, New York: Oxford University Press, 1984

Pakistan's survival potential as their quoted words suggest, Liaquat at least concealed it well in the spring of 1947, though he did then think the British were leaving too quickly. And, on another, a correction. It was not on 18 August but on the morning of 16 August 1947, that the Boundary Award, its publication already delayed, was circulated to members of the Defence Council and on the afternoon of that day discussed by the Indian Pakistani leaders. By then, time was of the essence.

Proliferation problems

Ben Schiff

Nuclear Proliferation Today

Leonard S Spector

New York: Vintage for Carnegie Endowment for International Peace. 1984. 478pp. \$5.95pb

Safeguarding the Atom: A Critical Appraisal

David Fischer and Paul Szasz, edited by Jozef Goldblat

London: Taylor and Frances for Stockholm International Peace Research Institute. 1985. 243pp. np

Nuclear Proliferation Today is a useful review of the present state of global nuclear proliferation. It is the most comprehensive recent study of the spread of nuclear weapons, bringing together a wide range of published information and expert observations on nuclear weapons development programmes in many countries. It dwells on capabilities while putting forward a worst-case analysis of national intentions with regard to further nuclear development.

Spector's book is authoritative, timely, clearly presented and wide-ranging. It can serve as a useful starting point for discussions of appropriate responses to the proliferation problem. The implication of the analysis is that proliferation continues to be a major international threat, that international measures taken so far to stem proliferation are inadequate, and that regional and local imperatives are the primary motives that lead states to pursue the development of nuclear weapons.

While these implications are generally accepted among observers in developed states interested in controlling nuclear proliferation, they give short shrift to the arguments of others who regard horizontal proliferation to be in

part the product of major power arms races, and who regard proliferation to be a minor sideshow to the major issues of East-West and North-South conflict. The Spector report represents the moderate centrist arms-control view of US anti-proliferation officials and activists.

This volume was planned as the basis for annual update reports which will follow. Such a 'non-proliferation annual' will be a welcome contribution to the non-proliferation debate, easing the problem of collating the masses of information that appear in the press and from governments in this important area. As a snapshot of nuclear capabilities and potentials of non-nuclear weapon states in 1984, it is an invaluable work.

Nuclear Proliferation Today devotes very little space to international efforts to control proliferation. The SIPRI volume, *Safeguarding the Atom: A Critical Appraisal* is a major contribution to discussion of the efficacy and future of the international non-proliferation regime. Written primarily by the former Assistant Director for External Relations of the International Atomic Energy Agency (IAEA), David Fischer, the book provides an excellent overview of current IAEA safeguards practice. The appraisal is 'critical' in that it draws on Fischer's long experience in the IAEA to point out the weaknesses of the system and to make proposals to reinforce it. *Safeguarding the Atom* serves as an excellent sequel to earlier books on the IAEA's safeguards system, notably Alan Knight's, *Atomic Safeguards: A Study in International Verification* (New York: UNITAR, 1971), and Benjamin Sanders, *Safeguards Against Nuclear Proliferation* (Cambridge, Mass: MIT Press for SIPRI, 1975). It describes the current safeguards framework clearly and concisely, including texts of relevant treaties, IAEA documents, and a list of NTP member states in a useful set of appendices.

Fischer's co-author, Paul Szasz, a UN legal expert and former IAEA employee, argues that international organisations in general, and the IAEA in particular, are not capable of coercive authoritative sanctions. Although Szasz's analysis comes at the end of the volume, the argument is basic to the rationale for the IAEA that Fischer pursues in the rest of the book. Fischer argues that the Agency's safeguards system effectively verifies that states that have promised not to divert nuclear materials from declared facilities are in fact living up to their commitments, and that the threat of exposure of illicit activities does contribute to the retardation of nuclear proliferation.

Fischer attacks critics of the IAEA who declare it ineffective or irrelevant by demonstrating that it is increasingly successful at carrying out the limited mission for which it was established. He challenges those who argue that it is impossible for the IAEA simultaneously to promote and safeguard nuclear technology. Unlike national nuclear authorities, the IAEA should not be divided into two separate agencies to promote and control the technology. The 'AEA is not analogous to domestic regulatory organisations because it cannot coerce or enforce behaviour. The Agency's promotional activities are not

primarily in the nuclear power area, but rather in medical and agricultural applications of isotope technology and in health and safety: it is not working at cross-purposes. Safeguards themselves should be seen as a promotional activity, because the safeguards system has made major nuclear exporters more willing to transfer technologies that they might otherwise limit.

Fischer's summary of IAEA safeguards rules and procedures includes suggestions for improvements that knowledgeable observers will recognise as policies he promoted when he worked for the Agency. Politically innovative and realistic, Fischer's proposals continue to merit serious consideration and action. He believes that the Agency's efforts should be based on a more explicitly political set of objectives, including the maintenance of its own credibility.

The political aim might perhaps be to confront a would-be NWS [nuclear weapons state] with such a risk of detection that it would prefer to withdraw from the NPT [Treaty on the Non-proliferation of Nuclear Weapons] . . . it [the IAEA] must avoid the risk of giving ammunition to its critics by setting quantified aims that are so exacting that the IAEA cannot in practice achieve them . . . yet being perfectly able to force any would-be NWS [nuclear weapons state] to come out into the open rather than to cheat (p 45).

The IAEA inspectorate could be improved if proportionately fewer inspectors came from nuclear weapon states, more from neutral states, and if the inspectorate could become rather more careerist: the current two-year terms for inspectors reduce the continuity, experience, status and salary levels of the inspectorate.

Fischer believes that Third World states' emphases in the IAEA upon technical assistance are based on misperceptions of reality. Nuclear power is *waning in importance in the developed countries, and even more so in the Third World*. The IAE itself can never become a major technical assistance organisation, because the technology is simply not a high priority for most developing countries. Especially because of its tremendous capital intensity, nuclear power will appropriately remain a minor aspect of North-South technology transfers. Secondly, Fischer argues that Third World diplomats' notion that nuclear proliferation is a remote threat is mistaken. The states that represent the most immediate proliferation threat—Argentina, India, Israel, Pakistan, South Africa—constitute regional Third World threats much more than they do threats to the central system. For Fischer, then, it is the Third World that should be most concerned about the security aspects of nuclear proliferation.

Fischer considers the developed nuclear supplier states to be largely at fault for the misperceptions of other countries. They originally oversold the desirability of nuclear technology, creating demand for technology transfers out of proportion to its need. When they reversed course and became increasingly concerned with proliferation, they acted largely without consultation or agreement with Third World countries, and created opposition

where it could have been avoided. Fischer believes that the 'un-selling' of nuclear power will be a slow process, but the inclusion of Third World states in multilateral non-proliferation efforts (within and outside the IAEA) should be a guiding principle for the future, and unilateral or exclusively supplier-state initiatives should be avoided.

Fischer joins other non-proliferation enthusiasts and observers of the IAEA who decry the politicisation of the Agency and, in particular, its Board of Governors. Claiming that Third World control of the Agency will reduce its ability to take appropriate actions to extend safeguards and this will in turn reduce supplier state support for the Agency, Fischer endorses the extension of IAEA activities and tightening of its rules through actions taken at the sub-political levels of the secretariat. He sees no chance that the IAEA's Statute can be usefully modified, or that the Board of Governors can be both a representative and relatively apolitical body.

In his review of the major innovations in safeguards and proposals for future institutional mechanisms for controlling proliferation, Fischer offers a quick overview of the important initiatives of the last decade. Curiously he omits the activities of the IAEA Committee on Assurances of Supply, which was supposed to work out a code of behaviour to depoliticise supply controls in the wake of the US Nuclear Non-Proliferation Act of 1978 and unilateral supply cut-offs threatened against states not complying with US (and Canadian) export control legislation.

These two books present a useful if still partial view of the international non-proliferation regime. The Spector book presents the non-proliferation status quo in an appropriately alarming light, assembling masses of useful information into a highly readable and accessible form. It is largely bereft of a careful discussion of non-proliferation measures or a serious description of Third World perspectives of the problem. The Fischer and Szasz book authoritatively describes the IAEA's safeguards system and its limitations, including useful suggestions for its modification. Fischer and Szasz address many of the important political and technical issues facing the IAEA and thus the NPT, but the perspective is still very much a 'First World' view. Together these two volumes provide excellent information on the current state of nuclear proliferation. They will serve as definitive starting points for others' discussions of non-proliferation responses.

When Shridath Ramphal became Commonwealth Secretary-General, he inherited from Arnold Smith a Secretariat with most of its functional divisions established and their work defined. It was, and is, a small Secretariat, not capable by itself of making any major impact on international development or international economic reform. Moreover, neither the Secretariat, nor the Secretary-General was meant to arrogate to themselves executive functions. That is, they existed to respond to and service the expressed needs of Commonwealth governments, and they could not determine by themselves what those needs might be. Furthermore, the Commonwealth style of inter-governmental consultation, from the heads of government summits down, was based on consensus and typically resulted in uncontroversial or extremely general communiqués. In sum, Ramphal and his Secretariat could, on the face of things, expect little clear and radical direction from Commonwealth governments, particularly on international economic questions where, except in the most general expressions of unity, a division

existed between the Northern and Southern members; nor was Ramphal meant to determine, in any manner reminiscent of executive action, what direction the Commonwealth as a whole, he or his Secretariat should move in; and, finally, the Commonwealth Secretariat was too small for effective movement in radical directions anyway.

Added to all this was the very nature of the Commonwealth organisation. It had no charter like the United Nations. In its place it had a general Declaration of Principles which had been agreed by heads of government in Singapore, in 1971. The organisation to which Ramphal was called as Secretary-General had an amorphous structure and, the value of its generalised form of consultation aside, had very little real justification for its existence, or real evidence that it had developed fundamentally away from its historical genesis.¹

Ramphal has, since his appointment (and two re-elections), brought the power of his personality to play, and has made himself so formidable an asset to the Commonwealth that Margaret Doxey has written that 'the Secretary-General is probably the contemporary Commonwealth's major resource.'² What he has done is to have brought the tenor and personality of a 'proper' international organisation to the Commonwealth. As Sir William Dale pointed out, international personality is acquired, 'rather than inherited genetically from the constitution of the organisation'.³ The acquisition of international personality for the Commonwealth has been Ramphal's undeclared but discernible mission, making the generalised form of consultation and the lack of a charter into advantages rather than obstacles. The aim of the present paper is to explain one of the methods used by him to involve the Commonwealth in the struggle for international economic reform, despite Northern reservations and resistance to the entire New International Economic Order aspiration.

The instrument to be described here is the Commonwealth Group of Experts. There have been two types of expert groups. A 'Commonwealth Team of Experts' was despatched to Uganda, very shortly after Amin's fall, at the request of President Lule. In a virtuoso two-month performance, the team improvised a comprehensive and breath-taking report on how Uganda's economy might be rehabilitated.⁴ The Ugandan team has been the only one of its kind. The other category of expert group originates in a different fashion. These expert groups have produced seven reports from 1975 to 1984, the period under review here. The experts themselves are prominent

¹ I have tried to deal with some of these issues in: Stephen Chan, 'Three birds of different feathers: the Commonwealth, the Commonwealth Secretary-General, and the Commonwealth Secretariat', *The Round Table* (291) 1984

² Margaret Doxey, 'The Commonwealth Secretary-General: limits of leadership', *International Affairs* 55(1) (1979), p. 82

³ Sir William Dale, 'Is the Commonwealth an international organisation?', *Commonwealth Law Bulletin*, 9(2) (1983), p. 654.

⁴ *The Rehabilitation of the Economy of Uganda* (2 vols), London: Commonwealth Secretariat, 1979.

Commonwealth academics and/or public figures, and may be described as members of an 'inner circle' in international life, their advice being much drawn upon by a number of agencies. Figures such as Bernard Chidzero, Tommy Koh, and Kenneth Dadzie have featured. Some experts have served on more than one group. Professors A D Brownlie of New Zealand, Stuart Harris of Australia, H M A Onitiri of Nigeria, and Sir Alec Cairncross of the United Kingdom have all served on two groups. Canada's Professor G K Lelleiner has also served on two; three counting the Ugandan team. And Sri Lanka's Lal Jayawardena holds the record for having served on five groups.

How it all works

Ramphal became Commonwealth Secretary-General in 1975. In 1973, OPEC nations forced a massive increase in the price of oil; Third World nations, meeting in Algiers, called for a New International Economic Order. In 1974, at the Sixth Special Session of the UN General Assembly, this call was adopted by the world's largest international organisation. There seemed to be a trend, and the Commonwealth had, in some way, to be cognisant of it. Firstly, many of its members were being badly affected by the rise in oil prices; secondly, the Commonwealth Heads of Government, meeting in Jamaica in 1975, wanted to continue the 'spirit of Ottawa', a cordiality and unity achieved at their last meeting in 1973, which contrasted markedly with the two days of extremely sharp debate over British arms sales to South Africa at the 1971 Singapore meeting, and the differences of approach over Rhodesia at meetings before that; among the Northerners, Britain at least wanted to avoid acrimony at the Jamaica meeting; thirdly, apart from the call of the UN General Assembly's sixth Special Session, the Lomé Convention had recently been concluded, embracing a great deal of the Commonwealth membership, and was being heralded as a model of international cooperation to which the Commonwealth had, at least, to genuflect.

This was all a trend with which Ramphal had been deeply involved, having been a prominent Third World spokesman in the negotiations leading to Lomé. His own interest in economic reform, coupled with the economic circumstances of Commonwealth nations and the mood at the Jamaica meeting, led to an initiative spearheaded by his friend and West Indian colleague, Michael Manley, who chaired the Jamaica meeting. The approach was innocuous. The meeting commissioned a Commonwealth group of experts to study the programme steps necessary for progress towards a new international economic order. This was the first of the seven discussed here.

The reports of these expert groups simultaneously originate from Commonwealth Heads of Government Meetings (CHOGMs) and sidestep them. A CHOGM commissions their work, and the next CHOGM receives completed reports. The commissioning CHOGM will contain Northern members happy to refer potentially divisive issues to expert committees; the

receiving CHOGM need only note that an expert group has reported, share the general concern of the report, endorse in (again) general terms aspects of the report, then commend itself for having furthered the debate on international economic reform. At this stage, the Secretary-General will notify the need for a further report. The effect is a cumulative one. Without CHOGMs ever formally adopting a programme of action, involving a concert of Northern and Southern Commonwealth nations, they appear deeply concerned with the progress and technicalities of the North-South dialogue. Because CHOGMs are summit meetings, the reports and their recommendations appear to carry the imprimatur of presidents and prime ministers. Because it is the Secretary-General who suggests topics for study, or prompts sympathetic heads of government to suggest certain topics; and because it is he who selects the experts who will report, the whole process has become a neat device to advance the New International Economic Order theme, and to cover it with the cloak of ostensible Commonwealth support.

An analogy with the Brandt Commission

In a very real manner, the expert reports perform the sort of work that the Brandt Commission involved itself with, notwithstanding the higher public profile of the Brandt Commission and the political eminence of its commissioners. The Commonwealth experts serve on their groups in their private or individual capacities; they do not represent their nations. Similarly, Ramphal served as a Brandt commissioner in his private capacity, and not as Commonwealth Secretary-General. Ramphal would not have been selected as a commissioner, however, had it not been for his work, through the Commonwealth, on international economic issues. The fact that the commission, in the closing stages of report-writing, ensconced its own secretariat in Commonwealth Secretariat offices, and that Ramphal then played a major role in drafting its report, lent an even greater impression of Commonwealth concern, if not direct involvement, in the economic issues of the day. Perhaps it was only an image that was being massaged, but the similarity in tone between the Brandt report and the Commonwealth expert group reports is apparent.

If there is a similarity in tone, there is also one in the weaknesses of the reports. Brandt was as savagely criticised as it was welcomed, and some of the most severe criticism came from development specialists who might have been supposed to be sympathetic to its effort. Michael Lipton, while saying that the report had its essentials right, and was the best report available, nevertheless pointed out a number of its technical deficiencies, the fact that it was academically flawed, and that the report would be criticised for having treated far too broad a canvas.⁵ Dudley Seers complained that the report attempted to premise its argument on a mutuality of interest between North and South, and

⁵ Michael Lipton, 'Brandt: whose common interest?', *International Affairs* 56(2) (1980).

then to assert that this mutuality had a moral base—therefore an improved North–South dialogue would mean an improved international morality.⁶ Hans Singer noted that the report really said nothing new, and that it was, in any case, a curiously North-Western document, with none of the authors/commissioners having been drawn from the Soviet Union and China.⁷ Michael Tribe commented that the report failed to recommend practical action to implement its view of mutuality,⁸ a view also expressed by André Gunder Frank, whose comments along with those of other radical critics suggest that the real international debate is not about a transfer of resources, but a transfer of power.⁹

All of these complaints might be equally applied to the Commonwealth expert group reports—although one of them is not an area the Commonwealth can do anything about, since neither the Soviet Union nor China are Commonwealth members. Indeed, with no communist nation in its membership, and despite an ostensible condition of non-alignment for many of its members, the Commonwealth is a sort of North-Western and South-Western association of nations. The Southern nations are, in any case, bound by debt and other dependencies to the North-West, and they have certainly not demurred from the international Keynesianisms of the expert group reports, nor or their own premises of morality and mutuality.

A unique Commonwealth purpose

The question as to whether the Commonwealth expert group reports have improved the world, enhanced its moral tone, or contributed significantly and positively to the North–South dialogue will be addressed more fully later in this review. They have, however, played a role in changing the character of the Commonwealth, and in lending it the image of an organisation whose progress has been from colonial hangover to spokesman for its poorer members. They, together with the Secretary-General's official and private activisms, have defined a new Commonwealth and have sought to institutionalise this newness.

Although the Commonwealth has the 1971 Singapore Declaration of Principles in place of a charter, it is in fact something more than a declaration in substance. 'It embodies, amongst other things, an agreement to follow certain principles, and to take certain kinds of action.'¹⁰ Since 1971, however, CHOGMs have released other declarations; all of these declarations have been made within Ramphal's term of office; all of them may be seen as elaborating

⁶ Dudley Seers, 'North–South: muddling morality and mutuality', *Third World Quarterly* 2 (4) (1980).

¹⁰ Dale, *op. cit.*, p 647.

the original Singapore Declaration, in a cumulative exercise of adding more and more flesh to the generality of the parent declarations—of making the 'certain principles' more specific, as well as the 'certain kinds of action'. Taken together, the collected declarations begin to resemble a charter, and seek to impart a legitimacy, a kind of legal documentation, to the Commonwealth's acquired international personality.

The four elaborations are: (1) the 1977 Commonwealth Statement on Apartheid in Sport (Gleneagles Agreement); (2) the 1979 Lusaka Declaration of the Commonwealth on Racism and Racial Prejudice; (3) the 1981 Melbourne Declaration, concerning international economic issues; and (4) the 1983 Goa Declaration on International Security. It is the Melbourne Declaration that concerns us here. It is itself a general statement of concern, and commits the Commonwealth to nothing other than a certain tenor in its world view—and does not commit Northern members to anything at all. But the tenor of this world view is the same tenor to which the expert group reports have been striving; the 'larger moral' view is emphasised, as is the 'Mutual interests and interdependence of all nations'.¹¹

Seen in this light, the Commonwealth expert group reports have had, if nothing else, a uniquely Commonwealth impact—not to improve economic conditions for individual Commonwealth nations, but to strengthen the Secretary-General's conduct and refurbishment of the Commonwealth as an international organisation.

The reports

Each report has been known by the name of its chairman. Hence we have the McIntyre report (1977),¹² the Campbell report (1977),¹³ the Arndt report (1980),¹⁴ the Cairncross report (1982),¹⁵ the Akporode Clark report (1982),¹⁶ the Helleiner report (1983),¹⁷ and the Lever report (1984).¹⁸ In general, the reports have enjoyed a polite press; descriptive accounts of them have appeared in specialist journals;¹⁹ the Cairncross report was touted as sure to 'arouse considerable interest at the annual meetings of the World Bank and the IMF, as well as the next session of the UN General Assembly'²⁰ (as the Arndt report was also meant to do at the 1980 11th Special Session of the UN General

Assembly—except that it was not made available in time); and some chairmen have undertaken their own publicity.²¹ The reports are known in development and international economic circles, and form part of the mass of briefing carried by negotiators and bureaucrats. Have they, however, any substance that makes the exercise of producing them a rewarding one?

The reports have had their own evolution. The first, the McIntyre report, was clearly conscious that it was breaking new Commonwealth ground, and went through two interim versions before its final publication. Since then, the production of reports has become more assured and deft, but their style has vacillated from those painted on a very broad canvas—examining ‘the world economic crisis’—to those dealing with reasonably specific issues such as protectionism, or a programme of reforms for the Bretton Woods institutions. The broader a report’s concern, the more it reads like a political brief; and, to a certain extent, all the reports have this characteristic—they denominate the arguments of a politically and economically liberal approach, without deeply elucidating these arguments or engaging opposing arguments. But the point here is that some reports are broader, less argumentative, and less likely to alter debate—because of not truly being *in* debate—than others.

A second evolution may be noted. When the process of commissioning these reports began in 1975, there was a genuine, if hopeful, clamour for a New International Economic Order. Seven years later, it was apparent to all that this crusade could not succeed. The approach of the 1982 Akporode Clark group is in startling contrast to the early assumptions that large-scale economic reform was possible. I wish to consider the Akporode Clark report more fully below.

The fact that the crusade for a New International Economic Order has been unsuccessful does not necessarily mean that the Commonwealth expert group reports have been unsuccessful with it. Much of what they raise can be used in the incremental negotiations recommended by Akporode Clark as a substitute for confrontationalist negotiations demanding across-the-board international economic changes. Even so, some of the more spectacular failures of the entire NIEO campaign, such as the search for a Common Fund—which the Third World sought so avidly at the 1979 UNCTAD in Manila, having conducted preliminary strategy meetings in Arusha, only to see its proposals distorted to the point of inversion at Geneva in 1980—have meant also the total disregard by North-Western nations of entire expert group reports, such as the Campbell report on the Common Fund. Campbell, as a consolation point, may have assisted Third World nations in defining the sort of Common Fund they sought—but they did not get it. The Commonwealth, moreover, is not a Third World organisation.

The lack of effectiveness of some reports is due not only to political factors,

²¹ eg Harold Lever, ‘The Debt won’t be paid’, *The New York Review of Books* 31(11) 28 June 1984.

Claude Cheysson, was quoted as saying 'The Group must be put to sleep, being unable to carry out faithfully its mandate.' The SWAPO President, Sam Nujoma, welcomed the decision, describing the group as 'paralysed by linkage'.⁷¹

Despite claims by remaining Contact Group members that it was somehow still functioning or in abeyance, the French withdrawal has effectively marked the end of its negotiating role. Thenceforth the British, West German and Canadian governments left it to the US Under-Secretary of State for African Affairs, Chester Crocker, to pursue attempts to achieve a Namibian settlement linked to a prior or parallel Cuban withdrawal from Angola. The UN Security Council decision against linkage, which Britain voted for but the US abstained from, in October 1983, was simply ignored by these two governments. The British position was more obscure than that of the US. The British Minister of State for African Affairs, Malcolm Rifkind, while refusing actually to endorse the linkage, nevertheless contrived to support the position of the US with the tortuous argument that while the ending of the Cuban presence was 'not, and never has been a precondition for a Namibian settlement', his government was of the opinion that 'we cannot ignore the political reality that the withdrawal of Cuban troops would create a better atmosphere for a wider settlement', an issue to which 'both the US and South Africa attach importance'. Margaret Thatcher was more forthright after Botha's visit. On 5 June she said bluntly in Parliament that Namibian independence 'will not occur until there is, in parallel, also the withdrawal of Cuban forces from Angola'.

Prospects for independence

After Botha's European tour, however, the joint US-SA strategy gradually began to unravel. SWAPO's delicate handling of questions arising from the Angolan-South African agreement in Lusaka, and its scrupulous refusal to comment on what it accepted as the domestic concern of the Angolan government, avoided any suggestion of a rift. Its participation in the Lusaka talks with the MPC and South Africa, at the invitation of Zambian President Kenneth Kaunda, and its emergence strengthened by the support it attracted from other internal Namibian parties, as well as its obvious flexibility in contrast to South African intransigence, left it with an enhanced reputation for reasonableness.

⁷¹ *The Times* (London) 7 December 1983.

identify issues peculiar to themselves or a small group, and to negotiate for incremental benefits on these issues. Perhaps particularly sympathetic Northern nations will seek to help, incrementally, certain Southern nations on certain issues. In this way, more progress will be made through what the two American academics call 'coalitions and alliances that cut across North-South lines' than in the present North-South dialogue.²⁴ They do not think the North will, in this way, seek to divide the South. There are, however, no guarantees in this matter.

Conclusion

The reports of the Commonwealth Groups of experts have helped to devise a Commonwealth more in keeping with the concerns of its majority membership; and which appears implicated, in detail, with these concerns. In this way they have helped a certain democratisation of the Commonwealth. Simultaneously, they have helped to develop the organisation from one with *ad hoc* concerns and agendas to one where the agenda is reasonably constant.

In organisational terms, they have helped to turn the Commonwealth from an inter-governmental body of a purely responsive sort, within the limited compass of its abilities at the disposal of its members, to something more fully representing an international organisation with its own deliberate, discernible, and at least partially executive character. In short, they have helped the Commonwealth become an international actor.

None of this is harmful. In fact, the entire drive behind this transformation has been frequently explained by the Secretary-General: it is because the Commonwealth, in its transformed persona, can contribute to international affairs at large; and its composition, of both North and South, can serve as a model to the wider international community.²⁵

Taken by themselves, however, the expert group reports have not succeeded in their ostensible purpose—to assist the international negotiating process, and to provide new varieties of thought which could be adopted by the negotiating parties and implemented. The effort has been brave, the results stimulating but marginal. The reports have strengthened the Commonwealth. They are not yet that organisation's contribution to international relations.

Politics, Power and Revolution: An Introduction to Comparative Politics

Peter Calvert

Brighton, England: Harvester Press. 1983. 208pp. £18.95. £6.95pb

Revolution and International Politics

Peter Calvert

London: Frances Pinter. 1984. 222pp. £15.75

Professor Calvert of the University of Southampton is a prolific author with a particular reputation in Latin American studies, especially Mexico. These two books speak to the dual title of his chair: Comparative and International Politics; and both are informed by his knowledge of South and Central America. *Politics, Power and Revolution* offers a brief (174 pages of text) introduction to comparative politics (and governments) 'freely' based on lectures to second-year students but aimed at travellers, businessmen and diplomats as well as undergraduates. Although covering the ground of a textbook, Calvert is 'a good read'. The style is, as he says, discursive, though never diffuse; often entertaining and even to those inured to the subject-matter not infrequently percipient. As someone who never quite knows where to pitch lectures for those who are fresh (or jaded) from first-year studies but not yet driven by the fear of Finals, I regard Calvert's students as fortunate.

The book broadly follows a systems perspective but commendably devotes three chapters to analysis of threats to the maintenance of existing polities. Inevitably, the treatment whets the appetite rather than sates it. In particular, the treatment of revolution is cursory and a trifle idiosyncratic. Not many would agree that Chalmers Johnson is the 'most useful of the sociological taxonomies of revolution' (p 167); and puzzlingly there is no reference to Barrington Moore or Theda Skocpol. Overall there is a touch of blandness about the perspective whose normative origins in the optimism of structural functionalism come through clearly in the five concluding pages: from 'basic forms of government . . . there have grown up in a slow process of historical evolution those elaborate structures of government which today exist and are clearly continuing to evolve in new ways in fulfilment of needs not previously seen . . .' (p 173). I wish I could be so sure.

Revolution and International Politics, unusually, has no preface but the tone and style are so similar as to lead one to suppose it to be a companion volume, albeit the publisher is different. The book aims, 'to explore the nature of revolution in the context of international politics, and by doing so, to cast new light on the nature of international politics today.' In awareness of the semantic problems Calvert adopts a wide definition of revolution. I do not myself buy the notion that revolution is 'quite simply, the politics of violence' (p 199), but his canvas requires the broad brush. As with the previous book, the perspective is systems theory, and the method largely taxonomic. The scene is set with discussions of force in the international system, of wars of national liberation and 'the culture of violence'. Calvert then tackles the psychological and sociological explanations of leadership before discussing 'three forms of revolutionary action'—the coup (?), guerrilla warfare and urban insurrection. Throughout there is a wealth of illustration both historical and contemporary which gives texture as well as, on occasion, entertainment.

The remainder of the book reflects on what is to be done about cuckoos in the international nest: diplomacy and revolution; aid and intervention; and counter-insurgency. The (again) brief conclusion can be even more succinctly summarised: 'Don't panic; and make sure your government doesn't either.' Indeed but after the Falklands/Malvinas episode (on which Calvert has also written) I cannot be so sanguine as Professor Calvert about the rationality of Western leadership nor the enlightenment of democratic citizenry.

Mountbatten: The Official Biography

Philip Ziegler

London: Collins. 1985. 786pp. £15.00

Rarely can an official biography have been written so free from taint of officialdom! The author tells us that to him the phrase meant that he had his cake in the form of unrestricted access to Mountbatten's personal archive and could eat it in the sense of consuming as much or little of it as he thought right. To both, the finished work bears testimony. Mountbatten kept everything irrespective of importance. Mr Ziegler placed on his desk a reminder that 'In spite of everything he was a great man'. He did not doubt this was so: he feared only lest the cumulative evidence of Mountbatten's preoccupation with the trivial might disturb the balance of his biographer's judgement. Mountbatten read little but relaxed by poring over the details of his genealogical tree (fittingly in part reproduced in the endpapers to the book) showing his descent from Charlemagne and his relationship to most of the royal houses of Europe.

Yet, as Mr Ziegler brings out so well, the traditionalist outlook one might infer was not there on matters of moment. On the contrary, once embarked on his career, Mountbatten inclined left, as even more so did his wife Edwina who brought with her in unusual association great wealth inherited from her father, Sir Ernest Cassel, and the humanitarian outlook of her great-grandfather, the Victorian reformist Earl of Shaftesbury. To Mountbatten, all the doors were open but when it came to conflict between naval career and counter-attractions, Mountbatten never hesitated. He was determined to succeed, the popular explanation of a resolve to redress the wrong done to his father when driven from the Admiralty in 1915 because of his Germanic origins, being, in Mr Ziegler's view, the right one; though one suspects being a younger son had also something to do with it. In World War II his gift for getting out of hazardous situations, into many of which he should never have entered, brought him a richly merited reputation for leadership and courage that bordered on the reckless. As Chief of Staff of Combined Operations, he was brought into touch with Americans with whom he got on well and that was a factor in his further dramatic advancement to Supreme Commander South-East Asia. This in its turn ushered in the years of the achievements by which he will be best, and would have most liked to be remembered, he himself recording a wish that if there were to be any memorial address at his funeral—the detail

of which he had planned with characteristic thoroughness—it should be devoted to his time in South and South East Asia.

The story of those years is arrestingly told in chapters that are a contribution to history. Among things that stand out is Mountbatten's freedom from racial prejudice. It was coupled with imaginative sensitivity. I believe his gesture in inviting Pandit Nehru, recently released from jail, and visiting Singapore as representative of the Indian National Congress, to ride with him in his car in what became a triumphal procession, may have changed the course of history. As the Indian Agent remarked: 'It showed the fine imaginative sensibility for which Lord Louis is so justly famous.' India followed, with the Nehru-Mountbatten friendship as a feature of the transfer period. There Mountbatten's critics were, as in South East Asia, to the right, with many members of the ICS unforgiving to a Viceroy who introduced a new approach and speeded up a process which they thought had already been unduly foreshortened by Attlee's statement of 20 February 1947. On this, historical debate will long continue. My own impression in the spring of 1947 was that delay would have invited even greater disaster. On allegations of Vice-regal influence on the *Boundary Award* or *Kashmir*, Mr Ziegler sets out fairly what he has been able to learn but for the rest exercises a wary restraint in judgement.

In subsequent years, Mountbatten achieved his naval ambitions, became Chief of the Defence Staff, protested at Suez (composing two letters of resignation, neither of which, however, he felt able to post) and while in retirement he attacked the idea of tactical nuclear weapons to stop an advancing enemy.

Mr Ziegler's biography is immensely readable. It is also a work of art, at times memorably felicitous in treatment and phrasing.

NICHOLAS MANSERGH

St John's College, Cambridge

Women, Men and the International Division of Labour

Edited by June Nash and Maria Patricia Fernandez-Kelly

Albany, NY: State University of New York Press. 1983. 461pp. \$49.50. \$14.95pb

In the past decade a number of studies have been made on the emergence of a 'new international division of labour', characterised primarily by the relocation of industries to the low-wage countries of the Third World and a subsequent rise in manufactured exports from these sites to the advanced capitalist countries. While there has been considerable debate over the attempts to analyse and predict the changing relations in the international division of labour (IDL), a factor mentioned only in passing is that these changes have primarily affected women workers in both hemispheres. The industries involved in this process, ie electronics, textiles, have been predominantly female intensive and the new production sites have drawn in a new labour force of young, often unmarried women. Numerous case studies on the world market factories in South and South East Asia and Latin America clearly reveal that the IDL is increasingly based on a sexual division of labour. However, what has been lacking in all

these studies (an exception is Elson and Pearson 1981) is the theorisation of why this phase of restructuring in the world economy is based on the specific exploitation of female labour and what implications this has for organisation and international solidarity.

This collection of papers is significant in that it takes precisely these focal questions and examines the ways in which the IDL has sharpened contradictions between men and women, minorities and dominant racial and ethnic groups in both hemispheres. The papers are grouped into four parts covering global accumulation and the labour process, production, reproduction and the household economy, migration trends; and case studies on electronics and textile factories in the US and the Third World.

On the basis of a comparative analysis of MNC production plants in the US and the Third World, the papers examine the effects of the IDL. Geographical imbalances and the dislocation of families and communities has led to the breakdown of cooperative community networks and the destruction of subsistence economies. Employment avenues have stimulated the movement of women into the border cities of Mexico as men are pushed back from the US (M P Fernandez-Kelly, J A Bustamante). Colombian garment workers migrate to the high-wage areas in Venezuela using ethnic identity networks to survive (M Berlin). The changing demand for male labourers in foreign corporations in Brazil has meant tremendous pressure on the agricultural estates and *barrios* as family options for residence, alternative employment for women and family size are affected (N Aguiar). The stress of all these changes is borne by the household as women struggle over reallocation of their labour between reproduction and production. A comparison of US and Brazilian garment-workers shows that while there are differences in family size, both groups of women put their domestic responsibilities first in the context of impending unemployment. The strictures imposed by the IMF in Jamaica forced Kingston women factory workers to adjust their reproductive and productive functions by including extended kin members to ensure the survival of their households (L Bolles).

The fuel for this phase of capital accumulation then, like that of early nineteenth-century industrialisation is provided by female labourers. The answer to the question of 'Why specifically female labour?' is often tautological—i.e. because women are cheap labour. The clue to the cheapness of female labour must be found by moving out from the sphere of visible production to the invisible private sphere of the family. It is only by linking the organisation of production processes and labour markets to the sexual division of labour that the predominantly female character of global manufacturing can be understood (Susan S Green). While the segmented labour market model introduced the dynamics of class into dual labour market theory, it is socialist feminist theory which has stressed that the social relations in the family unit (male dominance) have shaped the social valuation of female labour power. Women can be paid lower wages (below the value of labour power) as a consequence of the assumption of economic dependence on men. This valuation has no connection with the skill or productivity of women workers. It is thus the 'comparative disadvantage' of women, determined by patriarchal relations within the family, which gives them an 'advantage' in global manufacturing (L Lim). It follows then that the simple equation, employment equals emancipation for women, is inadequate unless patriarchal relations are confronted both within the family and the factory. This becomes crucial in the context of the resurgence of 'homeworking' in this phase of global accumulation. Katz and Kemnitzer and J A Alonso show the rise of

homeworking in Silicon Valley, California, and in the garment industry of Mexico. The existence of the 'diffused factory', far from being a pre-capitalist remnant, is part of the present restructuring of capital, based on the sexual division of labour and the ideology of the housewife.

The central theme of this collection is that the terms of the relationship between the First and the Third World have changed. The sharpening of sectoral differences within the labour force implies that the simple centre/periphery dichotomy (with a flow of accumulation towards the centre for the benefit of all in the First World) no longer holds water. Workers in the US are in direct competition with low-paid and often unorganised workers in the Third World today as there is increasingly unemployment (on both sides) and decreasing social welfare and workers' control over the workplace in the US. The national basis for industry-wide negotiations in the US has broken down, while unions continue to protect mainly the *primary* labour force. The secondary labour force is in fact harder hit by international trade than the *primary* labour force. (A problem unexplored in this connection is the implications of the new homeworking for union strategies based only on factory production).

In the Third World, on the other hand, export-led industrialisation has not created employment or higher wages except in the short run, while national policies guarantee 'tax holidays' and subsidies to attract foreign investment. This process is often accompanied by militarisation. And when this is combined with the foot-loose, impersonal MNC and its faceless corporate hierarchy it makes confrontation difficult.

The scenario presents a gloomy future of industrial stagnation and unemployment world-wide, ending with the unconvincing hope that the IDL will engender consciousness of class interest on an international scale (J Nash). Although, however, the editorial article gives the impression of a consistent framework, there are in fact *two* approaches running through the book.

An alternative to the approach sketched above is provided by R Snow and L Lim. Snow's article on the US workforce in the electronics industry shows that since offshore sourcing began, overall employment has increased though the composition of the workforce has changed. Production workers and women have lost jobs while immigrants have taken blue-collar jobs and displaced workers have moved into the service sector. Industrial restructuring has altered the composition of the workforce. Secondly, a certain percentage of manufacturing in electronics still remains within the US itself and therefore industrial work will continue to exist and expand. Linda Lim's paper links up the three structures that constitute the IDL, ie capitalism, imperialism and patriarchy. She argues, firstly, that manufacturing for export is not solely due to the presence of multinationals and, secondly, that wages can rise over time, working conditions improve, local linkages are generated and (unlike the early stages of labour-intensive manufacturing for export) there is, in some developing countries, the possibility of national capitalist development and an indigenous industrial class that lays the basis for industrialisation and capitalist growth.

The rest of the articles seem to support either one or the other of the two approaches presented in the thematic section. For instance, van der Mark shows the aftermath of footloose industrialisation in Curacao, where women lost their craft skills by working in electronics factories only to find themselves unemployed when the firms closed down. On the other hand, Hu Tai Li's analysis of small-scale industry in a Taiwanese rural community shows that family-owned auxiliary factories operating as suppliers of larger

export-oriented domestic factories or trading companies are a response both to the limitations of local agricultural production and the demands of the larger international economy.

While both approaches to the IDL make a break with dependency theory, they remain within the trap of circulationist and production-oriented theories which are either partial or misleading. Critics have pointed out that the world-systems approach fails to see the tendency of capitalism to expand through increasing relative surplus value, neglects technical innovation and demand conditions, and sees reduction of wages (hence, a cheap labour pool) as the only way of restoring the rate of profit. This is only one way and, in fact, low wages in the Third World do not necessarily mean a higher rate of profit (which depends on productivity). The IDL is thus limited to the model of the world market factory (electronics or textiles) in the free-trade zones while, in fact, export of capital is still predominantly between advanced capitalists. Production-orientated theories suffer from assuming a uniform and integrated process of capitalist development without going into the specific forms of surplus appropriation and local class struggle.

Different approaches have varying implications for organisation and international solidarity. Some of the articles analyse the contradictions that arise when women workers have organised in the world market factories, but there is no mention of attempts at building worker networks across plants of the same multinational corporation and producer-consumer networks which have emerged as possible strategies for action.

In spite of such shortcomings or ambiguities, this book is significant in that it stresses the international character of the accumulation process by a comparative analysis of industries in the First and Third World and it also shows the inadequacy of the notion of a 'homogenous working class' in the face of racial, ethnic and sexual divisions.

AMRITA CHHACHHI

Institute of Social Studies, The Hague

Third-World Diplomats in Dialogue with the First World: The New Diplomacy

Robert J Moore

London: Macmillan (in association with International Development Research Centre, Ottawa). 1985. 179pp £7.95pb.

Guyana's former High Commissioner of Canada has reflected upon his personal experience in order to prepare a sort of handbook for fellow Third World diplomats. It is the kind of book that leaves one eager to meet the author, having been captured by his wit, his sound judgment, and his commitment. In one sense it is an old-fashioned type of book about the craft of diplomacy, but Moore's notion of a 'new diplomacy' revised and reconceptualised to meet the needs of poor countries gives the work freshness and verve.

Foreign ministries should buy up the book and distribute it to their foreign-service officers. They will get all kinds of practical advice on how to throw a memorable diplomatic reception, how to cultivate the media, the voluntary associations, and the

universities in their host countries—all in the cause of promoting a New International Economic Order. For Moore, diplomacy remains the art of persuasion, but he formulates a modern brand of 'expository' diplomacy in which Third World representatives strive to create Northern constituencies sympathetic to Southern development.

Moore's goal is not to write a scholarly analysis of the North-South dialogue so much as a brief on behalf of a lean, vigorous, effective Third World diplomatic corps. He criticises, the aristocratic diplomatic tradition of 'competitive lavishness' in favour of a spare but dignified celebration of national culture. He offers numerous proposals by which to train and maintain a well-informed body of diplomatic officers whose substantive mastery of the issues is the best form of advocacy of Third World interests. Through this work, Moore shows himself to be an exemplar of the 'balance between burning conviction and dispassionate exposition' that are for him the Third World ambassador's highest credentials.

ROBERT A MORTIMER

Haverford College, Pennsylvania

The Emerging International Economic Order: Dynamic Processes, Constraints and Opportunities

Edited by Harold K Jacobson and Susan Sidjanski

London: Sage Publications. 1982. 293pp. £19.50

The New International Economy

Edited by Harry Makler, Alberto Marinelli and Neil Smelser

London: Sage Publications. 1982. 336pp. £17.95

On first examination these two books seem very similar. They are both collections of articles about the international economy and its bearing upon the process of development. They both emerge from international conferences held in 1979. They both have the same publisher, appeared in the same year, and have almost identical textual formats. Moreover, the two books refer to roughly the same body of social-scientific literature, and contain about the same mixture of empirical and theoretical materials.

But, despite these similarities, the two books under review are really quite different in purpose and in content. The volume edited by Jacobson and Sidjanski (henceforth called *Emerging Order*) is sponsored by the International Political Science Association, and this disciplinary affiliation is evident in its construction. The themes unifying the articles contained in *Emerging Order* are (1) the decomposition of the global economic system which emerged from World War II - a system characterised by relatively free trade, specialisation of production among countries, and United States economic dominance --and, (2) efforts by Third World countries to improve their position in the international economy through pressure for a New International Economic Order

(NIEO). About half of the papers deal with organisational aspects of NIEO, and policy questions appear in almost every chapter.

The volume edited by Makler, Martinelli, and Smelser (subsequently called *New Economy*) has a different disciplinary affiliation, being sponsored by the International Sociological Association. It is somewhat less concerned with issues of formal organisation, concentrating instead upon problems raised by dependency theory. Many of the papers collected in *New Economy* discuss transnational corporations, and most of the authors seem at least moderately sympathetic with the ideas of dependency theory.

An edited collection of papers will almost inevitably be uneven in quality. I find papers presenting new empirical information more valuable than those exclusively concerned with conceptual or methodological matters.

Four papers in *Emerging Order* impress me as particularly useful. Robert Jordan considers the motivation behind NIEO and the nature of the NIEO demands. Although these demands have been reformist rather than revolutionary, the developed nations—and especially the United States—have been dubious if not resistant to them. Third World countries generally prefer multilateral assistance programmes, but, in reaction to the NIEO proposals, Britain, the United States, and West Germany are presently offering mainly bilateral assistance.

The politics of protectionism as it pertains to the US steel industry is examined in a paper by Robert Walters. As a matter of general principle American policymakers prefer free trade, but structural shifts in international production sometimes unleash strong pressures towards protectionism. Both industry and US government economists oppose an activist role for the state in economic affairs. Such opposition encourages protectionist policy as a means by which the state can deal with disadvantageous structural shifts without assuming an activist role. Lynn Mytelka considers a similar range of questions with respect to the French textile industry showing how, between 1945 and the present, big capital aided by the state consolidated its hold over French textiles. In the process, organised labour was denied any significant role in industrial planning. These changes would supposedly increase the efficiency of French textile production, but today the industry is still not competitive on the international market, and faces a rather uncertain future.

To my way of thinking, the most interesting paper in *Emerging Order* is Kuniko Inoguchi's analysis of Third World responses to OPEC. Although non-oil-exporting Third World countries were often economically injured by the 1973 OPEC price increases, they usually supported the OPEC price offensive because, in the larger scheme of things, it seemed a hopeful self-assertion by the South against the North. Inoguchi defines a variety of possible Third World responses to the oil price increases and, using regression analysis, studies the conditions determining each response type. For example, Third World countries severely disadvantaged under usual trade conditions and suffering a sharp increase in the cost of oil imports after 1973, were prone towards forming commodity cartels modelled after OPEC. On the other hand, Muslim countries with economic ties to OPEC members were likely to seek OPEC aid.

Turning our attention to *New Economy*, four papers therein deserve special attention. Volker Bornschier summarises a systematic programme of research on the new forms of dependency brought about by the spread of transnational corporations. Under these forms of dependency the core controls technology, innovation, and active capital while the periphery engages in routinised production. Multiple regression

analysis suggests that the penetration of Third World countries by transnational corporations diminishes subsequent economic growth while increasing income inequality. Paradoxically, restrictions on transnational corporations hinder short-run economic growth and thus tend to be unpopular even when they have a salutary effect upon long-range development.

The impact of transnational corporations on the state and class structure of Third World societies is discussed by Alberto Martinelli. Transnational corporations, he concludes, benefit from the combination of politically diverse nation-states and an integrated world market. They erode, at least to some extent, the sovereignty of nation-states, and they certainly weaken the position of labour, frequently setting one national labour movement against another. The transfer of technology by transnational corporations, to the extent that it occurs, has not lessened the gap between developed and underdeveloped countries.

Over the last fifteen years, private banks have provided an increasing share of the financial support received by Third World countries. Barbara Stallings examines the political consequences of transnational private finance in the Third World. Private bank loans divide the Third World by creating a group of peripheral countries willing to help the centre to moderate Third World protest. Banks also undermine progressive governments in the periphery—eg Allende in Chile, Velasco in Peru, Manley in Jamaica—while often supporting reactionary regimes—eg Pinochet in Chile, Mobutu in Zaïre, the military government in Brazil. While stressing the political significance of transnational finance, Stallings also emphasises the linkages between the latter and internal social classes, thus avoiding the tendency of some dependency theorists to interpret underdevelopment entirely as a consequence of external forces.

An interesting complement to Stallings' paper is Harry Makler's analysis of credit allocation in the Brazilian north-east. Makler finds significant empirical regularities in which entrepreneurs receive credit. For example, credit is generally extended to foreign-born managers of technically complex enterprises, but not to family-owned enterprises in dynamic sectors of the economy. Moreover, the main perpetrators of these social divisions in credit allocation are government banks.

The most important shortcoming of these two volumes is the absence of strong controversy within them. When dealing with issues of development and underdevelopment there is clearly opportunity for sharp difference of opinion, but such differences rarely surface in *Emerging Order* or *New Economy*. Most contributors seem to have a liberal or leftist position, and appear generally sympathetic to dependency theory analysis. Since this coincides with my own orientation it may seem an odd thing to complain about. Nevertheless, I believe that scientific understanding of underdevelopment (and dependency theory as well) would be better served by a larger dose of controversy than the editors of these volumes have chosen to include.

As noted at the outset, both *Emerging Order* and *New Economy* emerged from conferences, but their published form does not reflect the most constructive features of these origins: namely, dialogue, criticism, and the opportunity to exchange opinions. The value of these books would be increased by several orders of magnitude if each paper were followed by comments from other conference participants and a response by the author. Naturally, this would also increase the editorial work by several orders of magnitude, but the readership might also be extended.

The closest thing to controversy and dialogue in these volumes is the epilogue to *New*

Economy by the political scientist, Charles Lindblom. Reflecting upon the papers contained in that book, Lindblom questions whether capitalism is a suitable concept for analysing the international economic order, and recommends disaggregating the latter into the market system and the private enterprise system, the former being defined as a regime of mutual control and adjustment. He faults the contributors for failing to distinguish between capitalism and the market system, and for assuming that there exists an alternative to the international market system with participants other than nation states and corporations. No such alternative exists now or in the conceivable future, and this renders much of the criticism of the international economic system presented in *New Economy* (and also in *Emerging Order*) irrelevant.

I do not agree with Lindblom's point of view, but he is raising important and rather obvious issues, and these edited collections would be stronger had these issues been dealt with head-on, and continuously.

Third World Politics: An Introduction

Christopher Clapham

London: Croom Helm, 1985. 187pp. £6.95pb

It is scarcely surprising that the theoretical discourse associated with our comprehension of the dynamics of Third World politics has acquired the rigour and sophistication that we have witnessed over the past twenty years. Initial intellectual work on these states in the 1960s was abysmally poor: this was the age of 'modernisation theory' which projected an 'evolutionary' law of history to try to explain the underdeveloped character of these economies. The history of these states was implicitly denied, particularly the *objective* role they played in the development of global capitalism over the past 400 years. There was hardly any theoretical effort to examine the *acute* social differentiation which either existed here prior to colonisation or thereafter. In spite of this, proponents of 'modernisation' saw the role of the 'emerging elites' of these states as some benign officials consciously oriented towards developing their states from the 'drabness' of the 'traditional' society to the 'modern' (ie. industrialised/Westernised). The assumption that these elites would continue to embark on 'development' strategies that reinforced the dependence of their economies on those of the West was of course the ideological foundation on which 'modernisation' was erected. We had to wait for the historical materialist response to 'modernisation theory' to realise how fallacious most of its assumptions were.

Christopher Clapham, in this very important introduction to Third World politics, has avoided getting 'bogged-down' in assessing the contending paradigms of Third World underdevelopment. Instead, he poses the question: 'What does politics actually *do* for the people whose lives are shaped by it?' Before going on to answer in depth this question as it affects the various *forms* of the Third World state, Clapham asserts that 'Politics everywhere, in its essentials, is much the same. People do not greatly differ. They want security, wealth and the power through which to get them' (p 1). In the main,

the author feels that the record of the Third World state in offering its citizens physical security and the social opportunity to express their aspirations has been poor. One of the debilitating features of the leaderships of the state is to hold tenaciously to power, quite often as an enduring project.

What Clapham's pointed conclusion underlines, depressing as it may be, is that the struggle to confront intense social contradictions (caused by both *endogenous* and *exogenous* factors) in order to achieve justice for the people will continue to be a prominent feature in the future development of politics in the Third World.

Thinking about National Security: Defense and Foreign Policy in a Dangerous World

Harold Brown

Boulder, Colorado: Westview (Distributed in the UK by Bowker). 1983. 288pp. £14.75

When an articulate former US Secretary of Defense takes pen in hand and prepares a book about national security policy, curious laypersons and scholars are prone eagerly to anticipate the final product. Now that Harold Brown has completed his work a number of people will be disappointed with the outcome. Scholars will find little that is terribly original or provocative. No fresh insights emerge; no new information is presented; and no really novel policy options are advanced. Even those seeking an intimate memoir from an inside player on President Carter's team will find no juicy tales about policymaking or policymakers. For a man so deeply involved in the issues he explores, Brown remains remarkably aloof. His book, therefore, is neither a reservoir of keen insights nor a personal history of policymaking in the Carter years. This is not to say, however, that Brown's book is useless. Undergraduate college students enrolled in courses on United States foreign or defence policy, for example, can profit from Brown's effort.

The scope of the book is broad but shallow. Some of the topics covered in its sixteen chapters include Soviet-American relations, the strategic importance of energy resources, deterrence and strategic forces, the United States' interests in various regions of the world, and the organisation of the national defence policymaking apparatus. Brown ably reviews several of the key elements of United States policy in these areas. The examinations of military force postures, strategic planning, defence decisionmaking, and technological development are particularly strong. These short discussions will be helpful to those who seek a far-ranging survey. Professionals will in almost every case find them superficial. Furthermore, there are some glaring omissions in some sections. In an entire chapter devoted to the energy issue, for example, the major international oil companies are not mentioned at all. In the same chapter, Brown's list of cases in which control over the supply of oil has been used as a political lever does not include the use of the oil weapon by the United States against Great Britain and France during the 1956 Suez crisis.

It is regrettable that Brown chooses to devote so little time to commenting on policies

emerging in the Carter administration. For example, he only briefly describes the reasons for the decisions to proceed with the deployment of intermediate range and cruise missiles in Europe and the 'race track' basing scheme for the giant MX missile system. Brown, furthermore, does not use his book as an opportunity for candid self-criticism. His only hint of criticism of his or the Carter administration's actions is a statement that the affair in the summer of 1979 surrounding the Soviet combat brigade on Cuba may have been 'mishandled'.

In addition to spending little energy defending the Carter administration, Brown avoids a vigorous attack on his successors. His comments are largely focused upon the inadvisability of assuming that a feasible technical solution can be found to alleviate the threat of nuclear destruction. Clearly, Brown challenges the wisdom of President Reagan's zealous pursuit of either a land-based or space-based anti-ballistic missile defence system. Brown consistently demonstrates a preference for an enhanced deterrent posture rather than elaborate passive and active defence schemes as the best way to avoid a destructive nuclear exchange.

Despite these criticisms, however, the dominant impression which emerges from reading Brown's book and others is that for years American defence planners have agreed with each other much more than they have disagreed. The range of major differences has been fairly narrow. In thinking about foreign and defence policy since the end of World War II, American officials have been guided by the largely unchallenged assumptions that the United States must expand and protect its economic and strategic interests throughout the globe and that uncompromising military might is absolutely central to the attainment of these objectives. Perhaps, given the precarious condition of the world on the brink of nuclear catastrophe, those who have promulgated these views about national security should do some rethinking as well as some soul-searching.

Gender Roles in Development Projects: A Case Book

Edited by Catherine Overholt, Mary B Anderson, Kathleen Cloud and James E Austin
West Hartford, Connecticut: Kumarian Press for the Harvard Institute for International Development. 1985. 220pp. np

As the editors of this very useful collection begin their introductory chapter, 'development planning has failed to recognise fully or systematically women's contribution to the development process or, in turn, the effect of the process on them'. They provide seven actual cases of the real-life challenges of development projects (in the Dominican Republic, India, Indonesia, Kenya, Peru, and Tanzania) on credit for small-scale entrepreneurs, community development, agriculture, and irrigation. Written largely for economist, technician, and development administrator audiences, the book is ideal both for training courses addressing planners and administrators and for academic courses on development.

the author feels that the record of the Third World state in offering its citizens physical security and the social opportunity to express their aspirations has been poor. One of the debilitating features of the leaderships of the state is to hold tenaciously to power, quite often as an enduring project.

What Clapham's pointed conclusion underlines, depressing as it may be, is that the struggle to confront intense social contradictions (caused by both *endogenous* and *exogenous* factors) in order to achieve justice for the people will continue to be a prominent feature in the future development of politics in the Third World.

PAUL WATANABE

University of Massachusetts at Boston

Gender Roles in Development Projects: A Case Book

Edited by Catherine Overholt, Mary B Anderson, Kathleen Cloud and James E Austin
West Hartford, Connecticut: Kumarian Press for the Harvard Institute for International Development. 1985. 220pp. np

As the editors of this very useful collection begin their introductory chapter, 'development planning has failed to recognise fully or systematically women's contribution to the development process or, in turn, the effect of the process on them'. They provide seven actual cases of the real-life challenges of development projects (in the Dominican Republic, India, Indonesia, Kenya, Peru, and Tanzania) on credit for small-scale entrepreneurs, community development, agriculture, and irrigation. Written largely for economist, technician, and development administrator audiences, the book is ideal both for training courses addressing planners and administrators and for academic courses on development.

Each case, though written in a slightly different style by different authors, outlines a straightforward description of the country and project context and of project design and implementation; all cases contain data in appended figures and tables. The material on women is concise and unobtrusive, but it is always clear how attention to their work and needs would further project or development goals. Although many clues and questions are raised to the inquisitive reader, this Harvard-type case analysis is non-directive. It is up to instructors, group facilitators, students and/or trainees to identify problems and pose solutions. The dilemmas in each case are complex and thought-provoking. What recommendations will an interim evaluator make for a nutrition project linking credit to participants (unusual for putting credit directly into women's hands) when existing data indicate beneficiaries are mostly well-off women? How will a division bank manager answer questions about loans to women in rural enterprise, when few data were disaggregated by sex and staff seem unaware of the range of women's entrepreneurial activities? What procedures are necessary for an agricultural college which consistently over-admits male applicants and under-admits female applicants in a country where women predominate in farming? How can community development proceed in a context where the structure of gender inequality inhibits not only women's economic activities, but their very voice in the institutions designed to encourage people's participation?

Besides the cases, the editors provide an introductory chapter with an analytic framework along with three sector-based chapters on gender issues in agriculture, technology transfer, and small-scale enterprise which are solidly documented and supplemented with lots of practical charts. Those readers who seek a more directive approach to courses or training can turn to the publisher's reasonably priced case monographs on resettlement schemes, agricultural policy implementation, irrigation, agrarian reform, and male out-migration. Development training can sometimes be long-winded on theory and abstraction, but short on practice-oriented learning materials. Kumarian Press is to be commended for this valuable and practical case-study series.

KATHLEEN STAUDT

University of Texas at El Paso

Mozambique From Colonialism to Revolution, 1900-1982

Allen Isaacman and Barbara Isaacman

Boulder, Colorado: Westview, 1983. 235pp. np.

Allen and Barbara Isaacman have done an enormous amount over the years to break down the barriers of ignorance and deflate some of the myths about one of the least studied of the larger African countries, Mozambique. Allen Isaacman first produced, in 1973, a pioneering study of the Zambezi *prazo* system (1750-1902), illustrating how an initially European institution implanted following the early Portuguese incursions had become Africanised, to the extent that ironically, many of these were active in the fight to prevent 'effective' Portuguese colonisation at the end of the nineteenth century. This book helped to undermine the myth cultivated by Lisbon of a continuous five

hundred-year presence in the country. It was followed by a major study in collaboration with Barbara Isaacman on *The Tradition of Resistance in Mozambique*, which furnished evidence of a continuing historical struggle against foreign domination taking a variety of forms and on varying scales, from the social banditry of Mapondera to the major pan-ethnic Barué revolt which counted 15,000 men under arms.

From the beginning, the Isaacmans have been sympathetic and well-informed observers from within the United States of the unfolding Mozambican revolutionary process, intent upon communicating this experience in a straightforward narrative style to the uninitiated audience outside Africa. The current volume provides a readable introduction to the twentieth-century history of the country with a text well illustrated by maps, tables and photographs. Of particular interest is the chapter on popular opposition to colonial rule prior to the independence struggle building, as it does, upon the Isaacmans' earlier work.

The most difficult period for any historians to write about is always the contemporary one and particularly so in a volatile region such as Southern Africa, where much can change in a short period of time. The book was completed before the signing of the Nkomati Accord with the Republic of South Africa and the massive escalation of destabilisation engineered by South Africa both up to and following the signing of the Accord. The principal agent of destabilisation was the Mozambique National Resistance movement (MNR), founded by the Rhodesian intelligence service in 1976 and handed on to South Africa following Zimbabwe's independence in 1980. This coincided with the formation of the Southern African Development Coordination Conference (SADCC), uniting the five former front line states of Tanzania, Zambia, Botswana, Angola and Mozambique with Zimbabwe, Lesotho, Swaziland and Malawi, into a regional economic grouping committed to decrease economic dependence by mutual cooperation. As the Isaacmans point out, at a meeting in October 1980 between Dhlakama (an MNR leader) and Colonel Van Niekerk of the South African security forces, held at a military base in the Transvaal, Van Niekerk gave the order for changes in MNR operational priorities. These were to move from the centre to the south of the country, thereby discouraging Zimbabwe and Botswana from exporting their commodities through the southern Mozambican port of Maputo. The formation of SADCC with the subsequent foreign funding obtained for the rehabilitation of Mozambique's three major ports, created the opportunity for six of the seven British Commonwealth land-locked states to begin to direct their external trade away from South Africa, frequently along more economic routes.

In order to maintain its regional economic hegemony and thereby bolster its political power and chances for survival, the white minority regime was intent upon destroying the potential SADCC threat. The challenge was to the economic aspirations of all nine states, but there was no doubting which of these were to bear the heaviest costs—Mozambique and Angola, whose geographical location, offering alternative port and railway facilities, and independence of spirit with their avowed socialist development strategies, made them the obvious targets. The Isaacmans usefully examine some of these problems in a final chapter entitled 'Independent Mozambique in the wider world'. They also correctly emphasise that the Frelimo leadership in Mozambique has always been intent upon maintaining its own independence of thought and action, from Moscow or elsewhere, although as is now readily apparent, the room for manoeuvre is certainly decreasing.

In their appraisal of developments since independence, from 1975 to 1982, the authors draw upon the available statistical material, interviews with important national political actors and with people at the base, in addition to secondary and other sources. Of particular note is the emphasis they give to the situation of women, indeed, this is a characteristic of the book in its entirety and is very much to be welcomed, redressing a long-neglected but centrally important focus for scholars on Africa.

BARRY MUNSIOW

University of Liverpool

Imperialism, Colonialism and Hunger: East and Central Africa

Edited by Robert I Rotberg

Lexington, Massachusetts: Lexington Books, 1983. 270pp. np

It would not overstate the case to say that hunger and starvation in Africa is one of the great intractable issues of our time. As Rotberg observes in his Introduction, the period since independence has seen a significant decline in Africa's ability to feed itself. Throughout the continent food production has declined per head and in many states has even declined in absolute terms. The result of less food for more mouths has been catastrophic in terms of human suffering and misery. Today not one country in the region covered in this book (Zambia, Malawi, Kenya, Tanzania, Uganda) can feed itself.

If part of the aim of this collection of essays is to examine the antecedents of the current crisis in the hope of better understanding it then this book cannot be considered a great success. What one has, for the most part, is a series of rather detailed monographs, perfectly respectable as pieces of individual scholarship, which never make the connecting leap to the wider problem. Indeed, in a few cases it would seem that some general statements about the contemporary patterns of food production have been loosely tacked on the end to make the papers relevant to the conference in Nairobi which produced this book.

Two exceptions to this are the essays by Bienen and Rimmer which are also the most broadly based. Inasmuch as they have a common theme it is one of scepticism with the proposition that current problems are to be explained solely or mainly by reference to imperialism and its effects on the region. As Rimmer points out, such a belief is based on rather dubious counterfactual hypotheses concerning what economic change would have taken place in the absence of colonialism. Whilst the evidence of other chapters does support the view that colonial rulers could (and should) have done more than they did to help African food production this in itself does not undermine Rimmer's main point.

Individual chapters in this book will be of interest to historians with special concerns in the region, but it is very unlikely that it will make a wider impact. One firm comment needs to be made. At the original conference nearly half the participants (listed in the book) were Africans and yet none of the papers published here is by African. It may be an embarrassing question, but one would like to know why.

JOHN A WISEMAN

University of Newcastle-upon-Tyne

Palestine and the Palestinians 1876–1983

Pamela Ann Smith

London: Croom Helm. 1984. 279pp. £16.95

The emergence of the Palestinian resistance movement in response to the defeat of the Arab state system in the 1967 war with Israel has generated a reawakening of interest in the question of Palestine. Much of the literature of the 1970s focused on the rebirth and reaffirmation of Palestinian national identity, on the second chapter of the Arab nationalist movement and on the concept of armed struggle as a logical alternative to classical warfare. Pamela Smith discusses these issues in her history of the Palestinian people, but she goes beyond them to trace and analyse the social transformation of Palestinian society from the Ottoman period to the Israeli conquest. The crisis which, according to Eric Wolf, stimulates peasants to rise are all present in that transformation—the demographic, the ecological and the crises in power and authority. But a potential peasant revolution in Palestine was frustrated by overwhelming pressures—external and internal—which sapped national collective energies and led to social and psychological demoralisation.

The Ottoman land laws of the mid-nineteenth century made much of the communally held land a free-floating resource and contributed to the rise of private property and the concentration of wealth in the hands of landed families, resulting in an inevitable land alienation. By the 1920s and 1930s class differentiation was a visible phenomenon of Palestinian society.

Other Ottoman decrees known as the *Tanzimat* hastened the process of commercialisation of the land and urbanisation. By the end of the nineteenth century, Ottoman decline resulted in the transfer of whole sectors of economic activity to European interests. That process when Palestine was opened up to foreign trade and settlement resulted in a massive rise in the price of land, and the emergence not only of wealthy landlords but also of a new rural proletariat of landless tenants, sharecroppers and poor peasants. Zionist settlement aggravated the social cleavages by contributing to the proletarianisation of peasants and the enrichment of land speculators. The land-owning segment of the Palestinian leadership acted to ensure that the 1936 revolt did not threaten their vital interest by issuing an appeal urging that the strike be called off when the citrus crop was due to be harvested. Likewise, the urban leadership nipped in the bud a revolution in gestation by preventing the transformation of a futile non-violent struggle into an armed uprising.

Part two of the book extends the socio-economic analysis to the post-1948 period. Smith offers an original explanation of the relationship between the goal of Palestinian statehood in the West Bank and Gaza and the interests of the new bourgeoisie which made its fortune in the Gulf and in Lebanon. She also discusses the fragmentation of the Palestinian peasantry as a class, and she addresses the crucial question of how much class consciousness as such has reflected itself in the ideology of the PLO. She also shows how other factors such as place of origin, family ties, religion, age, education and the state of the Arab World have been determinants of political consciousness.

Pamela Smith's contribution to the growing literature on Palestine is important for its originality and its discussion of the question in terms of class and social transformation gives it distinction.

The book is based on extensive interviews with numerous Palestinians and it makes use of archival and other unpublished material.

NASIR H ARURI

Southeastern Massachusetts University, North Dartmouth

India and the Great Powers

Timothy George, Robert Litwak and Shahram Chubin

Aldershot, England: Gower for the International Institute for Strategic Studies, 1984. 242pp. np

This work is a part of a new series of regional security studies prepared under the auspices of the International Institute for Strategic Studies (IISS). The series reflects a recognition that regional issues, and regional perspectives about regional and world order issues, deserve attention in a pluralistic world. This recognition by an international centre of military analysis was overdue but still commendable. In the IISS's history, its analyses have been devoted mainly to East-West security questions and, even here, because the Russians are the bad boys, the Western slant unavoidable. Furthermore, Third World security questions are marginal to the security concerns of the USA and its allies in Europe, Northeast Asia and the Middle East, and they have been neglected in IISS's discourses. So it is refreshing to see the IISS dip its feet into the troubled North-South security agenda of the Indian subcontinent, the Gulf and the Indian Ocean.

This slim volume consists of three major essays by three competent observers of the scene. The book is a welcome addition to the growing literature on Southern Asian questions. The work concentrates on India's relationship with the great powers. The essay by George, a British diplomat who has served in Asia, deals with Sino-Indian relations. Litwak, a Harvard-based scholar writes on the place of the USSR in Indian security thinking. Chubin, who started his academic career under the shadow of the Shah of Iran and is now based in the Graduate Institute of International Studies, Geneva discusses the place of India in US foreign policy. All three are knowledgeable about US thinking and subcontinental developments. All the essays are informative. Chubin's essay is, in part, stylistically tedious and could have used the services of a good editor but this defect is more than adequately compensated for by the substance.

George's essay is sophisticated but not flawless. If, as he says, Sino-Indian relations have less content than Sino-Pakistan relations then why 'must [China in strategic matters] be of primary underlying importance to India.' (p 66)? He is of course, right that the margin to improve Sino-Indian relations is narrow and sensibly recommends that the West needs to be on good terms with both India and China.

Litwak stresses India's muted response to the USSR's actions in Afghanistan contrasts this with India's strong reaction to the US in Diego Garcia. Selectivity, inconsistency, is the normal practice in governmental communications and the policy depends on the internal motivations and assessments of national interests. But Litwak does not understand this; to him this reflects India's asymmetric relationship with superpowers (but its causes are not assessed) and this causes worry about the erosion

India's non-aligned status. The implication is that even though the geo-strategic realities as seen by Indian decisionmakers require asymmetry in Indian policy, India must still be even-handed because this suits the American purpose. The analysis on this point is impressionistic. India's non-alignment—especially the premises underlying that policy—was significantly eroded in 1962, and not after the Indian reaction to the Soviet intervention in Afghanistan, and the Third World's reaction to India's posture. Too much is made of outward diplomatic postures and tactics when motivations, and scope and limits of inter-state relations deserve study.

Chubin correctly notes that US interest in India was historically marginal. It was a 'sum of tactical expedients'. It oscillated between East-West and North-South regionalist concerns, but a number of new considerations, principally Afghanistan but also the link between the subcontinent and the Gulf and the nuclear issue, have increased US interest in India. Chubin's comments refer essentially to US thinking during the Carter and the Reagan administrations. There are no explanations of the origins of US policy and thinking about India. Although Afghanistan is a benchmark in Reagan's policy and to Chubin's analysis, the US interest and motivation in challenging Soviet power in Afghanistan is not explained. One is left with the uncomfortable feeling that the 'new considerations' are also temporary tactical expedients. With a new administration in Washington there may be a new agenda, and a new IISS analysis. A central question is whether there is a stable 'South Asia' constituency in the Washington area, and if so where is it?

These essays do not break new ground for academic and government practitioners but they capture the mood and they provide a picture of the complexities of subcontinental relations and great powers' interests. This by itself is a significant feat. But the gaps in the scope of the work should be noted: first, the place of India in US foreign policy is discussed but there is no systematic discussion of the place of India—and indeed of Soviet strategy towards Iran, Afghanistan and Pakistan and the Gulf region—in Soviet foreign policy. This is necessary if the asymmetrical nature and context of the Soviet and the American connections in Indian strategic thinking are to be understood; second, Soviet motivations and debates within the Soviet establishment which led to the December 1979 invasion are not discussed. There is a strange silence about the chronology and the general interplay between the domestic and the external environment which culminated in the Soviet intervention; and third, if the central concern is with Soviet expansionism then surely the benchmarks ought to be Soviet actions in Ethiopia or Angola or Mozambique or Aden rather than simply Afghanistan.

ASHOK KAPUR

University of Waterloo, Ontario

The PLO: The Rise and Fall of the Palestine Liberation Movement

Jillian Becker

London: Weidenfeld and Nicholson. 1984. 303pp. £12.50

In spite of its grandiose claims of setting history right, this book has shown Jillian Becker's deplorable lack of judgement. Even before one opens the book's cover, the very

title determines that the PLO has fallen. This, perhaps, indicates to the reader that the author is engaging in 'wishful thinking' as much as it indicates her bias. In this book, Jillian Becker sets out to show that since its inception, the PLO 'had been nothing but a savage instrument of Arab politics', and that its 'business was to keep [the Palestinians] in misery and to waste their lives, generation after generation.'

Throughout the book, the author's accounts of the Mandate period, the wars of 1948, 1967, 1973 and 1982, and the developments since the founding of the PLO take a clear anti-Palestinian and pro-Israeli line. Every war was instigated by the Palestinians and/or Arabs. Every massacre was committed by the Palestinians and/or Arabs and always against innocent Israelis and/or Westerners. Even the media, in the author's opinion, has misrepresented the 'culprits' (the Palestinians) as the 'victims'. In reading this book, one gets the feeling that there is a global (including Western) conspiracy to portray Israel as the aggressor in the Middle East! Even more outrageous is her claim that the Palestinians themselves created the Palestinian refugee problem.

Because it is impossible in this brief review to deal with every point the author raises, it may be sufficient to remind her and her readers to read the diary of Mr Joseph Weitz, former head of the Jewish Agency's Colonisation Department. In 1940, Mr Weitz wrote:

Between ourselves it must be clear that there is no room for both Arabs and Jews in this country [Palestine] . . . We shall not achieve our goal of being independent people with the Arabs . . . And there is but to transfer all of them: not one village, not one tribe should be left . . . there is no other way out.

JAMAL R NASSAR

The Prophet and Pharaoh: Muslim Extremism in Egypt

Gilles Kepel

London: Al Saqi Books. 260pp. £5.95

Egypt's liberal and secular tendencies are deeply rooted in her historical and intellectual developments. The works of contemporary writers such as Tawfiq al-Hakim, Yusif Idris and Khalid Muhammad Khalid further reveal that the critical intellectual tradition persists despite many odds. There is also the irrational and anti-intellectual tradition of Egypt, the unseemly side against which sensible people recoil with horror. The crushing poverty, the inhabited cemeteries, the crowded buses and the despair born out of subhuman existence give rise to millennial visions as well as to paroxysms of hate and violence. This aspect of Egypt has found an exportable commodity in the guise of Islamic militancy.

The critical and questioning tradition exists alongside the desperate attempts to provide all the answers to the troublesome aspects of life. They are locked together in a long and bitter struggle. To present one and ignore the other is a prescription for doing violence to one's own sense of objectivity and balance. Worse still, to see the social world through the eyes of texts or to examine behavioural traits without their causes is a sure way of either exaggerating the phenomenon or making it look absurd.

The absurdity revealed in *The Prophet and Pharaoh* is largely the result of the author's selection of texts written in the majority of cases by obscure and insignificant figures—individuals from the fringe of Egyptian society who emerged on the political scene quite suddenly only to vanish from sight leaving behind no traces of abiding value. Most of these individuals received education in anything but Islamic theology or jurisprudence, including Sayyid Quth whose work *Signposts* receives more attention than it deserves. The author goes further by quoting from literature meant for children and from leaflets intended for students. All these would have been regarded as legitimate had the author recognised the limits of such an inquiry. The fact that he did not is apparent in his extrapolation from this dubious literature to pass intemperate judgement on Egyptian society as a whole, while expressing the disappointment that the literature lacked programmatic and theoretical bases.

The absurdity is highlighted further by the literal translation of texts rather than exposing the meaning behind the words. This is a serious limitation for an author interpreting texts written in a language which easily lends itself to pun and hyperbole in order to produce the maximum effects on its audience. However, the author misses the intended meaning not only because of unfamiliarity with Arabic, but also because of lack of understanding of the objective conditions. Had he been sensitive to both, he would have found the mixing of the sacred and the profane and the substitution of the ridiculous for the sublime less confusing and hardly a cause for derision. As for example, Quth draws the distinction between *ibada* (worship) and *ubudiyya* (enslavement)—a play on words which the author misses (pp 47–8)—to distinguish the sacred from the profane and to show that political illegitimacy lies in their intermixture by the temporal authority. Kishk intended to convey the same message in his sermon whose exaggerated tone seems to have fascinated the author as evident in his rather unnecessarily long quotation.

The author is also ambivalent about the place of the Islamic militants in the Egyptian social and political orders. At times he exaggerates their power and political impact. For example, he points out that a crackdown on the militants in 1980 would have been suicidal, and that they exercised at a particular moment in history 'a remarkable power of attraction on an entire section of the dominated layers of society.' (p 232) However, he is closer to the truth when he examines the power of the state and its capacity to deal effectively with the militant challenge. As he himself points out, the Islamic groups failed 'to grasp that the Egyptian masses did not feel allegiance to the Umma in the mythical form resuscitated by the Islamicist movement, and that this population had not radically broken with the values of the Egyptian nation as such, values of which Islam is the most important, but not the sole, component.' (p 237).

The scholarly value of the book is further reduced by the absence of proper documentation and references to facts and opinions. Without these one may question the authenticity of some of the quoted texts.

Small Wars You May Have Missed

Andrew Graham-Yooll

London: Junction Books. 1983. 293pp. np

Sovereignty in Dispute: The Falklands/Malvinas, 1493–1982

Fritz L Hoffmann and Olga Mingo Hoffmann

Boulder, Colorado: Westview (Distributed in the UK by Bowker). 1984. 194pp. np

Small Wars You May Have Missed is a delightful book which can be read for entertainment as well as for instruction, but its underlying serious purpose is to present a general overview of war and foreign intervention in Latin America with special attention paid to the imperial role of the United Kingdom. As Graham-Yooll says, the British had on the whole rather tended to forget that role until the Falklands crisis of 1982 brought it home to them in the most abrupt way possible. The author, born in Argentina and now a journalist living in London, is on the whole content to present facts rather than to criticise. Only once does he engage in speculation (justly and fairly labelled as such), when he suggests that the massacre of 'native Indians' in Argentina could have been the result of pressure from Europe, in particular Britain. Since no substantial evidence is presented, the speculation seems rather unnecessary. The rest is the story, largely drawn from British newspaper sources and previously unpublished correspondence, of a century of turbulence, in which gunboat diplomacy was normal behaviour both for the Great Powers and for the small ones who asserted their new independence by following the example of their superiors. Since the reviewer enjoyed the book very much, he feels bound to add that Britain's last use of nineteenth-century gunboat diplomacy in the Western Hemisphere was not in the Venezuelan blockade of 1903, but in 1913 in order to force the Guatemalan government of Estrada Cabrera to settle the question of its national debt; an action which, incidentally, played a key role in converting the then United States government to the idea of armed intervention as a method of teaching Latin Americans 'to elect good men'.

As Graham-Yooll points out, the early history of the Falklands/Malvinas continues to be all too relevant to the current debate on their future, and it is a thousand pities that the question of their status was not settled in the nineteenth century. Since 1954 Argentina has sought to have their future treated as an issue of decolonisation, for which the question of previous status and history would, according to the United Nations General Assembly, be irrelevant. Yet ironically, to avoid the implication that decolonisation for these islands would—as it normally does for other territories—take the form of independence, Argentine spokesmen still have to use historical arguments to try to prove that they have some claim to them. A full study of the historical record by uncommitted third parties would have been, therefore, very useful to those who try to read what the record actually said.

Since *Sovereignty in Dispute* was published, Professor Fritz Hoffmann, formerly of the University of Colorado, has, sadly, died, but Mrs Hoffmann, who is Uruguayan by birth, has continued their joint work. This book is an historical study of the islands, their relations in turn with Spain, Britain and Argentina, and the role of the United States in the dispute. It deals only briefly with the Falklands War, but carries the story down to the resolution of the General Assembly of the United Nations in November 1982. It is a

well-informed book, and a British reader will find much here about the Argentine grounds for claiming the Malvinas which may come as a surprise. It is equally fair to say, unfortunately, that it is by no means a complete account, as a number of points favourable to the British side seem to have been overlooked. To take but one example, South Georgia was never Spanish territory (it lies on the Portuguese side of the line of demarcation of 1494), it was first claimed by Captain Cook, it was first occupied by Britain, and hence never has belonged to Argentina (cf p 95); the 'workers' landed there in 1982 were Argentine naval personnel (cf p 156), and Britain had a perfect right to oppose their entry. Perhaps, despite the enormous advance in historiography in recent years, no one can write the definitive history of the rival claims just yet. If so, it is not hard to explain how, after such a costly war, the Falklands themselves remain in dispute.

PETER CALVERT

University of Southampton

Latin American Nations in World Politics

Edited by Heraldo Muñoz and Joseph S Tulchin

Boulder, Colorado: Westview, 1985. 278pp. £33.50. £15.00pb.

Latin America, with so much in common in the way of language, culture and legal tradition, offers a uniquely valuable opportunity for the comparative study of international relations. International relations as a discipline, however, has been moulded primarily by the experience of the Great Powers. It is still with their foreign policies that it has most to do, and those of the Latin American states, despite more than a century and a half of experience, are most unevenly studied; indeed, we should know little that is systematic about them in any respect if it were not for the work of scholars in the United States. Yet studies of United States relations with Latin America have inevitably been of much more value in elucidating that country's policy towards individual Latin American states than Latin American states' policies towards the United States.

The present volume seeks to make a new start. Its purpose is to bring together a number of scholars to study the foreign policies of major Latin American states within a comparative context, and thus make a substantial contribution both to our knowledge of the area and to the study of international relations.

It opens with a useful survey article by Alberto van Klaveren, 'The analysis of Latin American foreign policies: theoretical perspectives'. By dating the 'first wave' of scholarly studies of Latin American foreign policies to the 1970s, he draws attention to the uneven quality of what is available, and in his later discussion he gives us some clues as to why this is the case. To begin with, primacy of place has gone to systemic studies of foreign policy which see it as the product of adverse international factors. Dependency theory, its most characteristically Latin American contribution, relates these so as to explain the failure of national development in Latin America 'in the light of the historical insertion of the region into the capitalist world system' (p 7). Secondly, as Jorge Domínguez has shown, the literature is dominated by the popular 'strategic' perspective, 'characterized by its strategic, rational, and calculating orientation, by its rational and unified state actor assumption, and by its stress on international conflict'

(p 5). Geopolitics, which whatever its standing elsewhere, is alive and kicking in Latin America (particularly, but by no means exclusively, among the military) is theoretically confused and unsound. Internal factors have been neglected as sources of foreign policy behaviour, and this stems not merely from the difficulties of identifying them, but from the dearth of detailed case studies, even on specific foreign policy issues. The bureaucratic politics perspective has never been popular with Latin Americanists, in spite of (or because of?) the obvious importance of bureaucratic structures and modes of thought in Latin America; an exception was the study of Cuban foreign policy by Edward Gonzalez.

Kenneth M Coleman approves and endorses van Klaveren's four concluding recommendations:

1. the elaboration of conceptual frameworks that would facilitate theoretically grounded studies employing multicausal explanations;
2. the use of methodologies that are more explicitly comparative;
3. the use of sectoral analyses of foreign policy or analyses distinguishing between dimensions of foreign policy action that differ from each other; and,
4. the introduction of greater clarity about what it is precisely that one purports to explain or about "which dimensions of the external behavior of Latin America" are to be examined' (p 23).

There seems to be no doubt about the significance of bureaucratic tradition in Brazilian foreign policy; it is this element above all that Alexandre de S C Barros stresses in his succinct appraisal, and it is significant that he can demonstrate a high degree of continuity in policymaking before and after 1964. In his study of 'Policy, bureaucracy and foreign policy in Chile' (Chile historically has one of the best foreign services in Latin America), Manfred Wilhelmy attributes far more significance to the president, and hence to the disjunction of policy in 1973, and more surprisingly dismisses the bureaucratic politics approach as 'an analytical tool that responds basically to the particularities of the United States and Western European reality' (p 45). Wolf Grabendorff's useful study of the role of regional powers in Central America focuses on what he terms 'the community of interests and the diversity of objectives' of the Contadora states, one of which—Venezuela—is also the subject of Anthony Maingot's study of changing perceptions of the Caribbean by three states, and John D Martz's study of the role of political parties in Venezuelan foreign policy formation. The international policy of the Chilean socialist party is the subject of Heraldo Muñoz's own contribution; he sees it as balanced midway between populism and doctrinaire socialism, while policymaking by an authoritarian regime is not only the subject of Joseph S Tulchin's study of Argentina, but also of Carlos Moneta's thoughtful appraisal of the consequences of the Falklands/Malvinas War. The latter, however, is also a study of policy before and after a disjunction, as is Monica Hirst's study of Brazil and Helan Jaworski C's study of the 1968–80 military government in Peru.

It is far to say that this book is neither as developed theoretically nor as comparative in its treatment as its editors intended. Nonetheless, it is necessary reading for anyone wanting to undertake serious study of recent Latin American foreign policy making, and a welcome addition to the literature available to those who study foreign policies of Third World states.

PETER CALVERT

University of Southampton

Development and Crisis in Brazil, 1930-1983

Luiz Bresser Pereira

Boulder, Colorado: Westview, 1984. 241pp. £11.75

Already 1985 has proved to be a critical year for Brazil. After twenty-one years of authoritarian military rule, the country is engaged upon the painful task of re-establishing representative government and attempting to create democratic institutions in the face of profound social problems engendered by economic crisis and enhanced popular expectations. For Professor Bresser Pereira, present developments spring directly from the events of 1983, notably the extensive riots which occurred in the city of São Paulo during March of that year, a few weeks after opposition governors took office in almost half of the country's twenty-two states. These massive protests against rising unemployment, the escalating cost of living and the sharp inequities that characterised Brazilian society were the most violent form of popular public action to have taken place since the military *coup* of 1964. In charting socio-economic and institutional changes since 1930, Bresser Pereira has not only coined a new phrase to describe the present situation ('mature industrialized underdevelopment') but has attempted to explain both the political significance of the revolutions of 1930 and 1964, and also to identify the shifting class composition of Brazilian society that led inexorably from those revolutions to 1983 and 1985.

Contrary to much recent revisionist writing, the author stresses the primacy of 1930 as a watershed in Brazilian development. Vargas' rise to power following the inter-war depression marked the country's transformation from an agrarian-mercantile society to a capitalist, industrial order. The institutions and political forces which coalesced during the 1930s were later responsible for rapid industrial expansion and the specific character of capitalism in Brazil. The events of 1930 signalled a rupture between an emergent industrial entrepreneur group of immigrant origin, and the coffee/merchant oligarchy. This division within the ranks of the dominant sector facilitated the construction of a pro-industry populist pact—an unstable alliance of business, policymakers and various urban groups—which was the *leitmotiv* of politics until its collapse in 1964 and which was only gradually and hesitantly reconstructed after 1978. The Brazilian historical process of the last fifty years is thus the story of attempts by two groups to secure their place in society, namely the middle classes who accomplished this task between the 1930s and 1950s and the working class whose search for an authentic representation emerged during and after the 1960s. The rapid—albeit unequal—consolidation of these classes is acutely observed from 1930 until 1961 as is the consequent contradiction manifest in social conflict between the late 1950s and 1967. From the crises of the 1960s—characterised by increasing economic instability, inflation, falling real wages of the emergent urbanised industrial workforce, social decomposition and the collapse of semi-representative political institutions—evolved an ascendant industrialism. If the immediate post-1964 administration was essentially anti-industry, an enhanced representation of manufacturing interests in the post-1968 techno-bureaucratic-military regimes ensured rapid industrial growth founded upon consumerism and a skewed pattern of income distribution. But the inevitable contradictions of this 'economic miracle' created an opportunity for the reconstitution of the populist pact, or rather a more mature manifestation of Brazil's historic compromise. Re-democratisation is a

direct, though not necessarily an anticipated, consequence of state policy which established industrialisation as its prime objective, a process that resulted in renewed bourgeois pressure for an opening of the political system after 1977 and which sustained an organised urban workforce able to articulate demands for basic institutional reform. These internal pressures, although subsequently enhanced by external shocks, were responsible for a return to democracy in 1985, a signal victory for civil society.

This plausible, if occasionally simplistic analysis of the forces which shape and continue to determine the evolution of contemporary Brazil is not entirely original, nor is it lacking in contradiction. At times the narrative is dated. Given that various sections of the book were written at different times, this is hardly unexpected. Paradoxically, these idiosyncrasies add conviction to Professor Bresser Pereira's interpretation. The translation of *Development and Crisis* into English is to be welcomed not only because the Portuguese version has run through several editions and has been well received in Brazil, but principally because the study charts the intellectual peregrinations of a respected academic, prolific economic journalist, successful businessman and, now, influential political figure. The author is not a detached observer of the process explored, but has experienced and sought to influence the course of events described. In this respect the analysis if eclectic is perceptive, socially aware and cautiously optimistic and for these reasons must be applauded.

COLIN M LEWIS

London School of Economics and Political Science

The Economy of Barbados 1946-1980

Edited by D Worrell

Bridgetown, Barbados: Central Bank of Barbados, 1982. 199pp. np

The Barbados Central Bank is to be congratulated for breaking new ground in the English-speaking Caribbean. Annual reports, quarterly economic bulletins etc, are now standard features of central banks in the Caribbean, but extended monographs on economic development issues such as the one Worrell and his colleagues of the Research Department of the Central Bank of Barbados have attempted to put together are of recent vintage. The publication owes its origins to the tenth anniversary of the Central Bank rather than to the promotion of 'knowledge for its own sake', so to speak. Nevertheless, the point is still made.

Six chapters of uneven quality make up the book and there is long-windedness in most of them. Worrell provides a descriptive survey of the Barbadian economy between 1946 and 1980 in the first chapter. The terrain is wide indeed covering growth and sectoral shifts, balance of payments, investment, finance, employment, and prices. The treatment is quite cursory what is perhaps a trade-off between width and depth. Cox follows with a look at the manufacturing sector. We are told that 'the growth of the manufacturing sector in the post-war economy was below the average growth in real output; the labour force participation rate in the sector also rose more slowly than the national average'. The impetus to growth in this sector came from exports, so that import-substitution industrialisation was a drag on the economy. Haynes, in the next

chapter, on sugar and the Barbadian economy 1947-80, indicates that the period 'witnessed a relative decline in sugar to the economy when measured in terms of output, employment, and foreign exchange.' This was partly due to attempts at economic diversification, and problems affecting the viability of domestic sugar, namely production costs on one hand, and international prices on the other. There is no discussion of how Barbados, a one-time technological leader in high-yielding varieties of cane, came to lose its technological cutting edge, and how this, among other considerations, could have affected the cost curve of its sugar. Phillips, in chapter 4, looks at the development of the tourist industry in Barbados between 1946 and 1980. He notes that the 'shift away from full service accommodation towards apartments permitted a rapid expansion in arrivals but reduced the expenditure creating potential of the industry and generated lower levels of gross expenditure'. There is no economic analysis of the macro-economic impact of tourism, and the subject of social costs of the industry lacks substance. Braithwaite and Codrington, looking at the external sector of Barbados, 1946-80, argue that export promotion must be a vital part of future development strategy. Unfortunately, there is no discussion on problems of market access to developed countries, the scope of the Caribbean Basin Initiative and the Lomé Convention in facilitating this; possible product groups with a comparative advantage suited for international competition; the role of transnational firms in production, marketing, and distribution of goods world-wide for Barbados, as well as problems likely to be associated with this. The last chapter provides a select bibliography on the Barbados economy by Williams and Payne, but this subject does not really fall into place, given the nature of the previous chapters. It can be best regarded as an Appendix.

The book provides no prior historical background of the Barbados economy as a basis for the 1946-80 discussions so that one inevitably confronts a historical void on embarking on the introductory chapter. There is hardly any discussion of burning issues such as growth and equity, problems of domestic food supply, the role of markets in the Barbados development strategy, the international economic crisis and the economy, and aspects of rural development. There is a marked absence of serious discussion on policy alternatives to problems discussed. And, with the exception of Cox's contribution, comparative analyses with similarly open economies elsewhere in the developing world, are absent. Worrell and his colleagues should nevertheless be congratulated for their attempt to bring relevant and hard-to-find data to bear on the workings of the Barbadian economy so that a better understanding of problems of development and change in a small economy is made available to social scientists.

Notes on Contributors

James Petras is Professor of Sociology at the State University of New York at Binghamton, and currently Visiting Professor at Haverford College, Pennsylvania. His recent publications include *The Crises of Capitalism and Socialism in the Late Twentieth Century* and *Class, State and Power in the Third World*. **Howard Brill** is a graduate student at the State University of New York, Binghamton.

John Ravenhill is Senior Lecturer in International Politics at the University of Sydney, Australia. He is the author of *Collective Clientelism: The Lomé Conventions and North-South Relations* (1985) and editor of *Africa in Economic Crisis* (1986).

Sylvia Vollenhoven is a journalist working for the *Sunday Times*, Cape Town, South Africa.

Robert Bianchi is Assistant Professor of Political Science at the University of Pennsylvania, and formerly taught political science and political economy at the American University in Cairo. He is the author of *Interest Groups and Political Development in Turkey* (1984).

Julio Faundez teaches Law at the University of Warwick, Coventry, and until 1973 was Research Fellow at the University of Chile. He is co-editor of *Nationalisation of Multinationals in Peripheral Economies* (1978) and consulting editor of the *UN Handbook on Namibia* (forthcoming in 1986).

Colin Hines is Director of the European Proliferation Information Unit (EPIC) and former Director of the Greenpeace Non-Proliferation 1985 Campaign. He is the co-author of *Agribusiness in Africa* (1983).

David Lowry is Research Associate to EPIC and a member of the Energy Research Group at the Open University, Milton Keynes. He is the co-editor of the six-volume conference proceedings: *Issues in the Sizewell 'B' Inquiry* (1983).

Lucille Mathurin Mair is a former UN Assistant Secretary-General and was special adviser to UNICEF on women's development. As Jamaica's Deputy Permanent Representative to the UN, she was a delegate to the 1975 UN Conference of International Women's Year, and was an official guest of the 1985 UN World Conference of the Decade for Women, Nairobi.

NOTES ON CONTRIBUTORS

Mark J Valencia is a Research Associate at the Resource Systems Institute of the East-West Center, Honolulu, Hawaii, and a former Lecturer at the Universiti Sains Malaysia, Penang, Malaysia. He is the co-editor of *Atlas for Marine Policy in Southeast Asian Seas* (1983) and *Marine Policy in Southeast Asia* (1985), and author of *Southeast Asian Seas: Oil under Troubled Waters* (1985).

Sue Rabbitt Roff has frequently testified on Asian and Pacific issues before the UN Trusteeship Council and the UN Fourth Committee on Decolonisation on behalf of the Minority Rights Group. She is the author of the Minority Rights Group report, *Micronesia: The Problem of Palau*.

Malcolm Deas is Director of the Latin American Centre, University of Oxford. He is Oxford University Lecturer in the Government and Politics of Latin America and a Fellow of St Antony's College. He is the editor of *Narraciones Historicas* by Eloy Alfaro (1983).

Cheryl Payer is the author of *The Debt Trap* (1974) and *The World Bank: A Critical Analysis* (1982).

Cosmas Desmond is a former Director of the British Section of Amnesty International.

Peter Woodward is Lecturer in Politics at the University of Reading.

Colin Henfrey is Lecturer in the Sociology of Latin America at the Institute of Latin American Studies and in the Department of Sociology, at the University of Liverpool.

Robert Mortimer is Professor of Political Science at the University of Colorado, Boulder.

J K P Watson is Reader in Education at the University of Reading School of Education.

Herbert Ekwe-Ekwe is a former Lecturer in Politics at the University of Calabar, Nigeria.

JOURNAL OF SOCIAL DEVELOPMENT IN AFRICA

Journal of International Development
1986, 10, 1-10

The journal will publish critical analysis of social development issues as they affect the poor and marginalised in society. It deals with concerns especially but not exclusively relevant to Southern Africa, and is addressed to development practitioners, social workers, planners and policy makers, academics in a variety of fields such as economics, geography, politics, sociology, psychology, social administration and to other concerned individuals.

Published twice annually, the journal seeks to enhance understanding of the social development processes that contribute to the planning and implementation of appropriate intervention strategies at different levels. Its goal is to discover how best to target relevant and successful projects to those most in need, and how to maximise popular participation, thereby creating egalitarian and productive communities.

Israeli terrorism in the West Bank and Gaza: the pariah as poacher

The West Bank and Gaza are ruled by a complex mosaic of laws; there is one law for Israeli settlers who are in illegal occupation of the land, and another for the Palestinians whose country it is. The West Bank Data Project Report, also known as the Benevenisti Report after the former Deputy Mayor of Jerusalem who headed the project, shows that outright expropriations and land use restrictions have given Israel effective control of 52 per cent of the West Bank; that is enough territory to support as many as one million settlers. The study described how Israeli policies have created a dual system largely for the benefit of the Israelis, leaving the Palestinians isolated in a 'patchwork of hostile regions, alienated and severed' from each other and creating 'two spatially segregated regions, ethnically divided, separate and unequal'. Classic apartheid.

Although this injustice has continued for almost two decades, the international community has been powerless to protect the Palestinians, even to the extent of making Israel acknowledge the applicability of the Geneva Conventions to the Occupied Territories. Israel protests loudly about its pariah status among nations but it has not accommodated adverse international opinion by allowing access to the Special Committee to Investigate Israeli Practices Affecting the Human Rights of the Population of the Occupied Territories.

In February 1985 the United Nations Commission for Human Rights condemned Israel for violating human rights in occupied Arab territories and urged the UN Security Council to impose sanctions on Israel. The United States and Britain voted against the resolution with the Western European countries abstaining. The Commission's most important statement was the reaffirmation that occupation itself constitutes a fundamental violation of the human rights of the Palestinians.

The Human Rights Commission assailed Israel's settlement policy and the confiscation and demolition of Arab property, large-scale arrests, ill-treatment of the Arab population and torture of Arab prisoners. The Commission described Israel's breaches of the 1949 Geneva Convention on the Protection of Civilians in Time of War as 'war crimes and an affront to humanity'. It also condemned the

'terrorist actions perpetrated against the Palestinian inhabitants of the Occupied Territories by Jewish gangs, led by Rabbi Meir Kahane, member of the Knesset, and the racist Rabbi Moshe Levinger, the leader of the Gush Emunim gang, and other racist Zionists.' The arming of settlers in the Occupied Territories had led to acts of violence against Arab civilians, as well as wide-scale damage to Arab property.

Israel is embarrassed by the emergence of and support for Rabbi Meir Kahane's openly racist and terrorist Kach party at a time when it is lobbying to reverse the United Nations resolution equating Zionism with racism. Kahane is not, as the Israelis would have us believe, an aberration or the lunatic fringe of Israeli politics. The settler mentality, which is basically the belief that the Occupied Territories are part of 'Greater Israel', is at the very nerve centre of Israeli politics. Likud is clearly opposed to a 'land for peace' deal but the Labour Party would not invite political unpopularity by jeopardising the settlements programme.

Kahane's own contention is 'I only say what many of you are thinking.' He believes in a 'pure Jewish state', to achieve which he advocates the expulsion of all Palestinian Arabs from the West Bank and Gaza. The Human Rights Commission was alarmed by this so-called 'Homeland' doctrine which envisaged a mono-religious Jewish state in the Occupied Territories. The policy not only denies the right to self-determination of the people of the West Bank and Gaza but is also the source of the continuing and systematic violation of human rights which they suffer.

Israel professes not to foreclose any options leading to a negotiated settlement but it has taken decisive steps to ensure that the economic, social and physical effects of its military occupation of the West Bank and Gaza are irreversible. The exponential growth of Jewish settlements and the aggressive behaviour of the settlers is proof of that. In 1947 the Jews possessed less than 10 per cent of the total land of the mandated territory of Palestine; by 1985, the Arabs had been left in possession of only 15 per cent of that land. The settlers have begun encroaching on densely-packed Arab areas to fulfil the basic doctrine of the Gush Emunim: that Jews have the right to settle, not just in open country but in the heart of Arab towns, and thus to replace their Arab inhabitants. The inevitable result was the violence and counter-violence that followed the Hebron casbah episode when seven right-wing members of the Knesset occupied a flat in Hebron in order to encourage more Jewish settlement there.

Is it realistic to expect that the Israelis will support a 'land for peace' deal? In November 1985 the Council of Jewish Settlers in Judea, Samaria and Gaza put out a statement threatening violent opposition if the government gave up occupied territory in return for a peace treaty with Jordan. The settlers threatened to carry out 'widespread underground activity' and an 'armed uprising in Judea, Samaria and Gaza' if even partial sovereignty was ceded over Jerusalem or the Golan Heights. The Settlers' Council pledged defiance of the government's restrictions on Jewish residence in Hebron and other West Bank towns. They declared that any plans for sharing security in the West Bank with Jordan or halting Jewish settlements were 'illegal' and violated 'the Law of Return, the laws annexing Jerusalem and the Golan Heights and, above all, the basic constitution which states as its objective immigration, settlement and sovereignty over the entire Land of Israel'.

It is not just the 45,000 Jews who have settled in the Occupied Territories who are concerned that they might be called upon to withdraw from some of their settlements if there was a peace arrangement with Jordan following the new Middle East peace initiative to which Israel, Jordan and the US are a party. The Israeli government knows that large-scale Jewish ownership of land will be a useful lever in any negotiations with Jordan and that is why both Likud and the Labour Party have systematically set about 'judaising' Palestinian land. The fraudulent acquisition of land has been accomplished through force and compulsion and the connivance of Israeli officials. Several ministries, including Defence, Agriculture and Housing, were implicated in such land deals in the West Bank under the Likud government. Methods commonly used were withholding water flow, using non-payment of tax as a pretext for entry, declaring land war booty, forging the signatures of Palestinian landowners and declaring land to be for military use and then turning it over to Jewish settlers. In a classified 1983 report to the Likud government, Israel's own State Comptroller said that he had found irregularities in the acquisition of 71 per cent of the West Bank lands bought by the government.

Yitzhak Shamir, the present Foreign Minister and the future Prime Minister under the coalition National Unity Government, finds it intolerable that a witch hunt should block this patriotic mission of land redemption. 'It is no simple matter,' he says, 'to buy land from the Arabs. There is terror, there are threats, and even murders. And it has to be done, sometimes by trickery'.

In July 1985 fifteen members of a Jewish underground group were

sentenced to life imprisonment and twelve others to terms ranging from four months to seven years for their part in a terrorist campaign against Palestinians in the West Bank. The charges included the 1980 attempt to assassinate three West Bank mayors in which two of them were maimed; the attack on the Islamic College in Hebron in 1983 in which three Palestinian students were killed and over thirty injured; planting bombs on civilian Arab buses in East Jerusalem in 1984; planting bombs in mosques in Hebron; and a conspiracy to blow up the Dome of the Rock mosque on the Temple Mount in Jerusalem's Old City.

The judges' reasons for giving those involved in the attacks on the Arab mayors only three-year sentences were interesting, if unconvincing. The defendants had said they did not want to create Palestinian martyrs, therefore they had to be judged guilty of an intent to maim, not to kill, and proof of the lesser intent was that they had planted light explosive charges in the mayors' cars. One of those convicted of participating in the attack walked free because his three-year sentence was suspended except for the time already served awaiting trial. An Arab could have received twenty years simply for being a member of whatever the Israelis defined as a terrorist organisation.

No sooner had the sentences been announced than the campaign for their pardon began, led by Yitzhak Shamir who later exonerated them, saying 'There's no connection, heaven forbid, between boys who erred but who are basically good, boys who've done much for the nation and, on the other hand, terrorists, enemies, murderers. We will do everything we can to get them a pardon.'

Over the past year the nature of the Palestinian-Israeli conflict has been transformed as tension in the West Bank and Gaza has escalated. Reservists have been replaced by soldiers recently returned from implementing Israel's 'iron fist' policy in Lebanon. The Palestinians they are confronting are a new, more militant generation which has seen Israel flee Lebanon in the face of attacks by determined individuals, unlike their parents who witnessed Israel defeat three Arab armies. They may have known nothing but the tyranny of occupation and the constant humiliation and harassment of roadblocks, searches and evictions, but although unequal they have discovered their own ways of combat. They understand that what the Israelis fear most is any display or manifestation of Palestinian nationalism.

Trade unionists have been subjected to particularly harsh repression because the Israelis do not rule out the possibility that representatives of

the interests of Palestinian labour might come to represent much wider workers' aspirations. Cultural groups and social welfare organisations are either banned or harassed. Soldiers even shoot down the kites of Palestinian children which appear to them to proclaim the Palestinian identity.

The Israelis have not held municipal elections in the Occupied Territories since 1976 when pro-PLO mayors were elected, contrary to their expectation that the traditional elite would win. The Israelis have tried to woo a group of Palestinians to create an alternative leadership to the Palestine Liberation Organisation but those who cooperated with them lost whatever credibility they had with their own community. The village leagues were seen by the Palestinians as a refuge for quislings and collaborators. Fahed Qawasmeh, the elected mayor of Hebron and a member of the PLO executive committee, who was assassinated in Jordan in 1984, said this in an interview shortly before his death:

What do they want moderate Palestinians to say? To thank God because we are under occupation? I don't know what the Israelis mean by 'moderate'. Does being a moderate in their eyes mean being an Israeli collaborator? This is a moderate? No. A moderate man is one who can accept what another needs while at the same time asking only for what he himself needs. For these and other reasons, it is not easy to have any Palestinian leader in the occupied territories who is speaking about trust, about justice, about the goals of the Palestinians.

Having suppressed every visible means of Palestinian identity in the West Bank and Gaza the Israelis are at a loss who to blame for the defiance and resistance they encounter daily. Is it because of the proximity of the PLO in Amman; are they still active in the camps in Lebanon; was the conspiracy hatched in Damascus, Tunis or Tripoli? The finger of blame simply comes back and points at the real perpetrator of violence: the Israeli occupation and its nemesis is that, despite the systematic way in which the Israelis have expropriated Palestinian land, demolished their homes, expelled, deported and detained Palestinian Arabs, their nation and the spirit of nationhood survives. Every unarmed Palestinian child who throws a stone at an Israeli soldier is a reminder of that failure.

Third World Prize 1985

*The Third World Prize 1985 administered by
the Third World Foundation
for social and economic studies
was awarded to
Nelson Rolihlahla Mandela and
Nomzamo Winnie Mandela*

The Prize was instituted in 1979 by the Bank of Credit and Commerce International SA, following the first South-South Symposium held in Arusha, Tanzania. The Prize, which is awarded annually, is US\$100,000, and a Medallion.

The Selection Committee is Shridath S Ramphal (Chairman), Robert K A Gardiner, Enrique V Iglesias, B K Nehru, and Azim Husain.

The Third World Prize is conferred on individuals or institutions, regardless of race, nationality, creed or sex, for outstanding contribution to Third World development, particularly in the economic, social, political or scientific fields. The Selection Committee determines priorities from time to time; but the principal qualities which the Prize aims to honour are originality, inspiration, enterprise, creativity, innovation and service to the general good of the peoples of the Third World.

*Azim Husain
Member-Secretary*

Citation

Nelson Rolihlahla Mandela is a towering leader for the people of South Africa in their struggle against apartheid. For hundreds of millions the world over who share their aspirations for a just society, he is a symbol of hope for human civilisation. His ceaseless mission for a non-racial society for all the people of South Africa is a source of inspiration alike for those who are oppressed and those beyond South Africa who share the burden of humanity for their oppression. When he was sentenced to life imprisonment he proclaimed from the dock: 'I have cherished the ideal of a democratic and free society in which all persons live together in harmony and with equal opportunities. It is an ideal which I hope to live for and to achieve. But if needs be, it is an ideal for which I am prepared to die.' Twenty-three years later, Nelson Mandela is still in prison, still dedicated to this noble ideal and still a symbol of hope-increasingly, for all the people of South Africa.

Nelson Mandela was born on 18 July 1916 in Umtata in the part of South Africa known as Transkei, now one of the so-called homelands. The first-born

son of a royal house, he was to renounce his chieftancy on his father's death. Trained as a lawyer, he was soon to join battle against the laws of an unjust society. His search for justice led him in 1944 to the African National Congress, which had been founded in 1912.

In the next two decades, he played an increasingly important role in the work of the ANC, sharing in and guiding its development at a critical stage of widening political consciousness among the oppressed people of South Africa. Active in building up the ANC's Youth League in the early years, he was later prominent in the national Day of Protest of 26 June 1950 against police violence directed at May Day demonstrators, and two years later in the Defiance Campaign against unjust laws.

In 1955—he was by then President of the ANC for the Transvaal Province—Nelson Mandela played a key part in the Congress of the People, which adopted the Freedom Charter which said that 'South Africa belongs to all who live in it, black and white'. This raised the basic question of not what amendments should be made to the law, but who makes the law. It was a clear affirmation of commitment to democracy and non-racialism, but it was a commitment which South Africa's rulers found subversive.

In March 1960, Sharpeville became a synonym for the violence of the apartheid regime, whose forces gunned down sixty-nine men, women and children peacefully protesting against South Africa's notorious pass laws. But Mandela persisted in his quest for negotiated change and in June 1961 issued his call to the Government to hold a National Convention to draw up a democratic constitution on the basis of the equality of all the people of the country, irrespective of race or colour. The Government spurned this call.

The obduracy of the regime and its increasing repression—of which Sharpeville had given such tragic evidence—and the recognition that half a century of patient petitioning followed by peaceful protest had achieved no softening in the rigours of apartheid but had brought ever greater violence in its defence led Mandela to establish *Umkonto We Siswe* or Spear of the Nation. It launched a programme of sabotage with attacks on selected government installations, marking a new level in the popular struggle against apartheid responding to the violence with which the regime seemed determined to perpetuate it.

In the repression which followed Sharpeville, the ANC was outlawed, but the persecution of Mandela by the authorities had begun earlier. A four-year trial for treason of Mandela and 155 other persons, both black and white, ended in their acquittal in 1961. Re-arrested in 1962, Mandela was sentenced to five years hard labour but was taken from his prison cell in 1963 to face yet new charges. He, and six others, were sentenced to life imprisonment.

He has been a unifying force to all those struggling for justice in South Africa. In the late 1970s, he was offered his freedom if he agreed to live in the Transkei where he was born and where he could have become token Prime

Minister. His answer was a firm refusal. This year he was equally forthright when offered his freedom on condition that he publicly renounce violence. His answer was given through his daughter to a rally in Soweto last March. 'Let him (Botha) renounce violence. Let him say he will dismantle apartheid. Let him free all who have been imprisoned, banned or exiled. I cherish my own freedom dearly but I care even more for your freedom. I cannot sell my birthright nor am I prepared to sell the birthright of the people to be free.'

Nelson Mandela is honoured wherever democracy and freedom are valued. Streets and buildings around the world have been named after him; so has a nuclear particle. Many cities have given him their freedom; numerous universities have conferred degrees on him. Since last month his statue adorns the South Bank in London.

In awarding this year's Third World Prize to Nelson Mandela, we salute him for his heroic fight against oppression based on a profound faith in the equality of human beings and in their right to be free. We honour him as a great son of Africa and of the Third World.

Throughout his years of incarceration his wife Nomzamo Winnie Mandela has kept faith with him and the cause he made his own, despite the many tribulations visited on her. To the agony of desolation and the anguish caused by her husband's sufferings has been added a vendetta against herself. She has been banned, detained and brought to trial on many occasions; for only ten months in the last twenty-three years has she been free of restrictions imposed by the regime. Following the Soweto uprising in 1976, she was banished to Brandfort to remain under constant surveillance and many restrictions on her freedom. There have been several attempts on her life; her children and her friends have suffered harassment. Her home was recently fire-bombed.

But, with remarkable courage and a resilience of spirit, she has continued to uphold the banner of freedom as her brave husband has continued to do from his prison cell. To the extent that the inhumane laws of the apartheid regime have allowed her, and often in defiance of them, she has herself championed the cause of her people as they suffered the pains of increasing repression and violence: deaths, detentions, forcible removals and dispossessions, separation from families and the other torments and indignities we have come to associate with apartheid.

Despite the heartbreak of separation from her husband, she has steadfastly supported him in his refusal to compromise the struggle for his people's freedom for the sake of his own freedom.

In the year that marks the end of the UN Decade for Women, it is appropriate that, as we honour Nelson Mandela, we also honour Winnie Mandela for her own outstanding contribution to the struggle for justice in South Africa.

The Selection Committee for the Third World Prize is proud to award this year's Prize jointly to Nelson and Winnie Mandela.

Yassir Arafat

Yassir Arafat is Chairman of the Executive Committee of the Palestine Liberation Organisation (PLO) and President of the Executive Committee of the Palestine National Liberation Movement (Al Fatah), and Commander-in-Chief of the Palestinian and Fatah armed forces.

Born in Jerusalem on 4 August 1929, Yassir Arafat was educated at Cairo University and joined the League of Palestinian Students in 1944. He became a member of its Executive Committee in 1950 and was its President from 1952-6. Working as an engineer in Egypt and Kuwait between 1956 and 1965, he was instrumental in forming the Al Fatah movement in 1956, becoming President of its Executive Committee in June 1968. In the same year he became Chairman of the PLO's Executive Committee.

Altaj Gauhar interviewed Yassir Arafat in Baghdad in November 1985.

AG: *In a world dominated by the two superpowers can the developing countries organise themselves into a vital force to establish an equitable world order?*

ARAFAT: The Third World faces a powerful combination of the forces of imperialism, colonialism, racism and Zionism. They present an awful alliance which has managed to strengthen its hold. When the military occupation of many African, Asian and Latin American countries ended with the defeat of these forces they substituted a regime of economic occupation of the Third World.

Take South Africa, where successive US administrations have consistently supported the Pretoria regime despite the growing political influence of Black Power in America. The US has more than a 20 per cent stake in the economy of South Africa. Britain has more than a 50 per cent stake and the rest is distributed among the other European countries. It is this financial interest which fortifies apartheid and results in the oppression and despair of the South Africans.

The extent of the post-colonial economic exploitation can be judged by the burden of Third World debts. The loans which Mexico, Argentina, Brazil and several African countries have

to repay unmask another face of economic colonialism. I am in full agreement with President Fidel Castro that the Third World must repudiate these debts. These loans do not represent a *bona fide* banking transaction—they amount to robbery. Unfortunately, there are differences among ourselves which are weakening our position.

I see the American administration as the leader of these forces of neo-colonialism and racism. The US provides support to the Pretoria regime and there is a great similarity between the US operations in the Middle East and in South Africa. The US created the circumstances in South Africa which forced the front-line states to sign agreements with Pretoria. Exactly the same kind of circumstances were created to conclude the Camp David Accords between Israel and Egypt. Israel and South Africa are major instruments of US strategic policy in Southern Africa and in the Middle East. The Americans are now attempting to create divisions and dissensions in Central and Latin America. But they cannot succeed. Let me tell you why. They cannot succeed because they can neither subjugate nor completely ignore the masses in the Third World. They need the masses because they need markets; they cannot subjugate them because no government, however powerful, can destroy the will of three-fourths of mankind.

AG: *But how can the masses be mobilised when in many of the developing countries they are under the control of autocratic rulers?*

ARAFAT: These dictators are only agents of international imperialism and international monopoly. They are no more than puppets. See what happened in Lebanon. We remained faithful to the people and committed ourselves to popular resistance and prolonged popular struggle. We trained the people, we armed the masses. When Israel invaded Lebanon under a plan drawn up by Alexander Haig and Ariel Sharon they thought the war would be over in two or three days. Israel had the full might of American military power behind it. What happened? The longest Arab-Israeli confrontation. They had more weapons, more sophisticated weapons, than we had. Some of these weapons were being used for the first time under American supervision for experimental purposes. But the confrontation

lasted for eighty-eight days. The earlier wars lasted three days or six days and the longest one thirteen days in 1973 but this one continued for eighty-eight days. General Rafael Eitan, the former Chief-of-Staff of the Israeli army, conceded in a book he wrote later that, considering its original objectives, the Israeli Army had been defeated by the PLO. We triumphed because of our people who had been trained and armed: every child, every woman, every man fought to the end alongside the Palestine armed forces.

Since then, our allies the Lebanese and we have continued a war of attrition in the South of Lebanon where Israel has suffered very high casualties. Their casualties in the siege of Beirut and in the war of attrition exceed by more than 200 per cent the number of soldiers they lost in the Arab-Israeli wars. It is this experience of mass mobilisation which we offer to the world as a model of liberation struggle. There is only one way to fight the combined forces of colonialism, imperialism, racism and Zionism and that is through the masses.

AG: *But the fact remains that the masses in the developing countries are disorganised and continue to be oppressed and exploited by their own rulers. The situation in the Muslim world, where they have the means and the resources to liberate, educate and mobilise the people, is most depressing.*

ARAFAT: I do not underestimate the difficulties. After the war of 1967 the Israelis invited General Beaufort to make a tour of the border areas of Syria, Jordan and Egypt occupied by the Israelis. The Israelis told him how they had succeeded in defeating the armies of three Arab countries. Beaufort commented that Israel's success was due not to its strength but to the weaknesses of its opponents. The Third World suffers from internal weaknesses and divisions, but the only way to establish real democracy is through the masses with whom there must be direct and constant communication. Our revolution is based on the belief that slaves cannot fight. We have to inspire the people with a sense of freedom and participation through democratic means so that each one of them, big or small, rich or poor, begins to take an active part in the struggle for the establishment of democracy.

AG: *How many Arab or Third World countries have the kind of democracy you are suggesting? I cannot think of more than ten.*

ARAFAT: And it is because of that situation that we have all these difficulties. You know the Koranic verse:

إِنَّ اللَّهَ لَا يُغَيِّرُ مَا بِقَوْمٍ حَتَّى يُغَيِّرُوا مَا بِأَنْفُسِهِمْ

[‘Allah will not change the condition of a nation until the people themselves resolve to change their own condition.’] How have the Palestinians been able to face this horrible ceaseless aggression and bloodshed all these years? Our strongest shield has been our commitment to democracy.

AG: *Do you think the Third World has missed the opportunity to establish a genuinely democratic order?*

ARAFAT: No. We have not missed the opportunity. We can do it at any time. If we have the determination to do it today, it can be done today. So I cannot accept that we have missed the opportunity. The opportunity is there. The power of the people is there; nobody can liquidate that power. The moment we decide to use this power the forces of social change will be instantaneously released and the whole environment will be transformed. It was through the use of the power of the people that colonial occupation was brought to an end. We now have to use that power to get rid of economic occupation and exploitation. In the new situation the old colonial powers do not have to deploy troops. All they need is the power of commercial banks to control the economies of all the developing countries.

AG: *It is often suggested that social change can come about only in stages. Do you think change will come through the revolutionary mobilisation of the masses or through gradual reforms?*

ARAFAT: Gradual reforms will only bring more obstacles, more loans, more exploitation. What has happened to the oil power of the Arabs? Now we do not even have the opportunity to use it. The price of oil will drop to the level of North Sea oil—\$18—and that will inevitably affect the development plans, budgetary policies and our standards of living in the oil-exporting countries. The cost of maintenance of the spectacular projects that were earlier established now exceeds the oil income.

AG: *A large amount of oil money was spent by the Arabs on arms. Has that helped the Palestinian cause?*

ARAFAT: Those arms have not been used at all. Each year more and

more money has to be spent to up-date the arms. Can you guess the amount of money they have spent on arms? Can you imagine the amount of money we are losing on this Iran-Iraq war? An American official was asked whether the United States wanted to end the Iran-Iraq war. He said, 'You must be mad, why should we?' There is so much money in it for the arms dealers. All the efforts of the Islamic Conference and of the Non-Aligned Movement have failed to stop this war. We were in support of the Iranians during their struggle, we supported them in every possible way. Now we have offered the Palestinian initiative to bring hostilities to an end. The Taif Summit adopted a resolution that all the Islamic states should help the Mediation Committee and the Good Relations Committee to bring about a disengagement of forces. We have suggested that a combined Islamic force should stand between Iran and Iraq so that the two sides would stop attacking each other. This is not a novel idea. During the confrontation between the Iraqis and the Kuwaitis the American forces intervened and brought the confrontation to an end. I myself worked as a mediator between them. The same thing happened in Korea where an international force stepped in to separate the Chinese from the North Koreans. They suffered heavy losses but in the end a ceasefire was established along the 38th parallel. We suggest the use of the same strategy to separate the Iraqi forces from the Iranian forces.

AG: *Your Cairo Declaration in which you condemn all external operations and all types of terrorism has been seen as a major concession because it amounts to a renunciation of the use of violence to attain political ends.*

ARAFAT: Let me clarify. You have to distinguish between violence and terrorism. We are against all forms of terrorism, individual terrorism, group terrorism, state terrorism; we are totally against all terrorist activities against innocent people. The Palestine National Council adopted a resolution on this and the Cairo Declaration re-affirms it. This resolution was accepted by the Casablanca Summit. So all we have done is to reiterate the two earlier resolutions.

AG: *What is the exact distinction between violence and terrorism in your mind?*

ARAFAT: The difference is the same as between legitimate armed

the social reality fits the policy claims and its justifications, despite evidence to the contrary.

Thirdly, we would expect them to attempt to quell opposition, seeking to de-legitimise it through techniques like 'red-baiting' or to intimidate it through domestic political surveillance and other police action.

There is evidence of each of these patterns. And taken together, the secrecy, deception and dishonesty, and efforts to quell dissent seriously challenge the post-Vietnam commitment to a more constitutional and democratic policymaking process.

Secrecy: restricting information to limit public debate

'You can't let your people know [what the government is doing]', the President explains at an October 19 press conference, 'without letting the wrong people know—those who are in opposition to what you're doing.'

The meaning of the President's remarks becomes clear on October 25, when US forces invade the island of Grenada and the American press is barred from the scene at gunpoint, forced to huddle on a nearby island, and compelled to transmit to the public only official lies and evasions. This wanton act of government censorship reveals 'a certain mind-set' among the nation's leaders. *Time* angrily observes: 'The notion that events can be shaped by their presentation, that truth should be a controlled substance.' Indeed so, but this flaunting of censorship reveals something more than a 'mind-set': it reveals a determination to habituate a free people to official news and to regarding a free press as the national enemy. 'It seems as though the reporters are always against us. They're always seeking to report something that's going to screw things up,' says Secretary of State George Shultz; 'pandering,' writes Safire on December 18, 'to the most dangerous I-Am-the-State instincts of his boss.'⁴⁶

Press censorship during the Grenada operation was a paradigmatic case of controlling access to information in order to legitimate quickly the policy and discourage reasoned opposition. While official 'misinformation' was later brought to light,⁴⁷ the Administration was able to sell its version at the time when opposition was likely to have been strongest. The Grenada incident, and efforts to keep policy secret in Central America, are part of a larger pattern. Since World War II there has been a secular trend (slowed, and in some cases reversed under the

⁴⁶ Walter Karp, 'Liberty under siege, the Reagan Administration's taste for autocracy', *Harper's*, November 1985, p 63.

⁴⁷ See for example, Stuart Taylor Jr, 'In wake of invasion, much official misinformation by US comes to light', *New York Times*, 6 November 1983

terrorists. It is only the Palestinians who are terrorists without exception. The Cairo Declaration was really meant to put an end to all this talk about the PLO encouraging acts of terrorism.

AG: *Chairman, I gather from what you say that the Americans find the PLO totally unacceptable?*

ARAFAT: Let me remind you that during Reagan's campaign for a second term he chose to attack the PLO in three of his five campaign speeches. There is a confrontation between us and the American superpower. We regard the US government as the controlling force of neo-colonialism, imperialism and racism, and we have no doubt that the US employs Israel to spearhead its strategy of domination in the Middle East. We understand that, we take that into account while making our plans, but we are not paranoid about it. We know that it is all part of the game and we know also that we will not lose our control in the area. So I am not worried. The US campaign against the PLO has been awful for the Palestinians, including those living on the West Bank and in Europe and America. It causes me deep sorrow but we are not losing our cool. We are carrying on the struggle because we know that we are not dealing with a local problem; we are dealing with a problem of global implications. We know that the victory of the Palestinians will be a turning-point for the Third World.

AG: *To what extent has the PLO been weakened and your own position as Chairman compromised since the Israeli raid on the PLO headquarters in Tunis? You have been to Jordan and to Cairo, how did you find the situation?*

ARAFAT: In Cairo the Americans are facing a situation of public resentment and anger. For the first time the American Ambassador in Egypt is *persona non grata*.

But first we must analyse what prompted the Israeli-American air raid against my private residence. It was not just another Israeli act of aggression; I have the documents and the proof that they were encouraged by the Americans in this misadventure. In many ways it was a fatal mistake because it affected Tunisia, a country friendly to the Americans. It violated the sovereignty of Egypt, another friendly country to the US. It offended Italy and embarrassed Yugoslavia, both friendly to the US.

What was the purpose of the raid? Israeli officials including General Moshe Levi said the target was Abu Amar. They thought they had finally got me and were crowing about the success of their raid. I was far away from the scene and waited for two hours to see whether the raid would be followed by some commando action. For me it was not the first time to be the target of an assassin. During the siege of Beirut I was subjected to aerial sniping on several occasions. They were using concussion bombs to destroy every building in which they thought I was residing. But we recovered from the siege and we organised ourselves and re-established the entire infrastructure of the PLO. It was this infrastructure which Alexander Haig and Ariel Sharon wanted to destroy and they thought that once we were out of Beirut the PLO would cease to exist. But the PLO survived and triumphed.

After the Israeli failure, the Syrians tried to liquidate the PLO by manipulating the dissidents against the organisation. They mounted a double siege of Tripoli: the Israelis from the sea and the Syrians from the land, but they failed to destroy the PLO. They were astonished how quickly we regained our strength and recovered our previous position.

After that they decided that the only way to finish the PLO was to exterminate Abu Amar. Three days after the air raid on Tunis it was revealed by the Israeli broadcasting station that the US government had been informed of the Israeli plan at least a week earlier. What does this mean? This means that while President Reagan was discussing the peace process with President Mubarak and King Hussein, he had already given the green light to the Israeli air force to eliminate the PLO and its Chairman. The Americans had decided that one party to the Palestinian-Jordanian Accord which was to form the basis of the peace process should be extinguished. George Shultz unmasked the whole thing when he said that the US was not particularly supportive of the Jordanian-Palestinian Accord. The US initially encouraged the negotiations under the impression that the PLO would never come to any agreement with Jordan. When we did come to an agreement with King Hussein, the US started back-tracking from the peace process.

In our meeting with Murphy we were told that the US would only accept such Palestinian representatives in the

negotiations as were members of the Palestine National Council. He was astounded when we accepted the proposition. Murphy then tried to find some Palestinians outside the PLO who could be brought into the negotiating process, but every prominent figure that he contacted inside the occupied territories told him that the PLO was the sole representative of the Palestinians.

AG: *What is the significance of the Syrian-Jordanian rapprochement. Can this rapprochement serve as a basis for Israeli-Arab negotiations?*

ARAFAT: The Reagan administration feels that such a rapprochement can provide the basis for direct negotiations under a false international umbrella. In my opinion, President Reagan is making a serious mistake, the same mistake which President Johnson made when he pushed the US government into direct involvement in Vietnam. President Reagan is pushing the American nation and the US government into direct involvement in the Israeli-Arab conflict.

AG: *How do you see the role of the Soviet Union which has some influence over Syria?*

ARAFAT: The Syrians, to speak frankly, are using the Soviet card to strengthen their links with the Americans. There is this agreement between Robert McFarlane and President Assad—I call it 'Camp McFarlane'. The main points in this agreement are that the PLO forces must not be allowed to return to Lebanon and that the people of Israel must be protected from the military opposition of the Palestinians and their allies.

AG: *What is the Middle East peace process about? Is it about the Palestinian homeland or about Lebanon or about the Gulf War—are they all part of the same problem?*

ARAFAT: Actually there is only one problem, the Palestinian problem. Everything else revolves around this problem. The Western mass media present the Middle East as a series of problems but the truth is that there is only one problem in the Middle East and that is the Palestinian problem.

AG: *Why do you feel they are presenting this problem as a number of interconnected issues?*

ARAFAT: Because they would like to divide the Arabs and to conclude bilateral solutions—that is part of the whole scheme of neo-colonialism.

AG: *How do you think this problem can be resolved?*

ARAFAT: The only way is to have an international conference. We do not trust the Americans; like the Israelis, they are a party to the conflict. We have paid a very heavy price for relying on the Americans. I have an agreement signed by Philip Habib, special envoy of the President of the United States of America at the time of my departure from Beirut. It is a solemn agreement in which the special envoy of the US President gave me a formal pledge to protect and safeguard the Palestinian refugee camps in the west of Beirut. Apart from this agreement, he gave me a guarantee that the Lebanese government would fully protect the camps. What happened to Sabra and Chatila? That is one instance. Following that, what happened in Tunis?

This American administration is totally committed to the Israeli point of view and that is why it is essential that we have an international conference which can provide international guarantees. The Americans make a big deal of the Soviet Union not having diplomatic relations with Israel, but the US does not recognise the PLO which, apart from Israel, is the only other party to the dispute.

The Palestinians have suffered a great deal already. What did they get out of the Camp David Accords save aggression? The Soviet Union recognises the rights of the Palestinians including their right to have an independent state, the European governments recognise that right and the Chinese endorse that position. Now there exists an acceptable basis for negotiations—the rights of the Palestinian people, the acceptance of the PLO as the sole representative of the Palestinians and the Jordanian–Palestinian Accord—still the Americans refuse to recognise these realities.

AG: *Do you think the Geneva conference will move towards the convening of an international conference?*

ARAFAT: We will know tomorrow or the day after. Today, I had a very important discussion with Ambassador Balyakof. We have had very constructive talks including the question of the international conference.

AG: *Do you expect anything substantive to come out of Geneva? Will they take any significant steps towards disarmament?*

ARAFAT: I think they will have to move towards disarmament. They have no other option.

AG: *Lastly, do you think you will see the Palestinian cause succeed in your lifetime?*

ARAFAT: I have no doubt. I will invite you to Jerusalem. You know, during the Beirut siege I told my friends that we were entering a dark tunnel, but I saw the war as an 'accordion war'. I spoke about the volcano and the typhoon when I was leaving Beirut. Nobody understood what I meant by the volcano and the typhoon but soon the Americans knew when they had to pay a high price in the shameful withdrawal of their navy and marines from Beirut because of the courage and unity of the Palestinians. All the American and Israeli intelligence could not discover that we had distributed more than half a million pieces of arms to the people.

It was during the siege of Beirut that I had the vision of Palestine—the minarets of Jerusalem, the domes of the mosques, the towers of the churches of Jerusalem in my eyes. The huge forces of Israel have been defeated twice during these three years: once during the siege of Beirut and then during the war of attrition.

The Israelis have one great fear, the fear of casualties. Look what is going on inside Israel today. The critical economic situation because of the war of Lebanon—the morale of the Israeli army, which has been shattered for the first time. Now we are David and they are Goliath. Now we know how to deal with them. They have a problem in the Knesset, and in the United States administration. The problem is that if the PLO accepts Resolution 242 what would happen next? They have to wait for our initiative before they can plan their response. We have the upper hand.

AG: *How do you see the role of the PLO in the Middle East?*

ARAFAT: We can shift the whole balance in this area. For this it is important that Egypt should take up its legitimate position in the Arab world.

AG: *How distant is that?*

ARAFAT: It is approaching. We are succeeding step by step.

I heard that the Palestinians in the occupied lands sent a message to Reagan and Gorbachov, reiterating that the PLO

was their sole representative. They said that there was no other option for peace except through negotiations with the PLO in order to secure the natural rights of the Palestinian people. Five thousand persons sent that message to Geneva. That is our real strength; the strength of the people. But I promise you I shall see you in Jerusalem.

Farouk Kaddoumi

Farouk Kaddoumi, as head of the Political Department of the Palestine Liberation Organisation, is the Executive Committee member responsible for Foreign Relations. He is the Secretary-General of the Palestine National Liberation Movement (Al Fatah).

He was born in 1930 in Nablus, and was educated at Cairo University, where he was a contemporary of Yassir Arafat. He moved to Kuwait with Arafat, and both were founder-members of Al Fatah.

Altaf Gauhar interviewed Farouk Kaddoumi in Baghdad in November 1985.

AG: *As one of the leaders of a liberation struggle, how do you see the world, and what is it you want to achieve?*

KADDOUMI: Two big questions. As a small nation the Palestinians want to have a suitable place on the political and geographic map of the world. This is the first thing. The second thing we are trying to achieve through our struggle is the recognition by all nations of the just rights of the Palestinian people, their right of self-determination and their right to return to their homeland and to establish an independent state in Palestine. These are the simple demands of the Palestinian people. Can we attain these objectives in a very short time? It is difficult to say because our problem is one of the most chronic problems of the world. It doesn't relate only to Israel and the Palestinians, but also to the Arabs, with the peace-loving progressive forces on one side and the Israelis and the US and those who support Israel and the strategic policies of the US on the other. Our strategy is to regain our lost land, but this we cannot achieve unless the other Arab countries unite to stand as one against the hegemony of the United States in the area.

In the meantime we have established close relations with other liberation movements in Africa, Latin America and in Asia. We are in touch with the liberation movements in South Africa, in El Salvador and in Nicaragua. We know that a liberation movement which succeeds in attaining its intermediate or final aims will help us to move forward

toward our goal. The Palestinian movement is not a movement just to regain Palestine: it is a fight between liberation and oppression, between freedom and slavery, between revolution and colonialism. The Palestinian movement is a war against oppression.

The Palestinian cause has survived two world wars and still continues to exist as a problem for the whole world. It is a problem that haunts mankind. It is the main source of tension in the world and one which threatens international peace and security. It is closely related to the imperialistic presence of the United States, a presence calculated to exploit the wealth of the nations in the area, particularly the wealth of oil-producing nations.

We know that the superpowers want to divide the world among themselves. That is why we are a part of the Non-Aligned Movement. But we do differentiate between the US and the Soviet Union; the PLO considers the Soviet Union to be a friend of the Palestinian people and we know that the American administration is hostile to the Palestinian people and their rights. For America, the main priority is the consolidation and advancement of Israel; it is a small state in the Middle East but receives, relatively speaking, more aid than any other friend of the US. The interception of an Egyptian civilian plane by the US after the *Achille Lauro* affair is a good example of the way in which the Americans treat their other friends in the region. After Camp David, the Egyptians felt that they might develop special friendly ties with the US, but the first friend of the US administration is Israel. That is what makes the Palestinian problem the most difficult problem in the world. Peace cannot be maintained in the Middle East while Israel continues its illegal occupation of our territory and its violation of our national rights.

AG: *You said that you seek to establish a suitable place on the geographical map of the world. Does this mean the fulfilment of your right of self-determination?*

KADDOUMI: Exactly.

AG: *And returning to your homeland?*

KADDOUMI: As I said, the attitude of the US is one of the major obstacles in our way to attaining our goals, but the most

important hurdle is the Israeli expansionist and aggressive policy. Since its creation in 1948, in accordance with UN Resolution 181, Israel has annexed the territory which was meant for the Palestinians to establish their own state. Later, they annexed another part of Palestine and in 1967 the rest of Palestine. The other obstacle is differences among the Arab states, because those differences have a negative effect on the cause of Palestine.

AG: *How deep and divisive are these differences within the Arab world?*

KADDOUMI: The central issue in the Arab world is the Palestinian problem. In their summit conferences the Arabs agree that the cause of Palestine is the central issue in the Arab world, but when it comes to action there is a wide diversity of interpretation of the cause. In the past every Arab state acted its own way but after the creation of the PLO all the Arabs were required to stand solidly behind the PLO to enable the Palestinian people to exercise their right of self-determination and to regain their lost homeland. But the Arabs remained divided and their differences were aggravated after the Camp David Accords. Then there are the differences in the Gulf. The Gulf States have established their own council for cooperation. The conflict between Iraq and Iran has also influenced the cause of Palestine and made it difficult for all the states to adopt a common stand. But we must not forget that we are part of the Third World. Our problems are the same as those of other developing countries. The real issue is the economic issue and how to make progress in socio-economic fields. I could also say that there is a kind of rivalry among the Arab leaders and in the absence of Egypt they find it difficult to unite. After all, Egypt is the largest Arab state and Egypt might still provide the political leadership which could unite the Arabs. But Egypt is out because of Camp David.

AG: *You think the present leadership in Egypt . . .*

KADDOUMI: No, no. Because of Camp David we have to boycott the Egyptian regime. Therefore, the problem we are facing is the differences between the Arab states. Oil could have united the Arabs and integrated them into the Third World. Some of the oil-producing countries should still distribute a

portion of their oil revenue to other poor countries not as charity or aid but as a national responsibility—an Arab national responsibility on behalf of the oil-producing countries. Unfortunately, during the years of oil surplus revenues, all kinds of contradictions within Arab society reasserted themselves—religious contradictions and sectarian contradictions, as happened in Lebanon. This is not entirely because of the Arabs—we know that foreign hands were involved in stirring up Arab society—but because of these issues the Arabs cannot, for the time being, consolidate their efforts to provide a united response to the new challenges.

AG: *Do you think the present rapprochement between Jordan and Syria might have a negative effect on the Palestinian struggle?*

KADDOUMI: No. We did our best to establish the reconciliation committees at the Casablanca summit with the precise purpose of resolving differences and problems among the Arab states. We want to mend the fences between the conflicting states. One of the reconciliation committees is handling the situation between Jordan and Syria. Yes, we have differences with the Syrians but if the Jordanians and the Syrians come together it would have a positive effect on our struggle. These two Arab states have to come to a compromise. Such a compromise might affect some of the neighbouring countries. We may then have to move forward another compromise between the Iraqis and the Syrians. Such a compromise would end the conflict between Iraq and Iran, would stop providing support to the Iranian regime and exercise some pressure on the Iraqis to settle their differences with the Iranians. This would have to be done in conjunction with the other states, whether they are Gulf States or in the eastern part of the Arab world.

AG: *But a Syrian-Jordanian rapprochement could weaken the position of the PLO and Chairman Yassir Arafat and deprive him of a meaningful role in the peace process?*

KADDOUMI: We are not afraid of that because we are strong enough to preserve our own position. They can go on with their negotiations to resolve the Middle East crisis, but without

the Palestinians those negotiations will serve no purpose. There will be no peace until the Palestinians regain their national rights. King Hussein knows that very well and he also knows that he cannot go ahead with the process of peace to the exclusion of the PLO. But he expects the PLO to give more concessions which we cannot do.

AG: *What kind of concessions?*

KADDOUMI: Concessions which would require us to recognise Resolution 242, the right of Israel to exist, and we cannot do that without getting something in return. Such concessions would weaken the PLO and lose us the confidence of our people. It would also widen the divisions between the Palestinian factions.

All we have agreed with other Arabs is that the Fez plan must form the basis for any future solution of the Middle East problem. We have never opposed the process of peace. It is the United States and Israel who oppose peace in the region. We arrived at an agreement with Jordan to advance the peace process. It was the Syrians who opposed our agreement with Jordan. But we have to keep up the momentum. I agree that these differences between Syria and the Palestinians have unfortunately weakened the Arab cause.

AG: *Are you being briefed by Jordan and Syria about their negotiations?*

KADDOUMI: We are being briefed by the Jordanians while the Syrians may be briefing the Palestinian factions in Damascus. But we should be very clear that the summit conference in 1974 unanimously adopted a resolution recognising the PLO as the sole representative of the Palestinian people, and we will oppose any Arab action which violates that resolution in any way. Unfortunately, some of the Arab leaders fear that the recognition of the PLO as the sole representative organisation of the Palestinians could affect their own position. The PLO, by making the Palestinian problem the central issue of the region, might steal the show from them. As I said before, every Arab state, especially in the East, was handling the Palestinians in its own way. This is no longer possible because of the PLO. The Syrians like to pretend that Palestine is different from the people of

Palestine, from the PLO; this is a deviation from the Rabat resolution. But the people of Syria, like the people of Jordan, all support the PLO. That is what makes some of the Arab leaders treat the PLO leadership as a rival leadership in the area. This is the problem.

AG: *You said that you distinguished between the two superpowers and the distinction lies in the way you see the US supporting Israel and using it as an instrument of its own foreign policy. You regard the Soviet Union as a friend. What particular acts of friendship has the Soviet Union performed in your support and what role do you expect it to play in the peace process?*

KADDUUMI: Well, first of all the Soviet Union recognises the PLO as the sole representative of the Palestinian people. The Soviet Union firmly believes that peace cannot be established in the Middle East unless the Palestinians regain their lost rights; this means self-determination and the establishment of an independent Palestinian state. They support us at all levels and in the international arena. The Soviet Union and the socialist countries support our position in all conferences and in the United Nations. In addition, we receive material help from the socialist countries and from the Soviet Union and from China. The socialist countries provide us with arms either through the Arab states or directly. We know that this help from the socialist countries does not mean that we can get all that we want.

There are differences too. The USSR recognises UN Security Council Resolution 242; we don't recognise 242. At the same time, we cannot go to the negotiating table within the framework of the United Nations without the Soviet Union. Why? Because we do not trust the United States of America. It is in the interest of the US to strengthen Israel militarily and economically in the area. It is in the interest of the Soviet Union to have a friendly Palestinian state in the area. That does not mean we are becoming communists. The USSR supported the creation of Israel and endorsed the Partition Plan in 1947. Let us not forget that today they are committed to the partition plan.

AG: *What is the Soviet understanding of the frontiers of the state of Palestine?*

KADDOUMI: This has not been discussed by them. But they support UN Resolution 181 (the Partition Plan) and insist that it should be observed by all nations.

AG: *Do you think the Palestinians made a mistake in rejecting the Partition Plan?*

KADDOUMI: We did not have the PLO at the time. The Palestinians were dispersed all over the place. But the rejection of the Partition Plan did not mean that we had rejected and abandoned our rights. The territory that was designated for us did not cease to be our territory. Palestine is for the Palestinians, and recovering our territory is only a matter of time. If the Israelis want to live in peace we think the most suitable way would be for the Palestinians and Israelis to live in one state and that will erase the sense of hostility between the two peoples.

AG: *What was the exact purpose of Yassir Arafat's statement in Cairo opposing all acts of violence outside occupied territories?*

KADDOUMI: This statement was in accordance with a resolution adopted in the summit conference by the national council in 1974. It required that all factions of the PLO should abide by the instructions of the leadership and stop committing acts outside occupied territories.

AG: *Acts of violence?*

KADDOUMI: Yes, but this does not mean that we will not retaliate. If they raid Tunis and destroy the PLO offices there we *have* to retaliate. This would be legitimate self-defence. When they make a move, we will have to respond. Second, we will continue our operations in old Palestine. Please underline Palestine and exclude what is so-called Israel. We will never stop our operations in old Palestine. Why? Because we know that Israel is not looking for peace. Israel wants to expand and to dominate the whole area, preserving it as a sphere of influence for the US. Therefore, we have no choice but to fight. The United Nations resolutions give us this right to self-defence.

Why don't we recognise Israel? I have two questions to ask first. Which Israel do you want me to recognise? First, Israel has not delineated its borders officially and is embarked on an expansionist course. Second, how can an

oppressed person recognise his oppressor? Aggression and oppression must be vacated before you could ask me to recognise Israel. That is the reason why we criticise the Western media when they ask why we don't recognise Israel. Israel is in occupation of our territory and they want me to recognise it. I will never do that. Never. When they withdraw from all the occupied territories this question might be asked. Before that it is a hypothetical proposition unless we are expected to give up all our rights.

AG: *How do you justify the acts of violence and terrorism which are attributed to the PLO?*

KADDOUMI: First, there is a difference between terrorism and violence. We have to resort to violence against an enemy who occupies our land. Israel wants to annihilate the Palestinian people, not just the PLO. The main aim of Sharon and Begin when they occupied Lebanon was to destroy the infrastructure of the PLO, that is, the masses. The massacre in Sabra and Chatila was but a manifestation of that. How do you expect me to forget all that?

AG: *Was the PLO involved in the Achille Lauro affair?*

KADDOUMI: When I have been asked about the *Achille Lauro*, I have said that the people of Palestine are distributed all over the world, forced out of their homeland. They want to find a place where they can stand and talk to the world. They found a friendly ship—an Italian ship—and they stood there to tell the world and the United Nations that 165 of the companions and brothers had been killed in the Israeli raid on Tunis. What they did was wrong, I agree. But look at the crimes committed by Israel. I don't understand why an elderly man of 69 years who had had two heart attacks and was paralysed should have been killed by the hijackers. If they want to kill there were so many others—why an old man? Now we were asked to rescue the ship and save the lives of 400 people—and we did. What was the answer? The interception of the Egyptian civilian plane by the United States. I know the US is a superpower but after the hijacking of the Egyptian plane they should stop talking about human rights. Not too long ago the US occupied Grenada, a small peaceful island in the Caribbean. That was, and is, a ridiculous thing to do. Does this mean that a

superpower has the right to do whatever it wants and that because we are small and weak nations we have no right to live in peace or to express ourselves to the world?

AG: *To what extent has this affair compromised your position?*

KADDOUMI: In 1976 we were asked to protect the departure of 2,000 American civilians from Beirut; we did. We secured the release of thirteen American hostages from Iran during the Carter administration. The Americans had given us a pledge not to let the Israelis enter Beirut. They entered Beirut and committed the vilest crimes against the civilians in Sabra and Chatila.

The *Achille Lauro* is being used to defame the Palestinian people and the PLO. The mass media talked about the *Achille Lauro* day and night, having forgotten the 165 casualties sustained by the Palestinians and the Tunisians during the Israeli air raid. Even the Europeans have been influenced by this propaganda which is wholly unjustified. But I admired that courageous man, Bettino Craxi, when he said that the Palestinian people had the right to fight for their objectives. And when the European Parliament deplored the interception of the plane, we felt that at least there were some people who had the courage to tell the truth. But there are others who hate the Palestinian people and who carry on this propaganda campaign against them.

AG: *When Chairman Yassir Arafat went to Jordan recently we had the impression that he was going to be reprimanded by King Hussein. How much pressure was put on him by King Hussein?*

KADDOUMI: You know that King Hussein made a statement in London in which he blamed Mohammad Milhem, one of the PLO executive committee members, for not signing the statement which the British Foreign Secretary wanted to have before meeting the PLO representatives. Unfortunately, King Hussein's statement was false.

AG: *Why did he make such a false statement?*

KADDOUMI: I am sorry to say we have no knowledge on that. If we had wanted to make the kind of statement the British wanted we would have gone to the US, not to Britain, to offer that statement. At least, we would have got something in return

for that. But that is one thing. But when King Hussein realised that what he had said in London was not true, he changed his mind. He realised that we had the backing of Egypt and other Arab states and that made him reconsider his earlier statement.

The British representative in the UN Security Council said that some progress had been made in the Middle East as a result of the agreement between King Hussein and Yassir Arafat, and, in order to push this forward, the British Prime Minister, Mrs Thatcher, announced on 20 September that Sir Geoffrey Howe would have a meeting with two respected members of the executive committee of the PLO. Nothing more was said by the British representative and no preconditions were stipulated for the meeting. Therefore, all the British statements are completely false. I am sorry to say that they are big liars. I never thought that a meeting would take place and that is why I opposed the whole idea. Nor do I think that the agreement between the PLO and Jordan will lead to anything. We have the Fez plan and that is the one we should pursue.

The meeting with the British Foreign Secretary did not materialise because Mr Reagan called Mrs Thatcher and told her that the time was not suitable for such a meeting. Unfortunately, King Hussein decided to support his British friends.

AG: *Is King Hussein an independent actor in this whole drama?*

KADDOUMI: When King Hussein visited the US he was offered US\$2 billion to issue a joint statement with Israel agreeing to direct negotiations. He rejected the offer. He then returned to the idea of an international conference, but the US did not agree to that. The Americans proposed an international conference excluding the Soviet Union but including some European states. The Palestinians would be allowed to participate in the conference. The whole thing was a non-starter. The only aim of the US is to split the Palestinian leadership and then present certain issues acceptable to some of the Palestinians and unacceptable to the others. But we remained flexible so that the Palestinian cause was not harmed. We wanted to demonstrate to the

so-called moderate Arab states that the Americans and the Israelis were not looking for peace but were interested only in dividing the Arabs and in creating misunderstanding between the Palestinians and the Arabs. After we presented the names for the joint delegation, the Americans said we must first accept Resolution 242. I have to refer to an historical event, the protocols of Lausanne of 1949. The Arabs accepted the protocols of Lausanne which recognised the establishment of Israel, gave the Palestinians the right to establish their own state, and allowed the refugees to return to their homeland. The US, France and Turkey were represented on the reconciliation committee. These protocols were presented to the UN: Israel became a state and was recognised by the UN, and the Palestinian state was not established and our refugees remain as refugees. How can you trust the American administration? We have shown the world that the Americans and the Israelis are not for peace. They are for the exclusion of the PLO, for the destruction of the PLO. They have tried to destroy the PLO by arms and they failed. They tried to kill the PLO leadership in 1982 and failed. Mr Begin became depressed and retired and 400,000 people marched down the streets in Tel Aviv saying 'No war! Withdraw from Lebanon!' That was the first political and psychological defeat for Israel. I said in the UN Security Council that we will remain as an iron wall around Israel and we will never allow Israel to penetrate this wall.

AG: *What is the position of the present Egyptian regime?*

KADDOUMI: The *Achille Lauro* very badly damaged President Mubarak and aroused the anger of the Egyptians. Some of the high officials who were propagating friendship with the US were shocked, and are now advocating that Egypt should be a non-aligned country and not rely on the friendship of the US. Mubarak himself was shocked and that is why he said that he had not even read the message which President Reagan had sent to him and demanded an apology. And he should. I think there is a change. This psychological shock to the masses and to the regime needed some action on our part and we did play our part. It was the time for General

Haddad to visit Egypt to build confidence between us and the Egyptians.

AG: *Have you succeeded in that?*

KADDOUME: I think that we have been successful to a great extent. Egypt supports the right of the PLO to participate in the peace process as the sole representative of the Palestinian people. Egypt also supports the idea of an international conference and is exercising pressure on King Hussein not to move forward in a manner which might hurt the PLO cause.

AG: *You would be much happier with Egypt playing a more active role in the Middle East?*

KADDOUME: We are the catalyst in the area. We know the limitations of the Arab states. King Hussein knows better than anyone else that more than half of his people are Palestinians.

AG: *Does the Jordanian-Syrian rapprochement have the support of the Soviet Union?*

KADDOUME: I don't think so. It is necessary for the peace process to have the Jordanians, Syrians and Palestinians come together. Egypt has no interest in putting pressure on the Palestinians. The Egyptian regime wants the Palestinians to be on good terms with Egypt, for this would open the way for them to return to the Arab fold. This would satisfy the people in Egypt and remove their present anger and frustration.

AG: *Are you planning to leave Tunis and settle down in Baghdad?*

KADDOUME: I don't think so. The Israeli raid did not hurt our position or status in Tunis. It certainly hurt the feelings of the Tunisians. It also offended President Mitterrand because France and Tunisia are on friendly terms; that is why President Mitterrand did not go to the summit meeting of Western leaders in Washington.

AG: *How do you view the Iran-Iraq war?*

KADDOUME: This war makes no sense. Why are they fighting and for what purpose? Do they just want to destroy each other? I was a member of the Non-Aligned goodwill mission visited Tehran and Baghdad with the other members try to find a way to cool off this war, and to establish cease-fire. But unfortunately, we failed. The Iranians h

their demand to de-throne the President of Iraq and wanted us to condemn the aggression committed by the Iraqis. They were imposing terms as if they had defeated Iraq, which was not the case. The Islamic goodwill mission has also not succeeded because of the obstinacy of the Iranians. I don't blame the Iranian people. It is the Iranian leadership which must take the decision to stop this war. The battlefield is frozen at present, there are no major operations on the ground. We are doing our best to establish peace between the two countries because the war only serves the interest of Israel. The US too wants this war to continue. The Soviet Union does not want this war because it could trigger off other conflicts in the neighbouring countries of the USSR.

AG: *Is there a realisation among the Iraqis that they were guilty of aggression in the beginning?*

KADDOUMI: There is an old story. A boy was drowning and a man came to rescue him and he started blaming the boy for getting into the water at the wrong time. The boy shrieked 'Please save me first. You can reprimand me later.'

The Iraqis withdrew once or twice during 1982 and they indicated that they were ready to accept the 1975 agreement. They want to stop this war because they see Israel occupying Lebanon. They want the Arabs to unite to fight Zionism and Israeli forces. But there is no response from the Iranians. We have to realise that this war will destroy us all and we must stop it.

AG: *Does Yassir Arafat have an influence with the Iranian leadership?*

KADDOUMI: Yes. He continuously sends messages to them.

AG: *What has been the role of Syria in this war?*

KADDOUMI: Unfortunately, Syria has played a very dangerous role. We did not want the Syrians to stand by the Iraqis. We expected them to be neutral, not to support either party and to do their best to stop the war. But they cut the pipeline from Iraq through Syria and provided the Iranians with arms and ammunition. It is not in the interests of the Iranians to continue this war. Iran is being destroyed, its economy is deteriorating, the universities are closed and the people are

frustrated. All those who are providing arms to Iran expect Iran to destroy one of the largest and strongest Arab Islamic states.

AG: *But supposing no arms were supplied and Iran was defeated would that be beneficial for the Muslim world?*

KADDOUME: I don't want Muslims fighting Muslims. They should live in peace as good neighbours. Even if one side is defeated we will have to build confidence between the Iraqis and the Iranians. The Iranians are committed to fight against Zionism. I am not prejudiced against the Iranians. I want them to be strong, but they should be on good terms with the Arabs. It is also very necessary to see that Iraq remains a strong country militarily and economically and the two should cooperate with each other.

The IMF, austerity and the state in Latin America

IMF interventions during the past ten years have attracted considerable attention from critics on both the left and right. These criticisms have tended to focus on the perceived harshness or softness of the adjustment process forced on countries facing a balance-of-payments crisis. The debate over IMF policies has typically centred on the alleged merits or deficiencies of monetarist versus structuralist analyses of the balance-of-payments problem in developing countries. While this debate is important, it has resulted in a neglect of other issues.

Regardless of the severity of the adjustment process, or its success or failure, the implementation of IMF-sponsored policies has reshaped the economic and social relationships within national economies and between the local and world economy. IMF intervention and accompanying incentives and constraints have altered the economic behaviour of social actors in favour of local and international finance capital at the expense of local productive classes.

As an integral part of Western capitalism the IMF has contributed toward restructuring Third World economies, opening them to exports and flows of capital in periods of world expansion; extraction and transfer of surplus from the Third World to the West in times of debt crisis; and enforcement of economic obligations in times of declining income and world-wide economic contraction. The IMF does not act independently, nor does its symbolic representation as an international body signify that it is anything less than a political economic instrument for Western capital. The IMF is a significant actor but its effectiveness is based on the economic interests it represents and its capacity to fashion a policy which effectively defends those interests. Hence it is important neither to exaggerate or underestimate the specific role of the IMF. It is neither an omnipotent force nor a technical agency; its power is anchored in the changing relations of power between capitalist countries, the internal divisions of capital, as well as evolving North-South relations. The global repercussions of IMF intervention—implicit in its wide-ranging role as regulator and enforcer of global economic

relations—have in turn provoked global resistance. These reactions have sometimes led to rejection and modification of IMF policies (and subsequently weakened its effectiveness in its various roles) and sometimes engendered the worst effects that those policies sought to ameliorate (deepening debt, chronic balance-of-payments problems, hyper-inflation, etc.).

It is our contention that IMF intervention and efforts to regulate capitalist development have not eliminated or ameliorated economic instability and depression but transferred it from one set of actors to another from the North to the South, from bankers to producers, from capital to the popular classes. What is called stabilisation by the IMF, the bankers and the business press, is destabilisation to the economies of the South (through transfer of surplus), to the lives of workers (through unemployment and decline in income) and to local capital (through credit squeezes and resulting bankruptcies). The particular tunnel vision that accompanies the discussion of IMF stabilisation leaves out everyone who is not part of the narrow social base that promotes and benefits from IMF policies. If stabilisation is put into a broader context it is clear that the purpose of IMF policy is *not* stabilisation of 'the economy' but the regulation of a particular set of economic relations and the consolidation of a particular set of financial interests. It is these interests that establish the parameters of IMF policy, and define its ideology; it is the pursuit of these interests that frequently leads to the unbridgeable gap between IMF stabilisation rhetoric and the generalised instability that these same policies provoke.

As a source of liquidity the IMF plays an important institutional role in the reproduction of the international circulation of capital and commodities. During periods of crisis the ability to reproduce international circulation becomes especially severe since states tend to erect barriers to the movement of commodities and capital. In addition, the concentration and centralisation of international capital in transnational banks tends to amplify liquidity crises and has increased the threat of substantial systemic disintegration. In recent years IMF interventions have been directed at buffering and regulating massive movements of capital, especially those associated with the oil shocks and the debt crises of some Third World states. One component of IMF regulation has resulted in the alteration of the structures through which the costs of economic instability are allocated among social classes and between states.

The intensity and direction of IMF interventions are limited and mediated by local class and state structures. During periods of crisis states have few options; usually the alternatives to IMF intervention are either cessation of foreign trade or a severe contraction of demand to relieve pressure on foreign reserves. The threat of forced autarchy gives the IMF considerable leverage over states with declining reserves of exchangeable foreign currencies. But this leverage is limited; the particular model of accumulation operating in a country, the capacities of a state to design and implement autonomous policies, the duration and frequency of balance-of-payment crises, class alliances and cleavages, and the state's means of regulating class conflict affect the ability of the IMF to restructure relationships. Since it is the local state which must implement any IMF-inspired policy its capacities and the particular class interests which shape it are of particular importance.

The implementation of IMF policies alters class alliances and frequently results in declining income which strains the local reproduction of capitalist relations. Strikes, riots and mass movements are frequently results of the adjustment process and occasionally lead to changes in regimes. Paradoxically, there are few, if any, instances of social revolutionary changes. Since the effects of IMF policies strike across class lines they have tended to produce cycles of authoritarian and populist regimes based on multi-class movements usually hegemonised by local business or middle-class groups.

In order to focus on the current impact of the IMF in Latin America it is necessary to review the history of IMF involvement with Western capital and subsequently its relationships with the Third World and the changing nature of IMF policies. We will then develop a typology of IMF-state relationships and explore the theoretical implications of that typology. The impact of contemporary policies will be examined in terms of changes in economic relations and social conflict. Finally, we will outline a course of future investigation.

The IMF: its changing role and policies from the 1950s to the 1970s

The IMF shifted from being primarily a European-oriented to a global agency with the growth of international capitalism. Accompanying its geographical expansion was the widening scope of its field of policy activity: from being a promoter of trade liberalisation it became an active regulator of multiple types of capital between regions of the

world economy. While the IMF was developing its own agenda, its effectiveness in realising its policies was based on the parallel development of converging economic interests within Latin America: the growth of export-oriented national-state and private capital and the establishment of multinational subsidiaries. This convergence of IMF and local capital in the 1960s was part of the process of the internationalisation of capital, a process that was resisted in particular sub-sets of countries, particularly where popular movements and regimes were ascendant.

The relative importance of the IMF has waxed and waned depending on the relative dynamics of other capitalist institutions, the degree of popular mobilisation and the overall strength of the international backers of the IMF. In summary, the factors shaping the role of the IMF in Latin America include: the stage in the growth of world capitalism; the increasing demands of multiple forms of capital expansion; the existence of collaborating groups with convergent interests within Latin America; and the overall expansion and contraction of the world economy. As we will argue below, the IMF's role has become global and central with the internationalisation of capital and during a period of *deepening crisis of world capitalism*. The specificities of historical time and economic conjuncture are crucial to an understanding of the central role that the IMF has come to play in certain Latin American economies.

The IMF was founded as part of the package of institutions and agreements that emerged from the Bretton Woods Conference. During the late 1940s and early 1950s IMF activity was largely confined to Western Europe.¹ During this period IMF activity in the Third World was limited to educational and advisory missions although membership in the Fund restricted state activities which would interfere with movements of international payments.² During the late 1950s and 1960s the IMF took a more activist role toward Third World countries through increased credit drawings under conditionality.³ IMF interventionism linked monetary stabilisation with development, and the development of financial schemes specifically designed to aid 'primary-product-

exporting countries', in particular the Compensatory Financing Facility and the Buffer Stock Financing Facility.⁴

The policy formula of the IMF during the 1950s and 1960s was limited to the liberalisation of trading relationships.⁵ The 'opening-up' of Third World countries involved the reduction of barriers to commodities and foreign capital. But the implementation of this formula by Latin American countries was not uniform.⁶ The populist regime of Brazil resisted the implementation of these policies until it was overthrown by the military and replaced by an authoritarian regime. In addition, the form of foreign capital flows varied: Uruguay and Chile favoured finance capital while Brazil, Mexico, and Argentina 'encouraged' direct investment. Lichtensztejn argues that the implementation of trade liberalisation represented not so much an 'imposition' but an 'implantation' that resulted from the 'convergence' of local and international capitalist interests.⁷

The case of Brazil is particularly interesting. During the 1960s, drawings on the Fund were fairly limited.⁸ IMF stand-by agreements served mainly as a 'seal of approval' for other forms of financial flows and for private investment. Despite the limited role of the IMF, an extremely severe wage policy was implemented by the military regime as part of Brazil's stabilisation programme.⁹ For Brazil the IMF served not so much as an initiator as a facilitator of policy.

In the late 1960s and early 1970s the IMF's influence in Latin America declined.¹⁰ During this period the Bretton Woods international monetary system collapsed as a result of the weakness of the US economy which was strained by commitments in Vietnam. In Latin America increased labour unrest led to the establishment of populist regimes or modifications of existing policies towards redistributive goals. The growth of the transnational banking system and the exponential growth of international trade during this period provided alternative sources of finance for regimes embarking on growth-oriented macro-economic policies.

The growth of international trade set the stage for the debt and balance-of-payments crisis that began in 1973-4 and which has continued with only brief respites to the present. The scale, integration, and concentration of capital and commodity flows has resulted in a system which is extraordinarily sensitive to minor failures in liquidity. For example, in recent months the failure of a small savings and loan bank in Ohio resulted in a run on the dollar in foreign exchange markets. In the late 1970s spiralling interest rates led to massive transfers from Third World to Western bankers. The decline in commodity prices relative to capital imports, the restrictions on trade, the increasing cost of invisible payments, the export of dollars to Europe by local capital, investment in non-productive activities and luxuries by the middle classes all contributed to declining productive capacity relative to the growing size of the debt. The oil shocks of 1973-4 and 1979-80 resulted in a massive transfer of value from oil importers to oil exporters. All of these factors posed a major balance-of-payments problem for many Third World countries.¹¹ During the second oil shock the over-extended international financial markets suffered a loss of confidence and this resulted in a cutback in the flow of capital to Third World countries. The number of 'multilateral debt renegotiations' per year rose from two countries in 1975-6 to eight countries in 1981.¹² The combination of these factors, and the inability of regimes to reduce internal demand provided the circumstances in which the IMF could play an enlarged role in regulating capitalist relations. Between 1979 and 1981 IMF high-conditionality lending 'surged'.¹³ After 1981, IMF lending was reduced 'perversely' at the onset of a major world recession.¹⁴ IMF lending was so sharply curtailed that net new commitments were negative.¹⁵ Williamson suggests that the arrival of the Reagan administration played a role in reduced IMF lending and that this regime was 'markedly less supportive of a major role for the Fund' than the Carter administration.¹⁶

In the autumn of 1985 the Reagan administration proposed new

¹¹ The 'terms of trade of non-oil ldes deteriorated by 15%', between 1974 and 1982 according to T. Killick *et al.*, *The Quest for Economic Stabilisation. The IMF and the Third World*, London Heinemann, 1984, p. 2.

policies which, if adopted, would re-expand the role of the IMF. This shift appears to be a response to the chronic debt crisis of Third World countries and the failure of previous US administration policy to resolve the crisis and its consequences. The new plan recommends both the expansion of IMF lending and the extension of IMF conditionality to the lending of other organisations. The extension of IMF conditionality to other organisations increases the leverage and control of the IMF over policies of recipient countries by limiting their access to alternative resources. The control of alternative resources strengthens the IMF's enforcement capabilities during a period when serious doubts are being raised about the adequacy of austerity. The expansion of lending facilities and strengthening of enforcement increases the likelihood that debts will be repaid and improves the environment (ie lowers the risk) for private lending. The debt crisis has resulted in a reduction in trade between the US and Latin America. The collapse of exports to Latin America from the US from between 1981 and 1983 accounts for 'about 50 per cent of the trade balance deterioration in that time.'¹⁷ Renewed trade requires a re-expansion of private lending, which is possible only when international bankers are assured that debts can or will be repaid.

IMF agreements: preconditions, performance criteria and stabilisation programmes

The main lever through which IMF regulation of national economies takes place is its agreements with recipient countries. It is precisely through the credit mechanism and the conditions which are tied to them that the IMF has been able to enforce the restructuring of the internal relations of production and the flows of capital between the Northern banks and Latin American economies. It is crucial to note however that IMF leverage is not at all times the same: maximum leverage is exhibited in those cases where countries have exhausted their easy credit terms and have the greatest need for refinancing. The ubiquitous role of the IMF is tempered by the level of internal discipline of the recipient country: the greater its prior dependence on outside financing, the greater its vulnerability to the IMF stabilisation programme. IMF regulation is thus conditional on the prior penetration of international capital, the incapacity of the local state to contain the adverse effects and the existence of internal political and social forces willing to pursue

¹⁷ M Karczmar, 'A weaker dollar won't slow imports', *New York Times*, 20 October 1985.

IMF stabilisation measures in order to re-establish the *status quo ante*—a dubious proposition given the counter-productive outcomes resulting from IMF policies.

IMF agreements with recipient countries, while differing in important details, do share some general characteristics. Before identifying these it will be useful to introduce some terminology used by the Fund.¹⁸ The reserve tranche consists of up to 100 per cent of a member's quota to the IMF and can be withdrawn unconditionally. The first credit tranche consists of the next 25 per cent of the quota and is almost unconditional although the recipient must formally show that a need for this financing exists and that some plan has been developed to resolve the balance-of-payments deficit. Other low-conditionality loans include the compensatory financing facility, the buffer-stock financing facility, the oil facilities, and the trust fund. These facilities are provided under special circumstances to developing countries. The high-conditionality loans are composed of the upper credit tranches and the extended facility. The upper credit tranches consist of one-year loans payable over a maximum period of five years. The extended facility provides loans in support of three-year long adjustment payable over a maximum period of ten years. The conditionality of the upper credit tranches takes the following form: the recipient and the IMF negotiate a stand-by agreement which consists of preconditions, performance criteria, and a letter of intent specifying a stabilisation programme.

Since IMF negotiations are conducted in secret it is extremely difficult to determine what has been agreed to except in some exceptional cases.¹⁹ An analysis of unpublished IMF documents reviewing stabilisation programmes provides us with a glimpse into the results of the secret negotiations.²⁰ A review of thirteen IMF programmes indicated that 'exchange rate actions' (devaluations) and an 'interest rate policy' (raising interest rates) were the two most common preconditions.²¹

A country is only required by the agreements to meet the performance criteria. Formally, at least, the recipient is free to ignore the IMF stabilisation programme. However, by establishing unattainable performance criteria the IMF can force a recalcitrant

¹⁸ See J. Williamson, 'The lending facilities of the Fund,' in Williamson (ed), *op. cit.*, pp 662-7; and Killick *et al.*, *op. cit.*, pp 133-41.

¹⁹ For example, Jamaica, which has published its agreements: see Killick, *et al.*, *op. cit.*, pp 141-4.

²⁰ *Ibid.*, pp 190-9, 223, endnote 1.

²¹ *Ibid.*, p 191.

recipient to implement a stabilisation programme. For example, the 1977 stand-by agreement with Jamaica involved reductions in payments deficits and the domestic money supply 'clearly out of proportion to the size of resources directly available from the Fund'.²² According to Sharpley the 1977 agreement was apparently 'a test of the general willingness of the Jamaican authorities to undertake a stabilization program'.²³ Formally, the performance criteria are fairly limited. In addition to 'standard clauses' preventing payment and new import restrictions, 'bilateral trading agreements', and 'new multiple currency arrangements' the agreements set ceilings on the expansion of credit.²⁴ In recent years agreements have also included 'restrictions on new external debt', 'minimum levels for foreign exchange reserves' and, in a few cases, a 'reduction in current payments arrears'.²⁵ Devaluations, while not formally specified in recent agreements, are common although the exact incidence is difficult to determine.²⁶ Contrary to popular belief, the performance criteria of IMF agreements are fairly limited, generally consisting of restraints on credit expansion.

The stabilisation programmes specified in 'letters of intent' contain the content which is most often associated with controversies over IMF programmes. The letters of intent have typically included taxation increases, reductions in the public sector, reductions of 'consumer goods subsidies', wage policies, and other policies directed at pricing and at publicly-owned corporations.²⁷ The letters of intent are not binding on recipient countries, but our understanding of these programmes should not be reduced to a consideration of their formal characteristics. Some regimes use letters of intent as a means of exerting leverage over other social actors. Killick *et al.* cite Panama and Uruguay as examples of countries which negotiated stand-by agreements apparently without needing credit.²⁸ The letters of intent can serve as weapons in ideological battles since they appear as technically objective programmes sanctioned by an important international institution.

The ascendancy of the IMF from the mid-1970s to the present: state-IMF relations

The majority of developing countries have utilised IMF credit and the mid-1970s marked the period of greatest use.²⁹ Historically, developing countries in the Western Hemisphere have been the greatest users of IMF credit but in recent years usage has shifted to Africa and Asia.³⁰ In absolute terms the largest users of IMF credit (as of 1979) have been 'India, Argentina, the Philippines, Chile and Pakistan [which have] accounted for 29% of total drawings by developing countries'.³¹ In terms of usage as a percentage of quota the 'largest users' have been (as of 1979) 'Nicaragua, the Philippines, Jamaica, Sri Lanka, Sudan, Chile, and Peru . . .'.³² Later we will examine the experiences of Chile and Argentina more closely. It is perhaps worth noting that all of these major users of IMF credit have been sites of considerable social conflict. Since 1979 Thailand, Turkey, Yugoslavia, several African states, and Brazil and Mexico (since 1983) have emerged as major users of IMF credit.³³

Although the majority of Third World countries have used Fund credit, the scale and the duration of IMF-supported programmes vary greatly. It is extremely misleading to generalise about the use of Fund credit when the experiences vary so widely, as for example between Zaire and Yugoslavia. There is a long continuum between countries where IMF personnel actually participate in significant ways in the day-to-day functioning of government and those whose involvement with the IMF has been limited and short term.

To understand the different impacts that the IMF has on different states it is useful to distinguish three types of IMF-state relations. Based on the degree of IMF control and regulation of the local economy we can identify:

- 1) *Subordination*: direct control by the IMF of critical positions in the local state apparatus to sustain payments in disintegrating economies;
- 2) *Convergence and subordinate agreement*: IMF programmes of stabilisation were introduced and implemented by local state and

²⁹ *ibid.*, p 153

³⁰ *ibid.*, pp 154-5

³¹ *ibid.*, p 155.

³² *ibid.*

³³ IMF, *International Financial Statistics*, 'Usage of Fund Quota Table', 1985.

entrepreneurial groups who share a common politico-economic perspective with the IMF for overcoming the structural crises of relatively developed countries; and

- 3) *Negotiation and resistance*: IMF negotiates with potential recipient but terms are either rejected or significantly modified, either by the regime or subsequently as a result of popular protest, resulting in the withdrawal of credit.

Certain countries, usually African, have been persistent users of high-conditionality credit and have accepted significant intrusions into their sovereignty. For example, Zaire has been a persistent user of IMF credit and has allowed IMF officials to occupy key positions 'in the Bank of Zaire, the Finance Ministry, the Customs Office, and [the planning agency]'.³⁴ These states, according to Gruhn, moved from colonialism to bilateral dependency with the former colonial state, to bilateral dependency with a major world power, to dependency with an international organisation.³⁵ In each case the new relationship appeared as an alternative to the earlier condition of dependency but substantially reproduced dependent structures. It is somewhat debatable whether this scheme can be generalised to all countries in this category. For Zaire, the Mobutu regime has followed a fairly classic course of comprador rule, with the state serving as the means of extracting surplus and redistributing it to non-productive dominant groups locally and internationally. The change in dependent relationships has evolved more in response to systemic changes than as a search by the Mobutu regime for alternatives.

A second category is defined by those states which have accepted IMF credit in response to structural crises resulting in short-term liquidity crises. Local economic and state power centres implement IMF economic policies through local capacities. This category would include Mexico, Brazil, Tanzania, and Kenya. Initially, development policies are advanced and implemented through a seemingly 'autonomous' apparatus. The prolonged duration of crises in these countries and the deep structural contradictions underlying them increase the leverage of the IMF and lessen the margin for local autonomous action. For Mexico and Brazil the existence of alternative sources of foreign financing in the mid-1970s was a double-edged sword; it provided immediate autonomy

³⁴ T. Callaghy, 'The ritual dance of the debt game', *Africa Report* 29(5) 1984, p. 23.

³⁵ Gruhn, 'The recolonization of Africa: international organizations on the march', *Africa Today* 30(4) 1983, pp. 37-48.

but eventually led to the current debt crisis which has forced these countries to go to the IMF in the context of increased IMF regulatory power. The important distinction for us is that these countries have moved from having developed and implemented economic policies autonomously with limited involvement from the IMF to a situation of power-sharing. Consequently, our explanation must emphasise the IMF's changing role in those states. The deep structural crisis reduces the degree of autonomous action of local actors who are oriented 'to the outside' and increases the direct role of the IMF in setting the terms of participation. While the IMF has not always played an important part in shaping development agenda, in times of profound structural crisis even the larger countries with substantial state and local entrepreneurial groups must share the designing of macro-economic practices with the IMF.

The third category is composed of those states which have resisted IMF conditionality and have attempted to forge alternative strategies. In the past Jamaica under Manley (in the last year of his regime), and Chile under Allende, were two cases. More recently, Bolivia under massive pressure from labour and peasant unions has resisted implementing IMF terms. However the opposition has no clear or coherent alternative and resistance has led to hyper-inflation. The election of the conservative Paz Estenssoro in 1985 led to the reintroduction of a severe IMF-style austerity programme with the predictable consequences of general strikes and military displays of force. In the case of the Alfonsín regime in Argentina, initial resistance provoked IMF-enforced bank boycotts forcing the government eventually to accept an IMF-style austerity programme, resulting in increasing unemployment and declining living standards. IMF-state relations were shaped by the degree of labour mobilisation and the degree of linkages between state and labour and more fundamentally the direction of the flow of influence: where the flow goes from the bottom to the top, the lateral influence of the IMF is limited; where the flow is reversed, IMF influence is maximised.

Secondly, the more developed an economy and state structure the less likely is there to be direct intervention by the IMF and subordination of the recipient country. On the other hand, even highly dynamic countries with previous records of 'relatively autonomous' growth are subject to the indirect influence of the IMF over major development agenda items. Negotiations between the state and the IMF in periods of crisis are asymmetrical, providing increasing leverage for

the IMF and greater vulnerability for the bargaining Latin American country.

Thirdly, regimes devoid of labour influence and with links to 'export-oriented groups' and local financial centres are more likely to collaborate with IMF programmes than nationally based productive sectors oriented toward local markets. Though it should be realised that these are not hard and fast lines since to the degree that local national capital finances its production from foreign capital sources and imports its technology it is in no position to break off external financial ties; what is most tempting in these circumstances is for productive classes to adapt to the new externally oriented model of accumulation and shift the costs of adjustment to local wage-earning and salaried groups.

The IMF and the monetarist-structuralist debate

Theoretical justifications and criticisms of IMF practices and monetarist theory are abundant. Despite the breadth and technical nature of this literature the essential arguments can be summarised briefly: The monetarists argue that balance-of-payments problems arise from excess local aggregate demand relative to local supply and to foreign demand of local tradeable goods. The short-term solution to excess local aggregate demand is contractive monetary and fiscal policies. Long-term economic growth requires stabilisation as a precondition and is facilitated by the liberalisation of internal and external trade. Some monetarists also call for expansion of demand in balance-of-payment surplus countries.³⁶ The critics usually adopt some type of structuralist position. They argue that monetarists tend to separate the problems of development from balance-of-payments crises. Development in the Third World has led to certain micro-economic patterns including trading relationships between countries which create long-term imbalances made manifest by balance-of-payment crises. Contractive policies, while necessary in some cases, generally solve the short-term balance-of-payments problems at the cost of restricting development and further exacerbating the contradictions underlying the crises. The assumptions of monetarism are over-simplistic, in this view, because they ignore the historical and systemic contexts of underdevelopment. On the other hand, some of the structuralists are subject to the same

³⁶ J de Larosière, 'Challenges facing the world economy and the role of the International Monetary Fund', *Atlantic Community Quarterly* 22(2) 1984, p 139.

kind of over-generalisation and simplification as their monetarist adversaries.

To illustrate this point, let us look at the case of Jamaica. Bernal argues that controlling integration into the world-economy and an expanded state role in production and distribution is a useful strategy for increasing capital accumulation in underdeveloped countries.³⁷ One way Jamaica controlled integration was through quantitative import restrictions. The IMF argues that it is best to let the market control the amount of imports, trade liberalisation plus devaluation of the local currency will accomplish the dual goals of reducing imports while allowing the free flow of goods. The result of such a policy can, however, lead to shifts in resources to trading activities—to the importation of luxury goods.

But controlling integration into the world-economy is not, by itself, a good thing. Import restrictions may serve to benefit local capitalists who use their profits for non-productive purposes or it may serve a state development plan that reserves foreign exchange resources for the purchase of capital goods. We should not forget that some of the beneficiaries of import substitution in South America and the Caribbean were multinationals which used near-monopoly conditions to extract surpluses in excess of what would have been available at international prices. Therefore, for the case of Jamaica we have to know which imports were restricted, where resources were used alternatively, and to whose benefit.

So, in addition to analysing the 'fine structure' of the productive system we also need to know the 'gross anatomy' of the distribution of economic activity, surpluses and of social wealth in general. What is the distribution of economic activity into productive and non-productive sectors, between private and public sectors, and between foreign and local owners? What did state economic policy consist of, what were its levels of financing and direct investment into production? What are the wage levels, their pattern of distribution and how was social wealth divided between labour and capital, and between consumption and accumulation? What proportion of state spending was divided into collective consumption, the construction of externalities, income to bureaucrats, and to the support of the coercive apparatus? Given this, and some understanding of the path of change due to accumulation, we can then compare this historical alternative to the actual results of trade liberalisation and devaluation.

³⁷ Bernal, *op. cit.*, pp 53-4.

The structural impact of IMF policies

IMF policies have a profound impact on the political institutions, levels of political mobilisation, social inequalities, structure of production and insertion of a national economy into the world economy. There is a pronounced tendency for IMF policies to heighten social tension and depress local industry, while increasing the level of coercion. However, the general destabilising effects of IMF policies have to be analysed together with the state structures which mediate and translate those policies into practice. Those states which have strongly penetrated civil society with a dense network of institutions and organisations (such as Mexico) are better situated to enforce IMF directives despite the extremely regressive nature of the measures. The impact of the IMF measures is then as much influenced by state-civil society relations as it is by their intrinsic nature.

There are few studies which attempt to examine the structural effects of IMF programmes.³⁸ Killick *et al.* have examined the 'effects of Fund programmes on some key macroeconomic variables . . .'.³⁹ While not answering the questions we have raised above, Killick *et al.* conclude that Fund programmes have had a statistically insignificant effect on improving the macro-economic variables.⁴⁰ IMF programmes have had difficulty in reaching stabilisation goals let alone positive effects on development. Even more extraordinary is the lack of 'association between Fund programmes and sustained liberalisation'.⁴¹ Thus, even in monetarist terms, IMF policies cannot be said to have positively improved the economic situation of recipient countries or to have liberalised world trade.

The implementation of IMF programmes requires state actions. Of course, the state, unlike its monetarist ideal, is not some exogenous super-actor existing outside civil society. The state is, on the one hand, an intermediary between foreign capital, banks, local capital, and the popular classes and, on the other, is shaped by those same social agents.

The state can be characterised in two dimensions, the mixture of means being used for legitimation and the state's relationship to civil society. Democratic states tend to achieve legitimation through redistributive and ideological means by constructing a consensus among

³⁸ See Bernal, *op. cit.*, and J Tokman, 'Global monetarism and the destruction of industry', *CEPAL*, no. 23, pp 107-21.

³⁹ Killick *et al.*, *op. cit.*, p 228.

⁴¹ *ibid.*, p 265.

groups through institutions which regulate negotiations and compromises between antagonistic groups. Authoritarian states tend to achieve legitimation by using coercion to limit or shape dissent by some social groups. The IMF stabilisation programmes with their class-selective austerity programmes, severely depressing wages, income, credits and imports, heighten social and political polarisation and conflict leading to increased repression. In a word, the IMF programmes result in a severe blurring of the distinction between democratic and authoritarian regimes. Elected regimes pursuing IMF stabilisation have in recent years been among the most repressive as the cases of Peru under Belaunde, the Dominican Republic under Blanco and Jamaica under Seaga attest. IMF agreements play an important role in delegitimising elected regimes and increasing the level of coercion while undermining the process of securing a national consensus and the possibility of pursuing redistributive policies. The outcome is built into the class bias present in the 'free market' solutions propounded by IMF ideologues.

An extremely important factor shaping the impact of IMF policies is the relationship between state and private institutions. Some states in Latin America are characterised by relatively limited linkages between institutions while others will have dense linkages. State institutions can be deeply integrated with other institutions and pervade all aspects of social life. States with dense linkages tend to be able to control and channel dissent and conflict with selective use of direct coercion or rapid changes in the redistribution of the surplus while states with weak linkages are either easily destabilised or are forced to resort to more extreme measures of direct coercion or to the cementing of social compromises by relatively large expenditures of surplus. The types of linkages will mediate a state's capacity to respond to opposition to IMF-designed austerity programmes. The mixture of means of legitimation of a regime will determine the form that response will take.

In contemporary Latin America it is possible to observe two different historical patterns of response to IMF austerity packages. In some states, such as Mexico, the state has penetrated deeply throughout civil society, controlling almost all state and local governments and mass associations. Argentina under the military and Chile under Pinochet lack effective penetration of civil society: the opposition is a dominant force among organised labour, students and neighbourhood groups while the military controls the state apparatus. Brazil under the military was an intermediary case, with some influence through its civilian

organisation but still lacking the durable and dense networks of Mexico. As a consequence, the Mexican regime was able to impose one of the harshest austerity programmes in the Third World with a minimum of opposition. On the other hand, the military regimes of Chile, Argentina and Brazil encountered mass, sustained opposition, which in the case of Brazil, at least, forced the regime to renegotiate its terms of agreement with the IMF. The Mexican regime's effective use of the party-state organisation allowed it to combine repression with political manipulation of social groups, while in the military regimes, coercion gave way, at least in the case of Brazil and Argentina, to a change of regimes. In summary, the response of the populace cannot be gauged by the harshness of the austerity programme but by the degree of state legitimacy and the density of linkages with civil society.

In Argentina and Chile the Peronist and Allende regimes of the early 1970s attempted to appeal to a broad alliance of antagonistic classes and rejected IMF-dictated austerity programmes. These alliances were cemented, not by deep linkages between the state and civil institutions, but through concessional state expenditures to class organisations. In avoiding the discipline of the IMF the regimes proceeded to evade imposing their own financial discipline. In Chile loans and credits from the state to the bourgeoisie and petty bourgeoisie were 'channeled through the leadership and organizations of the Right' and contributed to the increase of imports, provoking balance-of-payments difficulties and inflationary pressure.⁴² The social expense of concessional payments to both labour and capital became too high and too difficult to finance with the onset of the first oil shock in 1973. Competition over scarce resources threatened the accumulation process and the class struggle intensified. In Chile the annual inflation rate rose from 22.1 per cent in 1971 to 508 per cent in 1973 and in Argentina it rose from 40.1 per cent in 1974 to 335 per cent in 1975.⁴³ Insofar as these states failed to impose their own form of austerity and control based on their own class commitments, their position became untenable and ended in the establishment of military dictatorships, which were willing and able to implement IMF-style austerity programmes with all of their negative consequences for the masses.

⁴² J Petras, 'Reflections on the Chilean experience: the petty bourgeoisie and the working class', in J Petras (ed), *Critical Perspectives on Imperialism and Social Class in the Third World*, New York: Monthly Review Press, 1978, p 205.

⁴³ S Marshall *et al.*, *op. cit.*, pp 277-8.

The military dictatorships in Chile and Argentina were granted IMF credits in the period after the establishment of their regimes. In 1975 Argentina suffered a \$1,107 million balance-of-payments deficit and in 1976 was granted 260 million SDR from the IMF. Similarly in 1973 Chile had a \$112 million balance-of-payments deficit and was given 79 million SDR in IMF credits.⁴⁴ In both Chile and Argentina ceilings were set on the expansion of bank credit and in Chile interest rates were also monitored by the IMF.⁴⁵ In Chile and Argentina limits were set on credit to the public sector and on government expenditures.⁴⁶ In addition to these measures, balance-of-payments tests were established which required Chile to undertake a substantial devaluation.⁴⁷ The agreement with Chile and the IMF explicitly called for real wage increases and the liberalisation of prices. In 1975 an indexation programme was implemented. However, real wage levels dropped precipitously and did not recover their high level of 1970 thereafter. The IMF did not cut off funding when that criterion was missed. However, inflation was controlled by contractive 'monetary and fiscal policies' which resulted in massive unemployment.⁴⁸ In Argentina, wage increases were implemented at below the rate of inflation.⁴⁹

Because the military dictatorships were in total control of society through terror, torture and disappearances, the implementation of the IMF agreements during the late 1970s was fairly successful. In Argentina liberalisation programmes were implemented and most performance targets were met to the IMF's satisfaction.⁵⁰ In Chile inflation and credit expansion 'greatly exceeded' the IMF's ceilings but liberalisation policies were implemented. Chile succeeded in reducing its balance-of-payments deficit and its obligations to the Fund were repaid. We are told that 'relations between the Fund and Chile since 1974 have been very good' and that Santiago was privileged to be host to IMF representatives during the five-year period following the coup.⁵¹

IMF successes and the decline of industry, labour, income and employment

The 'successful' implementation of the IMF programme in Argentina and Chile was accompanied by structural changes that weakened the industrialisation process. Industrial employment in Argentina declined from 32.4 per cent of non-agricultural employment in 1974 to 24.2 per cent in 1981 and in Chile it sank from 24 per cent in 1970-1 to 19.1 per cent in 1981.⁵² The volume of industrial production in Argentina in 1982 was 83 per cent of the 1974 level and in Chile the drop was slightly greater.⁵³ These declines in the manufacturing sector are especially dramatic, according to Tokman, when one considers that in the late 1960s and early 1970s this sector was growing.⁵⁴ In addition, the industrial output of other Latin American countries rose by 3.8 per cent per year between 1974 and 1980.⁵⁵ Since the decline of manufacturing in these countries neither corresponds to the historical trends in these countries, nor to international trends, Tokman states that it 'signifies a disruption of industrial development' that was 'a product of the policies pursued during this period'.⁵⁶

The destruction of industry in these countries involved the liquidation of the productive assets and not merely the accumulation of under-utilised capacity.⁵⁷ In Chile bankruptcies rose from 356 per year in 1975 to 3,521 per year in 1982. In Argentina, during the same period, bankruptcies rose from 46 per year to 142 per year. Contrary to expectations, this did not result in increased concentration—the hardest hit were the largest firms.⁵⁸ Nor was labour moved to more productive activities. In Argentina, approximately 52 per cent of the unemployed manufacturing workers remained unemployed or were employed in 'low-productivity' activities and in Chile 50 per cent remained unemployed and the other half fell into low-productivity activities and government make-work programmes.⁵⁹ In Argentina, employment in the 'informal sector' grew by 25.6 per cent during the 1970s and in Chile the growth rate was 17.9 per cent.⁶⁰ The application of IMF

programmes resulted in a decline in the development of the productive system. IMF regulation of capital had the effect of restructuring the relations between productive and non-productive capital, increasing the latter at the expense of the former. At the same time it restructured the relations between the advanced capitalist countries and these Latin American economies, once more increasing their dependence on foreign manufactured imports and increasing their dependence on the export of primary products.

The relationship between labour and capital during this period also changed. The unit cost of labour declined by 47 per cent in Argentina between 1974 and 1982 and declined by 31 per cent in Chile between 1970 and 1982.⁶¹ Aglietta has argued that changes in the unit labour cost (which he calls the 'real social wage cost') is an inverse indicator of changes in the rate of surplus value.⁶² Since this change in the rate of surplus value does not correspond to increases in industrial output it could be achieved only by heightening the absolute exploitation of the working class. This is supported by the evidence reported above concerning changes in the structure of employment and wage levels.

The dismantling of a broad array of manufacturing enterprises—the deindustrialisation of Chile and Argentina—totally undermines the IMF's notion that its stabilisation programme is a prelude to the reactivation of their economies and the structure of their development. Besides the considerable distance needed to catch up to the 'potential' growth that was lost during the preceding decade, IMF programmes have increased their technological lag behind the newly industrialised countries. Even at the level of reaching IMF stabilisation goals the two countries were not successful. By the 1980s, economic depression was matched by inflation and a serious balance-of-payments crisis. The IMF programmes, through contractionary fiscal and monetary policies, provoked a decline in 'international competitive capacity'. The removal of tariff and other barriers, and a change in incentives encouraged the growth of financial speculation and participation in non-industrial activities. The result was the emergence of economies which were less developed, less competitive, increasingly dependent on new loans, and with increasingly precarious fiscal and financial status.

The IMF programmes, while increasing the rate of exploitation of labour in these countries, undermined industrial capitalists at the

⁶¹ *ibid.*, p. 115.

⁶² M. Aglietta, translated by D. Fernbach, *Theory of Capitalist Regulation. The US Experience*. London: NLB, 1979, p. 90.

expense of finance and foreign capital. It is of little benefit to capitalists to pay low wages if they have no market in which to sell their goods. The contradictory growth of finance capital, based on its parasitic relationship to productive sectors, was ultimately limited by the destruction of manufacturing in Chile and Argentina.

The dominance of financial capital was short-lived in Chile. The speculative bubble of the 1970s collapsed in 1981–2 and almost all of Chile's major private banks faced bankruptcy. The lack of regulation—part of the free-market policies of the Pinochet regime—led to bankers lending capital to themselves to take over firms, to increase their imports, and to channel funds to overseas bank accounts. The imminent collapse of the banking system forced Pinochet toward state intervention. The irony is that more banks are under state control today than was the case during the Allende period, though of course the role and nature of state intervention serves other purposes. Ironically, in the *real world of existing market economies IMF policies have had the effect of creating the very economic relations they ostensibly abhor.*

The incapacity of IMF austerity programmes to stabilise and reactivate the Argentinian economy led the Argentinian junta to seek a military–political success to contain the erosion of its support. The Falklands/Malvinas fiasco, however, merely accelerated its demise and laid the groundwork for the eventual return to an elected regime. In Chile, the failure of the IMF programme has led to a massive upsurge of popular protest, a return to mid-1970s-style state repression (ie torture, kidnappings, and assassinations) and even more generous outlays of IMF and collaborative bank financing. Thus, the political consequences for regimes implementing unsuccessful programmes vary: in the case of Argentina, democratisation; in the Chilean context, polarisation and intensified repression. Already in democratic Argentina the Alfonsín regime's agreement to IMF austerity programmes is leading to increasing unemployment and declining wage levels. The lack of dense linkages with either the labour movement or the military portends difficult times for the Alfonsín regime. The initial support (June–November 1985) engendered by Alfonsín for his austerity programme is not likely to be sustained.⁶³ As wages lag behind price increases and as bankruptcies and unemployment increase it is only a matter of time before the labour movement begins a new round of militant struggle. Lacking the capacity to link economic discipline with internal

⁶³ In late October 1985, Alfonsín was forced to declare a state of siege in the midst of right-wing terror bombings.

transformative changes, the Alfonsín regime is forced to rely on the discipline of the IMF with all of the political costs that this implies.

Conclusion

The cumulative effect of IMF policies is reshaping the global economy. The role of conditionality— austerity programmes tied to new credits— has led to increased flows of funds to metropolitan countries, the undermining of locally owned enterprises and the shrinking of the local market.

IMF policies purport to deal with specific (balance-of-payments) problems but in fact have profound effects on the whole economy. In their broadest forms, IMF policies and debt crises have resulted in a reconcentration of income and productive forces on a world scale. However, the IMF does not act alone nor is it the only force propagating its particular brand of development policies. Local dominant classes are able to use the same criticism of instability to invoke and support economic austerity, thus justifying the reduction of social expenditures and the redistribution of income toward capital. The pivotal institution affecting the introduction and implementation of IMF policies is the state: the collaboration or resistance of national forces is decisive in shaping IMF impact.

The historical impact of the IMF in stabilising economies in Latin America is problematical. For elected regimes—such as the recent cases of Peru under Belaunde, Bolivia under Siles, Manley and now Seaga in Jamaica—the record is abundantly clear: implementation of IMF austerity programmes is inversely related to electoral success. Apart from the electoral process the deeper meaning of austerity is found in the restructuring of the economy—its greater vulnerability to external control—and in the human cost exacted by the disintegration of the social infrastructure constructed in the post-war period. Austerity is the refocusing of the anarchy of the market on to the masses. The political consequences, however, are not as drastic as one might expect. The question may be asked: Can austerity invoke a revolutionary upheaval? The answer up to now has been negative. While regime changes and policy alterations have occurred under mass pressure, the movements to revise IMF policies have been hegemonised by middle-class forces. Austerity affects a broad array of classes which leads attention to be focused on the IMF and its policies and diverts attention from the

underlying structural forces that allowed the IMF to become a significant actor in the first place.

The post-war expansion of capital resulted in the growth of the demands of the working class and local capitalists because it provided the space for those demands to be met. The initial success of the working class in meeting its economic goals amplified its demands and eventually threatened the relations underlying the accumulation process. The crisis which followed expansion provided the justification for austerity policies which attempted to readjust relationships and allow the reproduction of capitalist production relations.

But this process is not automatic. The crisis continues and deprivation of labour may have reached its limits. The continued reproduction and extension of the debt crisis-austerity process can lead to movements seeking to redefine relations to banks, the IMF, and the market. To date, the IMF functions to ensure that the crisis does not lead to forced autarchy and the cessation of international trade. The threat is real; the crisis of the 1930s led to the virtual end of international trade and the replacement of economic imperialism with military imperialism. In terms of ensuring the short-term liquidity of capital in international trade, the IMF has been relatively successful, but, as we have seen, the long-term impact of the IMF on development has been disastrous. The measures taken to achieve short-term liquidity have increased long-term risks to the system by increasing inequalities and reducing the ability of the IMF to implement policies. Calls for a new international economic order to address the long-term needs for equality, stabilisation and development have been unsuccessful. No institutional mechanism exists by which the Western capitalist countries could be forced to reduce or would acquiesce in reducing their advantages. The interests of international capital are being met by transferring the costs of global instability on to the deficit countries and their popular classes by limiting IMF credit to amounts merely sufficient for crisis management and by shaping the adjustment policies required to reduce balance-of-payments deficits. In fact the Reagan administration has encouraged, at least in its first years, the reduction of IMF commitments. The increase in IMF resources in 1983-4 was combined with institutional changes limiting the access of individual countries to those resources.⁶⁴ The growth in the militancy of popular classes has been countered by the increased use of the US military and ideological

⁶⁴ R Wood, 'The aid regime and international debt: crisis and structural adjustment', *Development and Change* (16) 1985, p 188.

support for global repressive measures. The development of Latin American countries cannot depend on a hope for an expanded international commitment to long-term stabilisation and development but on fundamental social transformation internally, more selective forms of integration with the world-economy and through the creation of alternative resources for stabilisation and development.

Aid through trade: reforming the international trade regime in the interests of the Least Developed Countries

The most significant change in the international trade regime in the past twenty-five years has been the undermining of its norms of non-discrimination and reciprocity. This has occurred primarily in the trade relations between industrialised and developing countries. On the one hand, there has been a proliferation of informal, discriminatory non-tariff measures against the exports of developing countries. On a more positive note, the principal formal amendment to the GATT has been to the advantage of developing countries in granting them discriminatory tariff preferences without an obligation for reciprocity. A growing awareness of the increasing differentiation which has occurred within the Group of 77 since its formation has led in turn to a second level of discrimination—among LDCs—according to their levels of development.

Measures within GATT in favour of developing countries focused initially on the supply side of their export trade by allowing them special exemptions from tariff reductions on account of developmental and balance-of-payments needs. These were reinforced by the granting of an exemption from the requirement for reciprocity in tariff concessions by the addition of a new Part IV to the GATT in 1965. On the demand side, a waiver in 1971, initially for a ten-year period, of Article I of the treaty permitted the introduction of Generalised System of Preferences (GSP) schemes in violation of the non-discriminatory requirement of according 'most favoured nation' (MFN) status. This waiver was made permanent in an 'enabling clause' added at the time of the conclusion of the Tokyo Round negotiations. For the first time GATT

This is a revised version of a paper presented to a panel organised by the Research Committee on a New International Economic Order at the International Political Science Association World Congress in Paris, July 1985. I am grateful to LIZ Kirby for research assistance, and to the editor and referees of *Third World Quarterly* for their helpful comments.

also recognised that 'special' treatment could and should be given to the least developed countries (PMA).¹

Since the UN General Assembly designated a group of countries as 'least developed' in 1971, a 'least developed clause' has become part of the litany of international negotiations.² But despite the promise of special measures in their favour, the holding of a special UN conference on their behalf in 1981, and the launching of the Substantial New Programme of Action (SNPA), the economic performance of the PMA as a group over the last fifteen years has been little short of catastrophic. Many countries are currently no better off in terms of per capita GNP than they were in 1960. The gap between their performances and those of other developing—as well as industrialised—countries has continued to widen. Whereas the mean annual rate of growth in per capita for all developing countries was 2.9 per cent in the years 1960–70, and 3.1 per cent in the years 1970–80, the mean figures for the PMA were respectively 0.3 per cent and 0.4 per cent. In 1981 the average per capita income in the PMA was \$227, only slightly over one-fifth of the average for all developing countries.³

Certainly, the capricious behaviour of governments in some least developed countries has contributed to their poor economic performance. PMA economies, already particularly vulnerable to natural vicissitudes, have had more than their share of human-induced disasters. Ultimately, as the SNPA emphasises, measures in their favour on the part of the international community will only succeed if accompanied by the necessary domestic policy reforms. Primary responsibility for their future development rests with the PMA states themselves. A compelling case can be made, however, that the vicious

¹ Finding a suitable acronym for the least developed countries is problematic. UNCTAD uses 'LDCs' which tends to be confusing given the conventional application of LDC to all less developed countries. The EEC uses 'LDC' which not only has no logical connection with the word 'least' but is again apt to confuse when the acronym LDC is employed at the same time. In an attempt to minimise the problem, I have employed the French acronym for the least developed, PMA (les pays les moins avancés).

² The first resolution suggesting specific measures in favour of the least developed countries was adopted by UNCTAD in New Delhi in 1968. The initial list of twenty-four least developed countries adopted by the UN General Assembly in 1971 included Afghanistan, Benin, Bhutan, Botswana, Burundi, Chad, Ethiopia, Guinea, Haiti, the Lao People's Democratic Republic, Lesotho, Malawi, Maldives, Mali, Nepal, Niger, Rwanda, Somalia, Sudan, Uganda, United Republic of Tanzania, Upper Volta (now Burkina Faso), Samoa and the Yemen Arab Republic. In 1975 four countries were added (Bangladesh, Central African Republic, Democratic Yemen and The Gambia); in 1977 Cape Verde and the Comoros; in 1981 Guinea-Bissau; and in 1981 Djibouti, Equatorial Guinea, São Tomé and Príncipe, Sierra Leone and Togo to complete the current list of thirty-six.

³ UNCTAD, *The Least Developed Countries 1984 Report*, New York: United Nations, 1984 (TD/B/1027) p. 3.

circle of economic and political instability in which many of the PMA are entwined is not entirely of their own making. They have been, for instance, among the principal victims of commodity price instability. Whatever the causes of their current plight, there is general agreement that sustained improvement in their economies will be possible only if domestic reform is supported by increased international assistance. To date, this has not been forthcoming. To the original criticisms that the SNPA was neither substantial nor new, one can add that there has been very little action since the Paris conference. Recent cutbacks in IDA funding and in the World Bank's sub-Saharan Africa facility are not propitious for the future.

To some, the plight of the PMA and their failure to participate effectively in the expansion of world trade has suggested a new form of triage; whereas the more advanced developing countries can be assisted through trade measures, action on behalf of the least developed should be confined to overseas development assistance, the assumption being that the PMA are incapable of taking advantage of trade preferences.⁴ This paper rejects this line of reasoning. While the PMA certainly need increased development assistance, the long-term viability of these countries depends upon their participating more fully in the expansion of world trade. All the evidence supports the view that trade is indeed the handmaiden of growth.⁵ If the least developed countries had achieved an additional 5 per cent growth in the value of their exports in 1983 (not a large increase in historical perspective—all non-oil-exporting developing countries enjoyed an average increase in export earnings of 21.3 per cent in 1970–80 compared to the mean for the PMA group of 13.1 per cent) an extra \$350 million in foreign exchange would have been earned. Sustained over three years, this increase alone would generate more revenue than the World Bank will provide through its sub-Saharan Africa facility.

The poor growth performance of the PMA can be attributed in large part to their lack of success in increasing their exports over the last two decades. Trade preferences cannot in themselves be expected to

⁴ This increasingly appears to have been the attitude of the EEC in its relations with the ACP Group (which contains twenty-seven of the thirty-six designated least developed countries). In the transition from the first to the third Lomé Convention, there has been a significant change in emphasis from trade to aid.

⁵ Carlos F Díaz-Alejandro and Gerald K Helleiner, *Handmaiden in Distress. World Trade in the 1980s*. Washington DC: Overseas Development Council, 1982. This theme is reinforced by the evidence presented by advocates of export-oriented industrialisation. For example, Anne O rueger, *Foreign Trade Regimes and Economic Development*, Cambridge, Mass.: Ballinger, 1978, and the World Bank's annual *World Development Report*.

produce a dramatic transformation of the economies of the PMA in the foreseeable future. Improved compensatory finance and additional development assistance will be necessary if the PMA are to reverse their disastrous economic performances of the last two decades. Nevertheless, if the security of trade advantages is assured, the PMA will at least be offered an opportunity to compete more effectively in international markets, to attract additional investment, and to reduce their dependence on foreign aid—all predicated on the assumption that the necessary reforms in domestic economic policy will be undertaken.

This article first examines the reasons for the recent poor trade performance of the PMA; it then considers the measures that might be taken to reform the international trade regime in the interests of the least developed. These include, first, measures to promote the diversification of exports from the PMA by granting their exports of processed and manufactured goods preferences over those from *both* industrialised *and* other developing countries and, secondly, measures to stabilise and increase their earnings from their existing exports.

The Least Developed Countries in world trade

Designation of a country as 'least developed', as UNCTAD admits, has been 'somewhat arbitrary'.⁶ In constructing its original list of twenty-four countries, the UN's Committee on Development Planning considered three criteria: a) a per capita income of less than \$100 (in 1960 dollars—currently equivalent to more than \$350); b) a share of manufacturing in GDP of no more than 10 per cent; c) an adult literacy rate of no more than 20 per cent. Least developed country designation has become a sought-after status given the prospect that it will bring additional concessions in the fields of both aid and trade (although Malawi initially rejected the designation, apparently considering it demeaning and fearing that it would have negative repercussions on foreign investment). Unlike membership of the Group of 77, least-developed status is not self-selected; Djibouti, the Seychelles, Senegal and Liberia have all had applications to join the least developed club turned down (although Djibouti was subsequently admitted). There are certainly a number of countries (particularly in sub-Saharan Africa) that could be added to the list without damaging its integrity. Meanwhile the circumstances of some countries have improved considerably since

⁶ UNCTAD, *The Least Developed Countries and Action in their Favour by the International Community*, New York: United Nations, 1983 (A/CONF. 104/2/Rev. 1), p. 26.

the original list was devised (e.g., Botswana, where mineral exports have increased significantly). No country has yet been removed from the list; should this graduation prove necessary it will be particularly controversial. While the cut-off point for least developed status remains arbitrary and the distinction between the group and other low-income countries is blurred, there is clearly a wide gap between the socio-economic characteristics and economic performance of these low-income countries, on the one hand, and middle-income developing countries.⁷

That the majority of the PMA are African is surely no accident. Africa was the least developed of the non-Western areas at the time of its colonisation; the African region was the last to be decolonised. While colonial powers did not always discourage processing of raw materials and the establishment of manufacturing industries, they did little actively to encourage it. Latecomers to independence, African countries were also latecomers to manufacturing production. When they gained their political independence, these countries found that export markets for the types of simple, labour-intensive manufactures that they might feasibly undertake were already becoming saturated by exports from other countries.

Most of the PMA group gained their sovereignty in the late 1950s and early 1960s. At that time they were heavily dependent on the markets of the former colonial metropolises for the export of their raw materials and agricultural products. Patterns of trade were long established, having been fostered by preferential trade arrangements such as the Commonwealth Preference Scheme, restrictive currency areas such as the franc zone, and, more directly, mercantilist policies of managed markets as was typical of France's relations with its colonies prior to the establishment of the European Economic Community. Although some trade diversification has taken place over the last twenty-five years, the continued importance of these traditional markets is seen in the dominant role of the EEC in PMA exports. In 1982 the PMA were nearly twice as dependent on the EEC market than all non-OPEC developing countries (see Table 1).

Almost simultaneously with the achievement of independence,

⁷ For additional discussion on the criteria for membership in the least developed group see Thomas G Weiss and Anthony Jennings, 'What are the Least Developed Countries and what benefits may result from the Paris Conference?' *World Development* 11(4) April 1983, pp 337-57; and Shahid Qadir, 'UN Conference on the Least Developed Countries, neither breakthrough nor breakdown', *Third World Quarterly* 4(1) January 1982, p 134.

however, the protected position of these countries in their traditional markets began to be eroded. Successive rounds of multilateral trade negotiations within GATT led to a general lowering of tariffs, thereby weakening the position of countries which enjoyed duty-free preferential access to particular markets. Within the EEC, member-states with a more globalist outlook, most notably West Germany and the Netherlands, succeeded in reducing the common external tariff on items of interest to their additional LDC trading partners, moves that came at the expense of the (usually lower income) countries associated with the EEC through the Yaoundé Conventions. Subsequently, the introduction of GSP schemes and, particularly in the case of the EEC, their extension to include agricultural products that were non-competitive with domestic production, increasingly offered other developing countries similar access for their exports to those of traditional preferential partners.⁸

The experience of the last fifteen years suggests that the PMA are unable to compete in international trade when placed on an equal footing with middle-income developing countries. As a result, in UNCTAD's terminology, there has been an increasing marginalisation of these countries in world trade. By 1980 their share in global trade was only one quarter of that enjoyed in 1950: a fall from 1.6 per cent to 0.8 per cent in 1970 was followed by a further decline to 0.4 per cent in 1980.⁹ There are two principal reasons for this: the commodity composition of PMA exports and the loss of their market shares in their principal commodity exports to the more advanced developing countries.

⁸ This process context is examined in John Ravenhill, *Collective Clientelism: The Lomé Conventions and North-South Relations*, New York: Columbia University Press, 1985, Chapters 2 and 4.

⁹ UNCTAD, *The Least Developed Countries 1984 Report*, *op. cit.*, p. 39.

Most important of the factors contributing to the marginalisation of the PMA in world trade is the commodity composition of their exports. Since World War II the most dynamic sector of world trade has been manufactured goods. For the PMA as a group, however, manufactured products constituted only 14 per cent of their exports in 1980, a figure merely 2 per cent above that sector's share in 1961. Seventeen of the group, however, had negligible manufactured exports (less than 3 per cent of their total export value). In contrast, the mean share of manufactures in the exports of all non-OPEC developing countries rose from 23.3 per cent in 1970 to 37 per cent in 1980. Whereas the PMA only doubled the value of their manufactured exports in the 1970-80 period, that of non-oil developing countries as a group increased more than tenfold.¹⁰ Manufacturing accounts for an average of 8 per cent of GDP in the PMA compared to 17 per cent in all developing countries; in per capita terms, manufacturing value added in the PMA is only one-tenth of the average for all developing countries.¹¹

The PMA group still depend on food and agricultural raw materials for 57 per cent of the value of their exports (compared to a mean of under 30 per cent for all non-OPEC LDCs). For many of these products, the volume of world trade is growing only slowly. Over the years 1961-80 the volume of world trade for their two most valuable exports, coffee and cotton, increased by only 1.3 per cent and 1.0 per cent respectively on average each year. Of their next two most valuable agricultural exports in 1961, jute and groundnuts, the volume of world trade *declined* by almost one half in the following two decades, an annual decline of about 4 per cent. As a result, the principal increase in export earnings for the PMA over the last two decades has been derived from price rises: UNCTAD estimates that the volume of PMA exports increased by 60 per cent in the 1960-80 period whereas their unit value rose threefold. This, however, was still below the increase in the value of their imports with the result that the PMA suffered a significant deterioration of their terms of trade in this period.¹² UNCTAD data also show a coefficient of export-earnings instability for the PMA group substantially more than the mean for all developing countries.¹³ A principal reason is that only two commodities account for 50 per cent or more of the exports of thirty of the least developed group.

¹⁰ *ibid.*, pp 50-1.

¹² UNCTAD, *The Least Developed Countries 1984 Report*, op. cit., pp 42-5.

¹³ *ibid.*, p. 56.

Loss of market shares to middle-income developing countries has been the other major cause of the poor trade performance of the PMA. This is reflected in the data in Table 2. Of the principal agricultural exports of the PMA listed there, the share of the PMA in total developing country exports of these products in the period 1970 to 1980 declined for all commodities except sugar (an anomaly examined later in this article). A number of factors explain these declining market shares. Some of the middle-income LDCs, e.g., Brazil and Malaysia, have invested heavily in agricultural production, perceiving agricultural exports as a means of financing the capital goods imports essential to their development plans. In the process, they have become far more efficient producers of some agricultural products than the PMA; they often have better contacts with transnational marketing companies, and are more proficient at quality control. To assume that the PMA necessarily have a comparative advantage in the export of agricultural products is mistaken.¹⁴ In contrast, many of the governments of the PMA, especially those in African countries, have been guilty of anti-agricultural bias in their economic policies. Whatever the short-term political rationality underlying overvalued exchange rates and unfavourable rural-urban terms of trade, their principal effect has been to cause a decline in the production of crops for the world market.¹⁵ As a group, the PMA have moved from a position of being net exporters of food in the early 1960s to significant net importers. Finally, part of the explanation lies in the natural disasters that have beset some of the PMA, especially the countries of the Sahel and their neighbours in West Africa.

As a consequence of their poor export performance, and of the increase in prices of their principal imports, the PMA have experienced large current account deficits. Matters were exacerbated by the price declines experienced by many of their exports in the early 1980s. This has had a number of repercussions. In that many of their imports are necessities—fuel and foodstuffs account on average for over 35 per cent of the total—attempts to reduce current account deficits by curtailment of imports have frequently led to shortages of spare parts for domestic manufacturing industries which, consequently, have seldom operate

¹⁴ I make this case in more detail in discussing the World Bank's *Accelerated Development Sub-Saharan Africa* in 'Africa's continuing crises: the elusiveness of development' in Jol Ravenhill (ed) *Africa in Economic Crisis*, New York: Columbia University Press, and London: Macmillan, 1986, Chapter 1.

at close to full capacity. The value of PMA imports in 1983 was 10 per cent below the 1980 level. Secondly, despite the lack of access of most PMA to private lending, there has been a significant rise in the external indebtedness of the PMA; between 1978 and 1982 the total outstanding medium and long-term debt of the group increased by 68 per cent to \$26.2 billion. In the same period the debt service payments rose from 11 per cent to 15 per cent of the group's export earnings. Many of the group will face acute debt servicing problems for the remainder of the decade. Private investment flows, which have declined since the mid-1970s, will offer little relief. Thirdly, the PMA have become increasingly dependent on overseas development assistance. By 1980 the group's receipts from development assistance exceeded the value of its export earnings. In 1982 exports covered only 42 per cent of the value of imports. If this trend towards ever-increasing dependence on aid is to be reversed the PMA will have to achieve a significant increase in their export purchasing power.

Table 3: Comparison of GSP coverage and usage for PMA and all beneficiaries

	PMA GROUP			ALL BENEFICIARIES

Can trade measures help?

Sceptics who have questioned whether preferential trade measures will be of value to the least developed countries have put forward four principal lines of argument. The first asserts that the exports of least developed countries generally are not subject to trade barriers: being primarily agricultural products and raw materials, they enter markets duty-free. A second argument questions whether trade preferences are of any value in the contemporary world economy, given the generally low level of tariffs. The third line of reasoning proposes that all developing countries would be better off if MFN duties were lowered: rather than concentrating on gaining special treatment, developing countries should rather seek a general lowering of tariffs. The fourth argument suggests that even if in principle trade preferences could assist the least developed, these countries are incapable of taking advantage of them.

Trade barriers

The argument that PMA exports do not face significant trade barriers can be dismissed on two grounds: most importantly, it has little factual basis and, secondly, even to the limited extent that it is an accurate characterisation of the prevailing situation, the argument rests on static assumptions regarding the nature of least developed countries' exports.

Table 3 belies the sometimes popular notion that all exports from least developed countries enjoy duty-free access to industrialised countries' markets. Data presented there, the latest available from UNCTAD, show the percentage of PMA exports subject to MFN duties ranged from a low of 7.6 per cent in Canada to 92.5 per cent in Switzerland. The weighted mean for the group of countries in the table was 44.7 per cent. Tariff exemptions arising from the provisions of the various generalised systems of preference achieve no more than a partial removal of the barriers to PMA exports. The percentage of MFN dutiable imports included within the GSP schemes ranges from a low of 16.1 per cent in Japan to the 100 per cent coverage provided by Norway's scheme. These figures, however, are hypothetical maxima which have seldom been realised since the GSP was introduced. More relevant is the actual utilisation of the access afforded by the scheme (imports under the schemes as a percentage of potential total import coverage) shown in column 4 of the table. Again there were significant variations between donors, ranging from 19 per cent for the

Canadian scheme to over 60 per cent for the EEC and Swedish GSP. The last column reports the value of imports admitted under the GSP as a percentage of total imports subject to MFN duties. On average, fewer than one-quarter of PMA exports subject to MFN duties actually enter OECD markets duty-free under the various GSP schemes.¹⁶

Comparable data for all developing countries are also presented in Table 3 in order to permit an assessment of whether the PMA enjoy better terms of access for their exports than other developing countries. In general, a smaller percentage of PMA exports than those of other developing countries is MFN dutiable. PMA dutiable exports were also more likely to be accorded GSP coverage (with the exceptions of Austria, Japan, and Sweden). In five of the eight cases, including their two largest markets (the EEC and the US) but not their third (Japan), a larger proportion of MFN dutiable imports from the PMA entered duty-free under the GSP than was true for all developing countries. But it was also the case in five of the eight countries that the PMA were less successful in exploiting the schemes than were other developing countries. Although this table provides some evidence of more generous treatment for the exports of the least developed, the relationship is by no means as strong as might have been expected.¹⁷

The reasons for the restricted coverage and limited take-up of GSP preferences have been extensively documented. These apply with even more force to the least developed countries and explain why they have been less successful than other developing countries in making use of the schemes. Firstly, most of the schemes exclude, *ab initio*, products that are regarded as sensitive by donor countries. Typically, these are agricultural products in potential competition with domestic production, and labour-intensive manufactures such as clothing, footwear and textiles. Unfortunately, from the PMA perspective, these are the very products which either they currently export or which they

¹⁶ The data in the table permit a quick calculation of the value and percentage of PMA imports that were subject to MFN duties. For instance, for the USA, 16.6 per cent of dutiable imports entered under the GSP scheme. 83.4 per cent of MFN dutiable imports were actually subject to duty. This amounts to $34.1 \text{ per cent} \times 0.834 = 28.4 \text{ per cent}$ of total US imports from the PMA, goods to the value of \$239.9m in 1982.

¹⁷ This finding accords with other examinations of GSP schemes. Sapir and Lundberg for instance, report that in the US GSP, the share of GSP-eligible imports in total imports and the percentage margin of preferences have little relation to per capita income. Quoted in Jere R Behrman, 'Rethinking global negotiations: trade' in Jagdish N Bhagwati and John Gerard Ruggie (eds) *Power, Passions and Purpose*, Cambridge, Mass.: MIT Press, 1984 p 244. As will be discussed below, however, several countries have improved their GSP schemes for the least developed in the past few years.

might feasibly export in the near future given their very low levels of industrialisation.

Secondly, many of the products included within the schemes are subject to value, volume and/or country quotas. Where ceilings are placed on the value of imports of a product to benefit from GSP treatment, as in the EEC and Japanese schemes, considerable uncertainty is introduced into the operation of the GSP. Typically, there is a scramble among potential suppliers to be the first to fill the quotas. Least developed countries, given the small size of their bureaucracies and their lack of expertise, are seldom well-equipped for this competition. In that these quotas are closely linked to existing quantities supplied (and thus can be met without difficulty from the established suppliers, many of which have considerable surplus capacity), there is no incentive for latecomers to the market, such as the least developed, to invest in the production of these goods.

Country quotas such as the US provisions for graduation of suppliers of more than a specified percentage or value of imports of a product have placed further limitations on product and country coverage. Incredible as it seems, four least developed countries (Bangladesh, Botswana, Haiti, and the Maldives) were all graduated at one time from the US GSP on the grounds of their lack of 'competitive need'.¹⁸ The other major limitation on the schemes—their restrictive rules of origin—have probably had a more significant negative effect on the least developed group than on most other developing countries. Requirements that a certain percentage of value be added locally (often 50–60 per cent) and/or substantial transformation occur such that the manufactured product is classified under a different tariff heading, are clearly beyond the capacity of many of the resource-poor least developed given their small industrial base.¹⁹ In addition, many of the

¹⁸ In 1982, for instance, 37 per cent of GSP-eligible exports from Bangladesh and 25.6 per cent of these from Haiti were excluded from the US GSP on the grounds that the products from these countries exceeded competitive needs limits. UNCTAD, *Eighth General Report on the Implementation of the Generalized System of Preferences* (TD/B/C.5/90), Geneva, 26 March 1984, Annex II, p. 3.

Least developed countries have been exempted from the competitive needs provisions of the revised US GSP which entered into force in January 1985. The new US scheme, however, continues to completely exclude four least developed countries—Afghanistan, Ethiopia, the Lao People's Democratic Republic and Democratic Yemen—on political grounds.

¹⁹ The problems that low-income countries face in complying with rules of origin have been extensively documented in the context of the Lomé Convention (whose rules are identical to those that the EEC employs for its GSP scheme). See, for example, Matthew McQueen, 'Lomé and the protective effect of rules of origin' *Journal of World Trade Law* 16(2) March–April, 1982, and Ravenhill, *Collective Clientelism*, *op. cit.*, Chapter 4.

procedures for complying with the rules of origin—particularly those of the US scheme—are so complex that they are themselves often regarded as non-tariff barriers.

Since the adoption of the SNPA, industrialised countries have made a number of improvements in their GSP schemes in favour of the least developed. Typically, these have exempted the PMA from quotas through an assurance of unlimited access for products covered by the scheme. This removes their vulnerability to both country and overall volume ceilings. Other limitations of the schemes, especially product exclusions and rules of origin, continue to apply. Meanwhile, other policy measures of the industrialised countries, especially the continuing imposition of consumption taxes on, for example, tropical beverages, have the effect of considerably reducing demand for commodities of special interest to the least developed.

For many economists the most important contemporary impediments to developing countries achieving an increase in their exports are not tariffs but non-tariff barriers (NTBs). Table 4 provides estimates of the proportion of exports from least developed countries subject to non-tariff barriers. According to this data collected by UNCTAD, as much as 27 per cent of current PMA total exports are subject to non-tariff barriers. Most of this figure is attributable to volume restraints on agricultural exports, particularly in Western Europe resulting from the European Community's Common Agricultural Policy.

Industrial exports from the PMA have fared far better. To dwell at length on the small share of PMA industrial exports subject to NTBs, however, would be to adopt a rigid approach. Like other developing countries, the PMA have suffered from the uncertainty generated in the international trading regime as a result of the proliferation of NTBs. As latecomers to manufacturing for international markets, they are in particular need of a guarantee for future outlets for their products if they are to attract the necessary investments in their domestic manufacturing sector. Uncertainty of future access for their products to the markets of industrialised countries, as the World Bank points out, quite likely has had a more detrimental effect on latecomers to manufacturing production than on countries which have already established their export-oriented industries:

The worst result of the increased protectionism may be a greater unwillingness on the part of many developing countries to risk more outward-looking trade policies, even where these are urgently needed . . . Partly for this reason, and

Table 4: Share of imports from the PMA subject to selected direct import control measures (1983) (percentages)

* Imports receiving automatic authorisations but subject to price and/or volume surveillance. These measures are designed to facilitate action to regulate the prices and volume of imports should this be deemed necessary by the importing country. Since these measures create uncertainty and encourage exporters to exercise self-restraint, UNCTAD considers them to have the effect of non-tariff barriers.

** Excludes Greece

partly because very low quotas are being imposed on new entrants in such obvious first industries as textiles and clothing, the adverse effects of heightened protectionism may be felt more by the poorer and less successful developing countries than by the most successful and vigorous targets.²⁰

The little evidence that is available regarding PMA manufacturing suggests that these countries are, not surprisingly, following the long-established development pattern of initially producing labour-intensive manufactures in industries where technologies are mature.²¹ Those PMA that have succeeded in exporting large quantities of manufactured goods (other than processed mineral products) have predominantly produced textiles (Bangladesh and Nepal) and clothing and sporting goods (Haiti), the 'sensitive' goods which have been excluded from GSP schemes and/or subjected to non-tariff barriers. In the present trade regime, the PMA have no more certain access for their exports of these products than have other developing countries. And, because of their relatively unsophisticated industrial structures, and the lack of expertise of their bureaucracies, the least developed can be expected to be less proficient than the NICs at circumventing NTBs.²²

The accuracy of the World Bank's comments was shown clearly in the European Community's response to an increase in exports of woollen manufactures from the African, Caribbean and Pacific (ACP) Group associated with it through the Lomé Conventions. Despite the 'privileged' nature of the relationship that the EEC states it has created for the ACP (supposedly freeing their exports of manufactures from all tariff and non-tariff barriers), and despite the ACP Group's low levels of development and very small share of the EEC market, the Community negotiated a voluntary export restraint with Mauritius and found it necessary to warn the ACP Group that their exports to the EEC were being closely monitored. According to Community representatives, ACP countries (which include the majority of the PMA), could not be expected to be treated differently in the EEC's 'global' policy towards imports of sensitive products. This undoubtedly has encouraged other developing countries to insist that members of the

²⁰ World Bank, *World Development Report 1979*, New York: Oxford University Press, 1979, p. 22.

²¹ This pattern, pursued first by Japan and then by the newly industrialising countries, is now being followed by a group of 'New Exporting Countries' which succeeded in rapidly expanding their exports of manufactured goods in the 1970s. See Oli Havrylyshyn and Iraj Alikhani, 'Is there cause for export optimism? An inquiry into the existence of a second generation of successful exporters', *Weltwirtschaftliches Archiv* 118(4) (1982) pp 651-63.

PMA group be included in discussions on orderly marketing arrangements, e.g., Tanzania in talks with the EEC on exports of rope and string.²³

Preferential margins

A second line of reasoning against offering trading preferences to the least developed is based on the argument that tariff and other barriers in the contemporary international trade regime are so low that the margin of preference that can be offered is so small as to have no significant effect on trade. I have already suggested above that the position of the PMA in their traditional markets has been adversely affected by the reduction in their preferential margins. There is, however, a major leap from acknowledging this to suggesting that either existing or potential margins of preference have no significance at all.

The percentage of trade of developing countries in general, and the PMA in particular, which is subject to MFN duties has already been presented in Table 3. While it is the case that the various rounds of multilateral trade negotiations within GATT have reduced the tariffs faced by the products of developing countries, it is well established that their exports face higher tariff barriers than those of industrialised countries. The World Bank acknowledged, for instance, that 'the Tokyo Round tariff cuts discriminate against developing countries'.²⁴ When the Tokyo Round reductions are completely implemented, the weighted average tariff faced by the semi-finished and finished manufactures from developing countries will be 8.7 per cent in the US in comparison to a weighted average of 4.9 per cent for imports of these products from all sources. The equivalent figures for the EEC are 6.8 per cent and 5.4 per cent respectively; for Japan, 6.7 per cent and 6.0 per cent. Average tariffs on products regarded as 'sensitive' are much higher. For all developed countries combined, the weighted average tariff post-Tokyo Round for finished manufactures of textiles and clothing will be 16.7 per cent; for leather, footwear, rubber and travel goods 10.2 per cent.²⁵

Escalation of tariffs according to degree of fabrication continues to be a prominent feature of the international trade regime. For the major

²³ The ACP Group's experience in exporting 'sensitive' products to the EEC is detailed in Ravenhill, *Collective Clientelism*, pp 171-81.

²⁴ *World Development Report 1979*, op. cit., p 22.

²⁵ Bela and Carol Balassa, 'Industrial protection in the developed countries', *The World Economy* 7(2) (June 1984) p 181.

developed countries, the post-Tokyo Round average tariffs are 0.5 per cent for raw materials, 3.5 per cent for semi-manufactures, and 5.7 per cent for finished manufactures.²⁶ As a result, the effective rate of protection afforded by the tariffs to processing and manufacturing industries in importing countries is substantially above the nominal tariff rate. This factor, plus the higher average tariffs on developing country imports, provide *a priori* grounds for believing that tariff preferences continue to be of some potential value.

Further support for this conclusion is provided by the limited evidence available on the effects of graduating some of the NICs from certain categories of products previously admitted duty-free under the US GSP scheme. A study by the Korean Traders' Association submitted to the US Trade Policy Staff Committee suggested that those making the principal gains when major GSP beneficiaries were graduated were other industrialised (non-beneficiary) countries. Countries that were graduated and thus denied preferential access were apparently unable to compete on equal terms with developed country suppliers. Smaller gains accrued to other major GSP beneficiaries which continued to enjoy duty-free access.²⁷ These findings substantiate the perception that the main effect of contemporary GSP schemes, given the imposition of quotas for many products which effectively limit the possibilities of trade expansion, is trade diversion rather than trade creation. This is reinforced by studies by the US International Trade Commission which found that in many areas where GSP imports had increased, this had occurred primarily at the expense of imports from industrialised countries; the overall market penetration was little changed.²⁸

²⁷ Cited in UNCTAD, *Eighth General Report on the Implementation of the Generalized System of Preferences*, Geneva: UNCTAD, 26 March 1984 (TD/B/C.5/90) Annex II pp 2, 4. The UNCTAD Secretariat, in its own study of graduation from the US GSP, presented in *ibid.*, concludes that the major beneficiaries have been other industrialised countries and that imports of the products decreased from other beneficiaries of the GSP scheme 'probably as a result of the feared "insecurity" of access under the United States scheme'. The evidence that UNCTAD presents in support of this conclusion is not so clear cut, however. Of sixty-one cases where graduation occurred, the total value of imports fell in twenty-five, suggesting that domestic producers were major beneficiaries of the graduation exercise. Imports actually increased in twenty-two others. In twenty-six cases, the share of GSP beneficiaries in total imports fell, in twenty-two others it rose. Calculations based on data presented in *ibid.*, Table 1.

²⁸ Cited in UNCTAD, *Ninth General Report on the Implementation of the Generalized System of Preferences*, Geneva: UNCTAD, 20 February 1985 (TD/B/C.5/96) p. 8. A study prepared for the UNCTAD Secretariat, using fairly heroic assumptions, suggests that approximately one-quarter of GSP imports each year could be attributed to GSP-induced trade expansion. Cited in *ibid.*, p. 18.

Whether the principal effect of the GSP actually is trade diversion or trade creation matters less to this argument than the evidence that GSP status appears to play a substantial role in determining sources of imports. Contrary to some arguments, preferential tariff treatment, even in the era of lower tariffs which prevails in the contemporary international trade regime, can make a significant difference. And if duty-free access plays a significant role, we can assume that a guaranteed exemption from non-tariff barriers would be even more important.

Potential gains from MFN cuts

Critics of the process whereby the fundamental norms of the GATT system have been undermined by making exceptions for less developed countries have long argued that all countries would be better off if an across-the-board cut in tariffs was made rather than the granting of special preferences. In addition, a return to more uniform treatment under GATT has been advocated—recently, for example, by Wolf and Behrman—as a means of preventing further erosion of the liberal norms of the regime. While special preferences are acknowledged to have assisted developing countries, these authors argue that their existence has encouraged industrialised countries to depart further from the norms of the system by introducing discriminatory non-tariff barriers. Their assumption, then, is that if LDCs agree to uniform treatment in the system, industrialised countries are more likely to play by the rules of the free-trade game.²⁹

This is indeed an heroic assumption. On past performance, developing countries have little reason to have faith in it. After all, the Short-Term Cotton Arrangement and subsequent Long-Term Arrangement, the precursors to the Multifibres Arrangement, the most notorious of the orderly marketing arrangements, were signed in 1961 and 1962, *before* the introduction of special preferences for LDC exports with the addition of Part IV of GATT in 1965. Industrialised countries have erected non-tariff barriers against NIC exports of manufactures despite the fact that they have for a long period run an aggregate surplus on their balance of trade in manufactures with these countries.³⁰ The argument also seems to assume that there was once a

²⁹ Martin Wolf, 'Two-edged sword: demands of developing countries and the trading system', and Jere Behrman, 'Rethinking global negotiations: trade' both in Bhagwati and Ruggie (eds.), *Power, Passions and Purpose*, *op. cit.*, pp 201–29 and 231–58.

³⁰ See, for instance, OECD, *The Impact of the Newly Industrialising Countries*, Paris: OECD, 1979.

golden age of GATT-sponsored free trade from which we have recently departed. In reality, products of particular interest to many developing countries, especially those in the agricultural sector, have always been effectively excluded from MTN under GATT. In addition, developing countries' exports historically have been discriminated against in GATT-negotiated tariff reductions, in part because of the principle of reciprocity that underlies these negotiations. Another weakness in the argument is that many of the NTBs created since 1980 have been imposed on the exports of other industrialised countries which, of course, are not beneficiaries of GATT-sanctioned privileged exemptions to MFN treatment.

To assume that a renunciation of special preferences by developing countries will induce industrialised countries to respect the rules of the free-trade game is naively to extract the international trading regime from its political context. Ruggie has made a powerful argument that the post-war trade and monetary regimes were devised simultaneously to accomplish two objectives: international liberalisation, and stabilisation of the domestic economy. The compromise outcome he terms 'embedded liberalism': liberal international norms were constrained by domestic socio-economic objectives.³¹ The increasing resort to NTBs must be perceived in this context as an attempt to continue to attain these domestic objectives in the face of dramatic structural changes in the world economy. The desire to pursue such domestic goals as minimising unemployment, sustaining depressed regions, etc, rather than the granting of special privileges to developing countries, has dictated the increasing resort to protectionism.

Developing countries, then, have good reasons for believing that they will not be treated equally in future trade negotiations—regardless of their own behaviour. Let us assume for the moment, however, that this is not the case; on the contrary, that a future round of trade negotiations will lead to across-the-board cuts which equalise tariff rates regardless of source of imports, degree of processing of imports, etc. Will developing countries in general, and the PMA in particular, gain more from these than from the extension of special preferences through the GSP? Here everything depends on the counterfactual assumptions that are made regarding quota limitations and non-tariff barriers of 'sensitive' products. Proponents of MFN cuts assume that these will be

³¹ John Gerard Ruggie, 'International regimes, transactions, and change: embedded liberalism in the postwar economic order', *International Organization* 36(2) Spring, 1982.

removed as part of the process of trade liberalisation. With this dubious assumption, MFN cuts inevitably will appear more attractive than the present limited system of GSP schemes. Remove it, and the issue is less clear cut.

While it may be the case that global welfare would be maximised if MFN duties were abolished, this does not necessarily mean that developing countries will always be better off ceding their special preferences in favour of universal tariff reductions. The problem is that calculations of welfare gains arising from tariff reductions have paid little attention to the *distribution* of these benefits among participating countries. Trade diversion from industrialised country suppliers to developing countries is one of the principal repercussions of the creation of special preferences for LDCs. If special preferences are removed then the trade diversion effect will disappear. UNCTAD has calculated, for instance, that if this trade diversion effect is taken into account, developing countries as a whole would make more welfare gains if products of particular interest to them were admitted duty-free under enlarged GSP schemes than if MFN duties on these products were abolished. UNCTAD also points out that the larger increase in total imports if MFN duties were abolished is more likely to lead to a proliferation of NTBs in industrialised countries given the additional pressure it will exert on domestic producers.

From this scenario UNCTAD concludes that 'it may, therefore, be less costly and hence politically more acceptable for the preference-granting (importing) countries to opt for preferential trade liberalisation, rather than MFN reductions.'³² UNCTAD's assumptions, however, are obviously as politically naive as those made by the advocates of MFN cuts. Why it should be more politically acceptable to industrialised countries to remove all tariffs on imports from developing countries while maintaining them on imports from other industrialised countries is not justified. In that neither of the scenarios put forward by the MFN and GSP proponents are likely to be realised, their assumptions and conclusions are less important to the argument here than the point that trade diversion is an important phenomenon and that more attention needs to be paid to the distribution of gains from tariff reductions.

In particular, if there is serious concern for the interests of the least developed, more attention needs to be given to the erosion of their

³² UNCTAD, *Ninth General Report*, p 18.

preferential margins not only *vis-à-vis* industrialised countries but also more advanced developing countries. There is evidence that the least developed countries' position in their traditional markets has been adversely affected by the reduction of their tariff preferences as a result of MFN cuts and the introduction of the GSP. This certainly appears to have been the case in the relationship between the EEC and the ACP Group. Similarly, Helleiner quotes World Bank study calculations that tropical Africa will suffer a net loss from the Tokyo Round's MFN cuts as a result of the erosion of preferential margins.¹³ The true effects of loss of preferential margins are impossible to estimate, however, since one of their consequences is to deter investment in production for export which might otherwise have been made had continuation of preferential margins been guaranteed. Static calculations of welfare losses are again likely seriously to under-estimate the total effect.

Can the PMA exploit trade advantages?

The fourth argument against favouring the PMA in the international trade regime is to suggest that they are incapable of exploiting trade advantages. Therefore, it is asserted, the administrative effort required to implement a discriminatory tariff programme simply is not justifiable.

Least developed countries do labour under formidable handicaps. Weak economic infrastructure and geographical disadvantages are often compounded by incompetent and sometimes corrupt political administration. Political instability and capricious actions towards foreign companies have frequently alienated or deterred foreign investment. Only if the necessary measures are taken to reduce anti-export bias in their economies as recommended by the World Bank and the IMF in recent years, eg. exchange rate depreciation, will the foundations for international competitiveness be laid.

Realistically, manufacturing for export will not become a dominant feature of the economies of the vast majority of the PMA for the foreseeable future. But this is not to accept the argument that trade preferences will make no difference or that the PMA are completely incapable of exploiting them.

A surprising number of the PMA group have enjoyed some success in

¹³ Gerald K Helleiner, 'The new industrial protectionism and the developing countries', *Trade and Development* (1) Spring, 1979 p. 34. Helleiner's scepticism towards the claims that LDC interests would benefit most from MFN cuts was justified by the differential treatment given to LDC exports in the Tokyo Round

recent years in diversifying their exports. Haiti, whose light manufacturing exports have grown rapidly, has been the most dramatic example. Similarly, exports of canned fish now account for 25 per cent of the total earnings of the Maldives. But many other countries made a start in the 1970s in moving away from complete dependence on the export of raw materials and traditional agricultural products, although many nascent manufacturing industries have suffered setbacks as a repercussion of declining import capacity since 1979. A study of countries associated with the EEC through the Lomé Conventions found a considerable diversity of new exports from least developed countries.³⁴ A cursory glance at EEC import statistics shows, for example, that in the years from 1979 to 1983, the Community imported clothing from such least developed countries as Benin, Botswana, Burkina Faso, Burundi, Chad, Sierra Leone, Somalia, Tanzania and Togo. Although the value of imports in many cases remains small, for some countries, eg. Benin and Togo, annual earnings at times have been in excess of \$1 million, a significant boost to exports. Similarly, furniture was imported in this period from such diverse countries as Benin, Botswana, the Central African Republic, Chad, Congo, Niger, Rwanda, Somalia, Sudan, Tanzania, Togo and Uganda. Tanzania's exports of instant coffee to the EEC were worth more than \$1 million in 1983. More than one-third (over \$1.5 million) of Lesotho's export earnings to the Community were from umbrellas in 1979-81. Other countries enjoyed success in exporting fresh flowers.

Although no one would claim that the value of many of these non-traditional exports is enormous or that the progress of the PMA has been spectacular compared to the record of many other developing countries, the diversity of exports and the countries involved is testimony to the ability of even the least developed group to produce non-traditional exports. Arguments against granting preferences to the least developed on the grounds that they will not be able to exploit them sound suspiciously like an excuse for protectionism from people who perceive that significant trade advantages may indeed be taken up, inevitably at some cost to domestic producers in industrialised countries.

Christopher Stevens and Ann Weston, 'Trade diversification: has Lomé helped?' in Stevens (ed), *The EEC and the Third World: A Survey (4) Renegotiating Lomé*, London: Hodder and Stoughton, 1984, Ch 2.

Trade measures to help the least developed

The argument so far can be summed up as follows. A principal reason for the lack of economic growth in the least developed countries over the past fifteen years has been their poor export performance. In part this is due to their specialisation in products for which the world market is increasing only slowly. They have also been adversely affected by movements in their terms of trade. As a result, their export earnings currently cover less than 50 per cent of the cost of their imports. Unless trade performance is improved the group will become perpetually dependent on foreign aid. Despite the preferences granted under GATT to developing countries in general, and the least developed in particular, a substantial proportion of the exports of the PMA are still subject to tariff and non-tariff barriers. Although overall levels of tariffs have been reduced, those affecting LDC exports are higher than those for industrialised countries' exports; evidence from the evaluations of the GSP schemes suggest that preferential margins can be decisive in determining sources of imports. Thus opportunities are available for giving preferential advantages to the least developed countries which can be of significance and, which, it has been argued, most of the PMA will be able to exploit. If the international community is sincere in its commitment to the least developed, it will implement trade preferences which give the PMA an advantage not only over industrialised country suppliers but also over other developing countries.

The obvious ideal solution to the trade needs of the least developed is to grant access for all their current and future exports completely free of tariff and non-tariff barriers. Since we inhabit a second-best world, however, this proposal is as naive as the assumptions made by the proponents of MFN cuts as the answer to developing countries' trade problems. A realistic analysis has to begin with the acknowledgement of the continued determination of industrialised countries to protect their domestic agricultural producers. At best the least developed might hope for improved access for some of their competitive agricultural products in the Northern 'off-season'. In addition they might obtain a commitment (more likely brought about by domestic budgetary pressures than a concern for the least developed) on the part of developed countries, most notably the EEC, not to produce surpluses above domestic consumption of agricultural products which compete with those which are major exports from developing countries. The dumping of surplus EEC beef and sugar, for instance, has had a

significant negative impact on the markets of LDC producers (which include some of the PMA group).

Rather than advocating total free access for all PMA exports, a more realistic approach is to propose an improvement of the GSP schemes in favour of the least developed. Here there should be four guiding principles: enlargement of GSP schemes to provide for tariff-free access for all manufactured products from the PMA; graduation of more advanced LDC producers from GSP treatment of certain categories of 'sensitive' products; long-term security of access for PMA exporters; and relaxation of the rules of origin for least developed producers. Underlying all of these proposals is the idea that the least developed will succeed in significantly increasing their exports of manufacturers and processed products *only* if they are given better access to the markets of the industrialised countries than is enjoyed by other developing countries. If real advantages for the least developed are to be created these will inevitably be partly at the expense of other developing countries.

First, considerable improvements can be made in the list of products covered by the GSP schemes. At the present time, two principal categories of manufactured products are excluded: processed agricultural products and manufactures regarded as 'sensitive'. Even if agricultural products remain outside the scope of multilateral trade negotiations, largely as they have from the initiation of GATT, there is less justification in terms of safeguarding the interests of the rural sector for excluding processed agricultural products, especially where the agricultural raw material is not grown locally. Processing industries are a part of the manufacturing sector; here, structural adjustment should be expected. Currently, domestic processing industries enjoy high effective rate of protection as a result of the escalation of tariffs with degree of processing. One factor underlying the weakness of PMA economies is that they export a small percentage of their agricultural and raw materials production in processed forms than other developing countries.

Even under the GSP, imports into the EEC, for instance, of cigarettes are subject to 70 per cent duty; pineapple juice encounters a 17 per cent tariff plus variable levies; jams and marmalades 19 per cent tariff plus variable levies; while chocolate attracts a 9 per cent duty, variable charges plus additional duties dependent on its sugar content. In the past three years the EEC has moved to give preferential GSP treatment to PMA exporters of some of these products. In particular, it has

abolished duties on a number of products in Chapters 1 to 24 of the Customs Cooperation Council Nomenclature on which ACP suppliers already received preference. These include tobacco, roasted coffee, jams and marmalades, but exclude other items such as tinned pineapples. Although this may be welcomed as a move in the right direction, it falls far short of complete coverage of processed agricultural products. Some imports are also still to be subject to variable charges and additional duties based on flour and sugar content. As yet, the EEC's liberalisation of access for processed agricultural products is but partial and other industrialised countries have not followed its example; given the complexity of the regulations, PMA exporters may well have difficulty in determining what treatment their products will receive. Security of access is not assured.

'Sensitive' products are the second major category either excluded completely from GSP coverage (as has frequently been true of the US scheme) or subject to quotas (as in the EEC scheme). They are also, of course, the products subjected to non-tariff barriers. Traditionally these have been labour-intensive manufactures such as clothing, textiles, footwear, etc. As the newly industrialising countries have progressed to more sophisticated manufactures such as steel, electrical machinery, and even, in the case of South Korea, automobiles, so these too have been added to the list of sensitive products to which quota limitations are applied. Most developing countries have begun their manufacturing exports with products from the first category; that least developing countries are following this pattern has already been noted. As latecomers to export manufacturing, least developed countries face markets for their most feasible exports which are already saturated by the products of the newly industrialising countries.

As income levels and wages in the newly industrialised countries have increased so their comparative advantage in low-cost labour has begun to be slowly eroded. As a result, some labour-intensive industries have already been shifted to countries with lower labour costs such as Sri Lanka and Mauritius. Eventually, the least developed might expect to benefit from this shift in comparative advantage. The process is, however, a slow one and there are many countries in the queue ahead of them. Accordingly, they need additional advantages, created through preferential trade provisions, if they are to have an opportunity to compete successfully.

Although most of the least developed enjoy unlimited access for manufactured products included in GSP schemes, this in itself does not

provide them with the tariff advantages and security of access that they need. A first step would be to grant the least developed duty-free treatment for all processed and manufactured exports, including products currently excluded from some GSP schemes. Duty-free access in itself would provide the PMA with a marginal advantage over other developing country suppliers; this could be reinforced through a three-pronged strategy. The first element would be the 'graduation' of the NICs from GSP benefits for certain products that might feasibly be produced by the least developed. The second element, a necessary accompaniment to the first, would be an assurance of access for the products of the PMA for a sufficient period that potential investors would be attracted. Finally, concessions to the PMA on rules of origin also are necessary.

Graduation has become one of the most sensitive topics in international trade negotiations. To date, the principle has been opposed by UNCTAD and all members of the Group of 77 apparently on the grounds of Group solidarity, the right of self-election to developing country status, and because of the fear that it will introduce additional insecurity for all into the operation of GSP schemes.³⁵ Whether the least developed are wise to put group solidarity before their own material interests is debatable; it is a principle that has been far from universally followed by members of the Group of 77 up until now. The very designation of a category of least developed countries by the UN—following UNCTAD pressure—legitimised the differentiation of the Group of 77. And, given the structure of existing preferential systems, it is difficult to see how the least developed group can be given effective trade advantages as specified by the SNPA unless new preferences are created by removing some of these currently enjoyed by more developed members of the Group of 77.³⁶

Although usually justified in the name of ensuring a wider distribution of benefits to developing countries from the GSP, graduation has frequently appeared suspiciously like a further move to protect domestic production in industrialised countries. The interests of the least developed will not be served by graduating the NICs from products which the PMA cannot feasibly hope to produce in the foreseeable future, eg, steel, petrochemicals, and electrical machinery.

³⁵ Helen O'Neill, 'HICs, MICs, NICs and LICs: some elements in the political economy of graduation and differentiation', *World Development* 12(7) (July, 1984) pp 693-712.

³⁶ Fear that the creation of the least developed designation would indeed legitimate differential and selective treatment for members of the Group of 77 was a major factor behind the lukewarm support for the concept from some of the higher income developing countries in the 1960s.

On the other hand, the NICs currently dominate the take-up of tariff quotas created by GSP schemes for relatively unsophisticated labour-intensive products such as textiles, clothing, footwear, etc. There is a need for the exercise of common sense on the graduation issue. Over the past three decades considerable evidence has been accumulated on the products that countries typically produce in their first stage of export manufacturing. Meanwhile, the bureaucracies of importing countries have gained a great deal of expertise in monitoring imports from developing countries. There is no reason why industrialised countries could not draw up a list of 'sensitive' products that might feasibly be produced by the least developed. The current major beneficiaries from the GSP scheme could then be 'graduated' over a period of years from GSP coverage for these products. Compensation could be offered through the removal of non-tariff barriers on more sophisticated products of interest to NIC exporters.

Coupled with the pressure of higher wage rates in the newly industrialising countries, their removal from beneficiary status for this range of relatively unsophisticated products should encourage investment to shift in favour of lower-wage beneficiary countries. In itself this might be expected to provide only a marginal benefit for the PMA for there are a large number of countries at intermediate levels of development that would probably be more attractive locations for foreign investment. Accordingly, the advantage of the PMA needs to be reinforced by providing for security of access for future exports and through a relaxation of the rules of origin.

As part of their response to the SNPA, most industrialised countries have now removed quantitative restrictions on imports from least developed countries of products included within their GSP schemes. This, however, provides little security for potential investors owing to the continued subjection of some PMA exports to 'monitoring', the imposition of voluntary export restraints on certain products even from countries having 'privileged' trading relations with industrialised countries, and the failure to reach agreement within GATT on the application of safeguard clauses. Probably the greatest single trade advantage that could be given to any developing country is a guarantee of secure access for its exports for a specific period. The special needs of the least developed might best be recognised by a pledge from industrialised countries that PMA exports of processed goods and manufactures will not be subject to non-tariff-barriers for a period of, say, fifteen years.

There are no watertight guarantees in the international trade regime. Owing to the predominance of domestic objectives over the commitment to international liberalisation, industrialised countries have frequently evaded the responsibilities that they have undertaken in international trade agreements whether these be within GATT or, for example, the EEC. A commitment to the least developed countries could be broken just as easily, particularly since there would be little prospect of retaliatory action from the injured party. Like all trade pledges, the force of this one would depend largely on the unwillingness of the countries concerned to be perceived to be breaking their international commitments. In this case, this desire to avoid embarrassment might be even more pertinent given the weakness of the victim. Some teeth could be added to the pledge if, under GATT auspices, penalties would be applied and compensation provided to the victim in the event of the pledge being broken. Least developed countries would also have to play their part by refusing to agree to 'voluntary' export restraints and thus forcing the 'hidden' resort to safeguard action out into the open.

Even with the additional trade advantages proposed here, it is highly improbable that PMA exporters of manufactures will themselves cause any significant damage to domestic production in industrialised countries. At the present time, however, importing countries treat PMA exports merely as part of a 'global' problem, often perceiving these latecomers as a final intolerable increment to already high import levels. If investment in least developed countries is to be attractive, differential treatment of imports from the PMA will be essential in order to provide the necessary security.

The final component of the package of preferences for the least developed would be a relaxation of the rules of origin. Their effect as a non-tariff barrier has already been noted. At the very minimum, there should be provision for cumulation of value added among all least developed countries, and for components purchased from the importing industrialised country. Ideally, this should be supplemented by a reduction in the value-added criterion to 30 per cent. To date, only Canada has made a significant concession to the least developed on this issue by reducing the percentage local value-added requirement for exports from least developed countries from 60 per cent to 40 per cent.

Promoting current exports

Even if all of the elements of the proposed package of preferential trade measures in favour of the least developed are introduced, the impact on their export earnings in the immediate future is likely to be quite small. An effective trade package for the PMA thus also needs to provide assistance for their current exports. As noted above, many of the least developed have faced three major problems: slow growth in world trade in their principal exports; instability of export earnings; and declining shares in world markets for their principal agricultural exports.

World Bank projections suggest that the least developed will face even less favourable market conditions for their principal exports in the next decade. 'A sizeable fall' in the real prices of coffee, cocoa, and tea compared with the average levels for the last two decades is projected. For palm oil and groundnuts, the trend will be the same although somewhat less pronounced. Cotton prices are also expected to decline in real terms. Meanwhile, the volume of world trade in these products is expected to grow very slowly, on average by less than 3 per cent per annum.³⁷ Competition for markets for these commodities can be expected to be even more severe.

To date, action by the international community to reduce the harmful effects of export earnings instability has had only a limited impact. An UNCTAD study showed that least developed countries had the lowest rate of compensation among all developing countries of export earnings shortfalls from the International Monetary Fund's Compensatory Financing Facility (CFF). The reason is that loans from the CFF cannot exceed a country's maximum drawing rights at the Fund; since the PMA have small IMF quotas, their drawing rights are correspondingly very limited.³⁸ Members of the least developed group that are linked with the EEC through the Lomé Convention qualify for compensation for export earnings shortfalls under the STABEX scheme. Although this has provided significant benefits for some members of the group—most notably, Benin, Ethiopia, Guinea-Bissau, Niger and Tanzania—the scheme has a number of shortcomings in its product coverage; limitation (with few exceptions) to earnings from trade with the EEC, and th

³⁷ World Bank, *Accelerated Development in Sub-Saharan Africa*, (Washington DC: World Bank 1981) p 22. World Bank, *Sub-Saharan Africa: Progress Report on Development Prospects and Programs*, Washington DC: World Bank, 1983, p 4.

³⁸ UNCTAD, *Review of the operation of the compensatory financing facility of the International Monetary Fund* (TD/B/C.1/243).

method of calculation of earnings shortfalls.³⁹ France proposed at the time of the Paris Conference on the least developed that STABEX be extended to all members of the group. The EEC agreed to take up this proposal in 1985. A study by the EEC Commission showed, however, that as a result of the scheme's restrictions on product and direction of trade coverage there would be few benefits to countries not already members of the ACP Group.

As a group, least developed countries are twice as dependent on earnings from commodities included within the Integrated Programme for Commodities than the mean for all developing countries (in 1982 41.0 per cent of total group earnings were derived from the eighteen IPC commodities compared with 20.4 per cent of all earnings of non-oil-exporting LDCs).⁴⁰ Least developed countries thus might be expected to gain from the implementation of the Common Fund and the negotiation of new agreements under the Integrated Programme for Commodities, although they accounted for only 4.5 per cent of developing country exports and 2.7 per cent of world exports of the eighteen commodities in 1981. There appears little likelihood of agreement on the implementation/extension of the Common Fund in the near future, however, or on the negotiation of new commodity agreements given the particular aversion of the current US administration to these types of arrangements. Accordingly, we must look beyond global commodity agreements to help the least developed.

Clearly there is a need for considerably expanded provision of trade-related concessional finance for the least developed. A strong case can be made that these countries were the principal victims of the downturn in international commodity prices that occurred from 1978 to 1983. Not only were the least developed particularly dependent on export earnings from a few commodities, their compensation for loss of export earnings from the CFF was extremely limited, and, in comparison with many of the middle-income countries, their access to private sources of finance was negligible. STABEX provided only partial relief for some members of the group; its impact was particularly limited when compensation for shortfalls was reduced after available funds were exhausted in 1981 and 1982. Improvement of the CFF

³⁹ Further discussion of the shortcomings of the STABEX scheme and a comparison between it and the CFF is found in John Ravenhill, 'What is to be done for Third World commodity exporters? An evaluation of the STABEX scheme', *International Organization* 38(3) Summer 1984 pp 537-74. This study shows that the least developed countries derived greater benefits from STABEX than from the CFF in the period 1975-82.

⁴⁰ UNCTAD, *The Least Developed Countries 1984 Report*, p 61.

appears the most feasible route since the EEC is unlikely to improve STABEX to cover all destinations earnings and non-agricultural products. This might be achieved through: (i) enlargement of the drawing rights of the least developed such that they are sufficient to fully compensate for losses in export earnings; (ii) amendment of the formula for calculating earnings trends to allow for indexation to the prices of imported manufactured goods; (iii) more generous terms of borrowing for the least developed (either interest free loans or grants, as is the case with the STABEX scheme).

Although compensatory finance can help overcome the problems associated with fluctuations in export earnings, it does not address the other dimensions of the commodity difficulties faced by the PMA, namely, an apparently secular decline in the real prices of their principal exports, and a loss in their market shares. These can be resolved only through some form of international commodity agreement.

A first step would be to give larger quotas to least developed countries within existing international commodity agreements. Inevitably, as with other preferences in the trade field, this would come primarily at the expense of other developing countries. If least developed members were unable to fill their enlarged quotas by the end of a year, the balance in that year would be available for other states. However, with failure to reach agreement on a new International Sugar Agreement and a new International Cocoa Agreement, and the collapse of the International Tin Agreement, there is only one ICA in operation which attempts to stabilise prices; the International Coffee Organisation. Global commodity agreements thus offer few prospects for aiding the least developed in the near future, even if other countries were willing to cede some of their quotas to least-developing producers.

The alternative is for groups of importing countries to establish some form of managed market—the arrangement enjoyed by colonies in the French market before the implementation of the Treaty of Rome, and by Commonwealth sugar producers in the UK market. Currently there are two arrangements of this type in relations between the EEC and the ACP Group under the Lomé Conventions. Contrary to the provisions of the Treaty of Rome, there is no free market for bananas within the Community. France, Italy and the UK maintain licensing arrangements which limit imports to their traditional suppliers; former colonies and present overseas departments and territories. The second form of managed market is established by the Sugar Protocol attached to the first Lomé Convention. This provides for the admission of specified

quantities of sugar from ACP countries to be sold at a guaranteed price 'within the price range obtaining in the Community'.

Bananas and sugar were two of only five of the twenty most important exports of the ACP in which the Group sustained an increased share of the EEC market in the 1975–82 period.⁴¹ Managed markets thus appear to be the most effective answer to the least developed countries' problem of increasing inability to compete with other developing country producers, a problem reflected in their declining market shares. When guaranteed outlets for specific quantities of their exports are linked with guaranteed prices then two of the three principal difficulties faced by their traditional exports are largely ameliorated. The third problem—instability of export earnings—is also addressed to the extent that the source of instability is variation in prices. For most agricultural commodities, however, the principal source of instability of earnings is fluctuations in supply. Managed markets thus need to be complemented by improved compensatory finance to resolve fully the problem of export earnings instability.

Managed markets have traditionally been regarded as an anathema by most industrialised countries including the more 'globalist' members of the EEC. These feelings, of course, have only been applied to imported products; industrialised countries have found no difficulty in supporting such arrangements for their own agricultural producers. The greatest benefit to the least developed would occur if additional managed markets were introduced by the largest consumer of their traditional exports, the EEC. This proposal, in fact, was raised by the ACP Group in the negotiations for the third Lomé Convention. In essence, it would involve the extension of elements of the Common Agricultural Policy (price guarantees but only for specified quantities) to the principal agricultural imports from the least developed countries. The one case in which the Community provides guaranteed prices for an imported agricultural product, sugar, is explained by the inclusion of the product within the Common Agricultural Policy, the importance of the product to Caribbean economies, and by the unique conjunction of circumstances that led to the signing of the first Lomé Convention.⁴²

⁴¹ Joanna Moss and John Ravenhill, 'Trade developments under the Lomé Convention', *World Development* 10(10) (October 1982) pp 841–56.

⁴² Carole Webb, 'Mr Cube versus Monsieur Beet: the politics of sugar in the European Communities' in Helen Wallace, William Wallace, and Carole Webb (eds), *Policy-Making in the European Communities*, London: Wiley, 1977, pp 197–226; Ravenhill, *Collective Clientelism*, *op. cit.*, Chapter 2.

For certain, proposals for additional managed markets will be met with self-righteous cries of indignation from nominal free traders among Community member-states. These have little credibility given their *continued support for the Common Agricultural Policy*. A number of other objections can be anticipated:

- 1) Purchasing agricultural raw materials at above world prices will place Community processors and manufacturers at a disadvantage compared with their competitors which have access to the (lower prices of the) world market. Certainly, there is some validity in this argument but, first, exactly the same considerations apply to products within the Common Agricultural Policy, and, secondly, Community processing industries already enjoy extraordinarily high rates of effective protection.
- 2) It is impossible to sustain prices above their natural 'equilibrium' levels over the long term. This argument has frequently been used against UNCTAD's Integrated Programme for Commodities. As Behrman points out, however, the experience of managed markets for domestic agricultural producers has shown that it is possible to sustain prices above equilibrium levels if resources are sufficient and if motivation is strong enough due to income-distribution, political, or supply-security concerns'.⁴³
- 3) High prices and guaranteed markets will sustain inefficient producers in the least developed countries and will provide no incentive for more efficient production. Again, there is an element of truth in this assertion. Responses to it can take a number of tacks. First, although least developed countries may not be the most efficient producers of their traditional exports, they have few viable alternatives at the present time. To rob them of their traditional markets is to deprive them of their principal chance to 'pay their way' and minimise their dependence on foreign aid. Secondly, although an *a priori* argument can be made that guaranteed markets and outlets provide no incentives for greater inefficiency, an equally plausible *a priori* argument asserts the opposite; given that prices and quantities are fixed, producers have an incentive not to increase volumes but to improve the efficiency of output so that profit margins will be maximised.
- 4) For most export commodities from developing countries, governments purchase crops from domestic producers and market

⁴³ Behrman, 'Rethinking global negotiations', *op. cit.*

them through state marketing boards. Benefits from guaranteed markets and prices thus will accrue primarily to governments in the PMA and not necessarily be passed on to producers. Higher prices in the EEC may not be reflected in higher prices for domestic producers; incentives towards improvement in productive efficiency will be lost. This is indeed a classic problem which has bedevilled compensatory financing schemes.⁴⁴ It is made even more acute when the legitimacy is acknowledged of diverting some of the finance to other productive activities in order to promote economic diversification. Given the fungibility of foreign exchange, the ability of third countries to enforce conditionality on recipients is extremely limited. The best that can be expected here is that governments will realise that an anti-agricultural bias is not only economically irrational but increasingly politically irrational in the short term given the growing economic crisis faced by these countries which has been exacerbated by foreign exchange losses resulting from reduced agricultural exports and increased food imports.⁴⁵

Prospects for implementation

In this era of economic narcissism on the part of the world's industrialised countries, to advocate the reforms suggested in this paper will be regarded by many as quixotic. Governments, we have frequently been reminded, will pursue reforms in North-South relations only when they perceive it to be in their interests either directly—because such reforms will give rise to mutual benefits—or indirectly in that reform may be perceived to be necessary to preserve the legitimacy of existing patterns of hegemony.⁴⁶ Critics of reports such as those of the Brandt Commission have insisted that mutual interest in reform has frequently been overestimated by its proponents. Exhortations to do the right thing have seldom brought the desired action. Least developed countries play such an insignificant role in the global economy that they have few assets with which to bargain. Middle-income countries, especially the NICs, not only have expanding markets which are becoming increasingly important for OECD exports, but also debt burdens which provide them with some leverage in international economic negotiations. While it has been argued that weakness can

⁴⁴ Ravenhill, 'What is to be done for Third World commodity exporters', *op. cit.*

⁴⁵ Ravenhill, 'Africa's continuing crises', *op. cit.*

⁴⁶ On the latter see Robert W Cox, 'The crisis of world order and the problem of international organisation in the 1980s', *International Journal* (35) Spring 1980.

sometimes be an asset in international negotiations in that it enables countries to claim that they cannot conceivably exploit any concessions to the extent that damage would be caused to the interests of the stronger parties, this has seldom been accepted by industrialised countries which are concerned with global levels of imports, regardless of source.⁴⁷ Probably the greatest bargaining asset enjoyed by the PMA is the claim that trade advantages will enable them to improve their exports such that they will make fewer aid demands on industrialised countries. Since aid is usually less costly in domestic political terms than trade concessions (which inevitably involve some degree of domestic adjustment), this argument again is unlikely to carry a great deal of weight.

The other principal problem which these proposed reforms would encounter is that meaningful trade advantages for the least developed can only be created at the expense of other developing countries. Other members of the Group of 77 have been willing to tolerate—if not always enthusiastically support—concessions for the least developed as long as these have been primarily of a token nature. Reforms along the lines suggested here will go beyond tokenism and are likely to prompt adverse reaction among those countries placed at a competitive disadvantage. None of the members of the Group of 77 perceive their economies as sufficiently buoyant that they can afford to relinquish the few concessions that they have been able to extract from the industrialised countries. There have been few favours ceded to the least developed in the negotiation of commodity agreements and orderly marketing arrangements. Simply because of their growing importance to OECD countries, the more advanced economies in the Group of 77 may be able to block measures which place them at a competitive disadvantage. Agreement would be more likely if the concessions to the least developed were accompanied by a package of interest to the newly industrialising countries, eg, a reduction in the non-tariff barriers on their more sophisticated exports.

Lack of negotiating resources and the absence of expertise make it unlikely that least developed countries will be able to exploit any future round of GATT talks. GATT, however, has acknowledged the legitimacy of taking special measures in favour of the least developed: this article has suggested how this might best be effected. Of the various

⁴⁷ John Ravenhill, 'Negotiating the Lomé Conventions: a little is preferable to nothing' in I William Zartman and John Sewell (eds), *North-South Negotiations*, New Brunswick NJ: Transaction, 1986.

proposals, the introduction of managed markets is least likely to be implemented. Graduation of the NICs from some GSP schemes is more likely—probably more for the reason of protecting domestic producers than helping the PMA, but the latter may gain some benefit. Further incremental improvements in the least developed countries' access to markets through GSP schemes may also be anticipated. Whether the crucial issue of security of future access will be addressed is more problematic; the least developed may benefit, however, from concessions negotiated by other developing countries. One can imagine, for instance, a possible trade-off of agreement on the liberalisation of trade in services in return for industrialised countries' acceptance of new safeguard arrangements in GATT.

Ultimately, trade preferences for the least developed can be justified in humanitarian terms. Appeals in international relations based on morality unfortunately have seldom succeeded in the absence of perception of mutual interest.

South Africa at the crossroads

A new Constitution

South Africa's racial conflict has a three-hundred-year history but recently the turmoil there has escalated into virtual civil war, mainly because of the white minority government's determination to implement a programme of political reform; one that is aimed at retaining white supremacy and has been rejected from the outset by the majority of the country's citizens.

The country's predominantly Afrikaner National Party ruled an all-white parliament since 1948. In 1977 the government announced that it was considering a new Constitution that would include other races in the central government. Two years later the Schlebusch Commission of Inquiry was set up to investigate the new constitutional proposals. The President's Council, a government-appointed conservative think-tank was appointed in 1980 and subsequently presented three reports on the proposals the majority of which were accepted by the ruling National Party in July 1983.

In May 1983 the Republic of South Africa Constitution Bill was presented to parliament and four months later—after potentially lengthy debate had been axed by the Minister of Constitutional Development and Planning, Mr Chris Heunis—the bill was ratified by Parliament in September 1983. The National Party held a referendum in November 1983, for white people only, in order to gauge support for the new Constitution. Despite almost universal black opposition, the white electorate gave the government's reform plan a two-to-one endorsement in the referendum. In terms of the new Constitution the country's Coloureds were allowed eighty-five representatives (House of Representatives) and the Indians forty-five (House of Delegates) in separate parliamentary chambers where each group had limited powers.¹ The white chamber (House of Assembly) has 178 members and of these about 122 are representatives of the ruling party while the

¹ Most South Africans who are not white prefer the homogenous term black, if the distinction has to be made. However, it has been necessary to deal with the government-defined gradation of racial disparity throughout this article. In this instance it becomes necessary to use largely despised government terms like Coloured or Indian which refer to South Africans of mixed racial descent or of Asian extraction, respectively.

official opposition, the Progressive Reform Party—mainly English-speaking South Africans—has twenty-seven members in the chamber. The remainder is made up of eighteen hard-line Conservatives, seven members of a right-wing English-speaking New Republican Party and one far-right member of the Herstigte Nasionale Party (literally translated 'The Re-established National Party').

The country's black people who make up 73.8 per cent of the total population of about 32 million have not been included in these constitutional plans, nor has the government hinted at a hidden agenda for incorporating blacks into the central government.² The Coloureds and Indians let in on the new tricameral deal, make up merely 6.7 and 2.7 per cent of the population respectively.

The new Constitution has given the State President, Pieter Willem Botha, widespread powers which include the ability to dissolve parliament or any of the three chambers at will.³ Within the parliamentary framework, opposition to the rigid rule of the National Party is therefore numerically impossible and potentially ineffective.

Against this scenario, sweeping extra-parliamentary opposition forces arose to oppose the implementation of the new deal. Mainly because it promised no fundamental change to South Africa's draconian and racist apartheid legislation, the African National Congress (ANC) launched its most serious bomb attack in the history of the organisation on 19 May 1983 in Pretoria, the country's administrative capital. Nineteen people were killed—both black and white—and 217 were injured.⁴

The United Democratic Front

At the beginning of 1983, after a call by the President of the World Alliance of Reformed Churches, Dr Allan Boesak, a steering

² Most black political organisations will accept nothing less than a universal franchise in a unitary state of South Africa, a concept that the majority of the country's whites find unacceptable. About 19 million black people live in ten 'homeland' areas, four of which have been granted 'independence' by the South African government. None of the 'independent' homelands have been given international diplomatic recognition.

³ In November 1985 the Minister of the Budget in the House of Delegates, Mr Ebrahim Abramjee, was dismissed by President Botha for hinting at the contents of an announcement the State President was due to make in connection with an offshore drilling project. See Norman West, 'Sacking was government "ploy"—Abramjee', *Sunday Times* (Johannesburg) 17 November 1985, p 2.

⁴ The ANC was banned in 1960, together with the smaller Pan-Africanist Congress (PAC) which is currently experiencing a resurgence of support from young black people who are impatient with the 'moderate' line of the ANC.

committee was set up to form a broad-based umbrella body which was later called the United Democratic Front (UDF). Initially, about 400 community-based organisations, trade unions, churches, youth bodies, women's groups, professional organisations, cultural bodies and various interest groups supported the coalition and on 20 August 1983 the UDF was formally launched in Cape Town.

It was the biggest single black political opposition grouping formed since the birth of the Congress Movements in the 1950s. Although the rise of the Black Consciousness Movement (BCM) in the early 1970s was historically very significant, BCM was organisationally and ideologically different from the UDF. The UDF's initial short-term aim was to coordinate opposition to the then new tricameral parliament and fight the government initiatives to continue dividing people along racial lines. Another UDF plan was to oppose proposed legislation which became known as the Koornhof Bills, after the cabinet minister responsible for Black Affairs at the time. These were laws aimed at tightening up the already severe control of the movement and settlement of black people.

One of the UDF's more important characteristics is that it cuts across racial, ethnic, cultural, economic and religious lines. There is widespread support for the organisation from the Christian churches and several prominent Muslim clerics have given the UDF their blessing. On the day before the launch of the Front in 1983, the Friday *khutba* in many mosques was devoted to informing Muslims about the UDF. Cape Town's Imam, Hassan Solomons, a UDF activist who went into hiding for several months last year because he was wanted by the security police, declared that there was 'nothing unIslamic in joining forces with the UDF . . . no Muslim can have anything to do with a system of government based on the division of people into coloured, Indian, white and black . . . all Muslims must categorically reject a system of government based on this. It is contrary to and in violation of the basic belief of Islam.'⁵

A unique feature of the kind of cooperation which black people have recently developed, through the UDF, is the joint funeral and other religious services held by Christians and Muslims. This is unparalleled in the country's history. The UDF and a host of other organisations captured the mood of the majority of black people. The Black

⁵ Imam Hassan Solomons, 'Not unIslamic to join the UDF', in a special edition of *UDF News* (Cape Town) University of Cape Town SRC Press, 1983, p. 2.

Consciousness Movement (BCM) that flourished in the 1970s, was popular but reeled under severe state repression after the uprisings of 1976. The BCM activities, however, were confined to certain sections of the populace and the movement did not have as much grassroots support as the UDF.

The historic uprisings in Soweto and elsewhere in the country during 1976 as well as the explosive schools boycotts of 1980 promoted a heightened political awareness throughout South Africa and set the stage for the UDF's success. Despite continued and heavy-handed state repression,⁶ grassroots opposition to the government grew in size and intensity after 1976. Community associations concerned with a wide range of issues—from small committees for neighbourhood affairs to national organisations—were established country-wide. In 1983 the UDF became the main link that finally provided cohesion for the country-wide groupings. The essential difference between this kind of political coalition and the consciousness-raising movements of the 1970s, is that the UDF mainly provides a platform for coordination and communication.⁷

During his keynote address at the launch of the UDF, Dr Boesak told an audience of about 6,000 people: 'In a sense the formation of the United Democratic Front both highlights and symbolises the crisis apartheid and its supporters have created for themselves. After a history of some 331 years of slavery, racial discrimination, dehumanisation and economic exploitation, what they expected were acceptance of the status quo, docility and subservience. Instead they are finding a people refusing to accept racial injustice and ready to face the challenges of the moment. Apartheid is a cancer in the body politic of the world, a scourge on our society and an everlasting shame to the church of Jesus Christ in the world and in this country. It exists only because of economic greed, cultural chauvinism, political oppression, maintained by both systemic and physical violence and a false sense of racial superiority'.⁸

⁶ In addition to the banning orders—these restrict movement and association—served on individuals, eighteen black organisations, including the South African Students' Organisation (SASO) and the Black People's Convention (BPC) as well as the multiracial Christian Institute were banned in October 1977. At the same time, two black newspapers and a black magazine were shut down by the government.

⁷ The Black Consciousness movements had a clear ideology and long-term political plan of action coupled with vigorous education and upliftment projects.

⁸ Dr Allan Boesak's speech at the launch of the UDF on 20 August 1983 in Cape Town.

A substantial measure of the UDF's popularity can be assigned to the fact that those who oppose the government sense that South Africa's rulers have lost their grip on the situation. People know that they have reached a turning point in the country's troubled history and at last it is possible to visualise the end of an unjust regime. Police and defence force action became progressively more repressive prior to and during the State of Emergency—declared in July 1985—but the majority of the people realised that behind this renewed show of physical force was a politically weakened government. For the first time since the National Party government came to power, black people spoke of freedom as an imminent reality rather than a remote goal.

After its launch the UDF became vigorously involved in black community affairs at every level. Almost immediately, harassment of its members began and the UDF's activities were subjected to bannings and the spread of anonymous disinformation and propaganda. In 1984, as part of its election campaign, the Coloured Labour Party—it now has a majority in the House of Representatives in the tricameral parliament—produced pamphlets purporting to be proof that the UDF had the backing of the ANC.⁹ Because the ANC and organisations sympathetic to its ideology have the backing of at least 50 per cent of urban blacks—according to a 1984 poll conducted by the Human Sciences Research Council—this claim is irrelevant in black society. However, because of lack of information and twenty-five years of banning, whites and a small band of ultra-conservative blacks have a distorted view of the ANC as a bloodthirsty terrorist organisation. In the view of most of the white electorate, government clamp-downs are therefore justified if there is a UDF/ANC link. The UDF's consistent response to much-vaunted claims in this connection has been that because of the nature and composition of the organisation there were bound to be ANC supporters or sympathisers within its ranks. Officially, it claims no direct links with the banned organisation and has adopted a non-violent stance while expressing an appreciation of the fact that the ANC was forced to resort to acts of violence only after it was exiled. Most black people see the system of apartheid as the fundamental violence against the oppressed and any aggression on the part of black people as mere retaliation. The views of the Rt Reverend Desmond Tutu, the Anglican Bishop of Johannesburg, are representative of an increasing number of black moderates. He says:

⁹ 'L P says ANC backed UDF', *Cape Times* (Cape Town) 1 August 1984, p 2.

Apartheid is violent. I oppose violence but I accept there may come a time, because of an unjust system, when all else has failed, that the church might say to its members it is justifiable to fight against an unjust system. Which is the lesser evil? The evil system or the fighting against it, as for example the fight against Nazism?¹⁰

The National Forum

In June 1983 a coalition smaller than the UDF was initiated by the Azanian People's Organisation (Azapo) and called the National Forum (NF).¹¹ This is also essentially an umbrella organisation which, like the UDF, facilitates the planning of mass action or political opposition and acts as a vehicle for debate and consultation.

While the UDF is the most popular of the resistance movements, there are organisations outside its rank—mainly several trade unions and Azapo—who wage the struggle for the liberation of the country's black people on a scale that is equally intense.

Unlike the multi-racial UDF, the 200 affiliates of the NF are exclusively black, although the prominent NF academic and ex-Robben Island political prisoner, Dr Neville Alexander, has spoken out forcefully against the automatic exclusion of whites. He said that he believes that the leadership of organisations engaged in the struggle for liberation should remain in the hands of the black working class but that whites who were committed to the ideals of freedom should not be excluded from the rank and file.¹² At the two-day NF launch in June 1983, about 800 delegates drew up the Manifesto of the Azanian People. On the other hand, UDF-affiliated organisations subscribe to the Freedom Charter drawn up in 1955 by the Congress Alliance of which the ANC was a member. The differences between these two groupings, the NF and UDF, are therefore seen primarily as the difference between Charterists and black consciousness groupings. Bishop Desmond Tutu is a member of the National Forum Committee (NFC) and like many other black leaders is at the same time well-disposed towards and active in the UDF. However, the government, the white press and *agents provocateurs* have done much to harp on the differences between the NF and the UDF.

¹⁰ Carol Lazar, 'Man on the run', *Weekend Argus* (Cape Town) 16 November 1985, p 15

¹¹ Azania is what the majority of the people see as a name for the future South Africa.

¹² One of the affiliates of the biggest trade union grouping, the Council of Unions of South Africa (CUSA) which claims 249,000 members, admitted two white members in 1984. CUSA's general secretary Mr Piroshaw Camay, stated in the *Rand Daily Mail* (Johannesburg) 26 July 1984, that this did not mean a change in their policy of reserving leadership posts for blacks.

After the formation of the UDF and the NF, the politicisation of the masses escalated. Mass meetings, political publications and coordinated grassroots activity helped people to acquire increasingly more sophisticated political analyses of the South African situation. The problems of high rent, low wages, 'gutter education', rising unemployment, were no longer merely the concern of special interest groups—for example, student bodies or trade unions—but were seen in proper perspective. People became much more aware of the total social, economic and political reality that shaped their daily lives. This expanded awareness coupled with a declining economic situation, meant that people were more easily mobilised into political action and increasingly prepared to voice their anger at the system of apartheid. Black people could now clearly link their powerlessness and problems to their non-participation in the political system.

Troubled elections

The first display of the effectiveness of the growing black opposition to government's attempts to press ahead with unacceptable and cosmetic reforms, was the dismal failure of the Coloured and Indian elections for the tricameral parliament. In the run-up to the elections in August 1983, both NF and UDF groups held mass rallies country-wide. On the weekend before the elections about 20,000 people attended rallies in protest—in all the country's main centres—and also to mark the UDF's first anniversary.¹³ By comparison, the electioneering parties confined their meetings mainly to rural and peri-urban areas. Gatherings held in the cities were badly attended and often disrupted by anti-election groups. Tensions mounted on all sides and the day before the Coloured elections on 22 August 1984, police clamped down on the UDF, detaining thirty-five of the organisation's leaders and supporters.¹⁴

The events surrounding the election eloquently emphasised black resentment against the new Constitution. In July 1984 the Minister of Constitutional Development announced in parliament that 60.5 per cent of all voters had registered (failure to register is illegal in South Africa). All the major black political groupings had called for a boycott of the elections, including the ANC. There were numerous incidents of

¹³ Carole Cooper, Jennifer Shindler, Colleen McCaul, Frances Potter and Melanie Cullum in the South African Institute of Race Relations' *1984 Annual Survey*, Johannesburg: SAIRR, 1985, p. 18.

¹⁴ 'UDF arrests condemned' and 'UDF detainees named', *Cape Times*, 22 August 1984.

violence during the election campaigns, as boycotters clashed with party supporters and candidates. There were at least seven petrol bomb attacks on the homes of Coloured and Indian candidates.¹⁵ On 22 August 1984, the day of the Coloured elections, 152 people (many of whom were students) were arrested during election-related incidents. About 630,000 Coloured students boycotted classes in protest.¹⁶ The following week, when the election for the House of Delegates was held, similar disturbances occurred and in one incident in the Transvaal's Indian suburb of Lenasia, police—throughout the day they kept a high profile at polling stations—were petrol-bombed and stoned.

The official percentage poll for the Coloured elections was 30.9 per cent, with the Labour Party taking seventy-five seats.¹⁷ The South African Institute of Race Relations (SAIRR) which monitors a wide range of political and apartheid-related events in the country, estimated that the real poll was 18.1 per cent when the 'eligible' rather than registered voters were taken into account.¹⁸ What is more important is that the majority of the people classified officially as Coloured live in the Cape Peninsula where an 11.1 per cent poll (the lowest in the country) was recorded.¹⁹ In the Indian elections, 15.2 per cent of the potential voters went to the polls, while the official figure based on those who registered is 20.9 per cent.²⁰

Despite this clear rejection of the new ideal, the government went ahead with its constitutional reform and in January 1985 the first sitting of the tricameral parliament was hailed as the start of a new era. In white society the 1984 scrapping of the laws which prevented inter-racial sex and marriage was seen as the initial direct influence of having Coloureds and Indians in the central government. On the other hand, most black people saw it as a move to gain credibility for the new parliamentarians. More relevant is the fact that removing the legislation affected very few people country-wide and the Group Areas Act—a law

¹⁵ In *The Star* (Johannesburg) 4 February 1984.

¹⁶ *The Star*, 10 November 1984.

¹⁷ The Labour Party is an ultra-conservative Coloured political grouping. Its leadership has stated that its aim in joining the tricameral parliament is to 'dismantle apartheid'. They have frequently attacked the United Democratic Front. The Labour Party leader, the Rev Allen Hendrickse, is a minister without portfolio in President Pieter Botha's government. Despite the insurmountable border conflicts it would create, Hendrickse's view of the future is a federal system where 'racist' and 'non-racist' states can co-exist. See *Annual Survey*, *op. cit.*, p. 29.

¹⁸ *Annual survey*, *op. cit.*, pp 127–8.

¹⁹ South Africa has 2,830,301 people registered as Coloured and this constitutes 8.7 per cent of the population. See the government's Central Statistical Services *News Release*, 15 August 1984, p. 11.

²⁰ *Annual Survey*, *op. cit.*, p. 128.

that confines race groups to certain government-designated residential areas—still remains, causing a paradoxical situation for those black and white couples who do marry.

The underlying causes of the unrest

Since the government made the details of its political reform known, there were repeated warnings from black community leaders that the exclusion of blacks and failure to consult the majority of the country's people about the new deal would lead to protest and violence. These warnings were ignored and branded as the utterings of desperate radicals who could not afford to allow successful evolutionary change because their aim was to destabilise the society and bring about violent revolution. During the last part of 1984 and for the whole of the following year South Africa experienced country-wide unrest that was the worst since the disturbances of 1976 and resulted in the State President declaring a State of Emergency in July 1985. The reasons for the unrest are varied but the heightened political awareness of black people coupled with a number of factors discussed below caused these civil disturbances to be the worst in South Africa's history.

Black exclusion from politics

The exclusion of black people from real political power is by far the most important precipitating factor. In a remarkably naive approach, most white South Africans, even informed liberals, tend to see poor socio-economic conditions as the primary reasons for black dissatisfaction. Without discounting bread-and-butter issues, this is an attitude that tends to minimise the deeply-rooted political anger, articulated often and in so many ways. The irresponsible government propaganda which portrays largely docile and unsophisticated black masses being led or intimidated by a few radical extremists, is widely believed among whites and the Western world. However, this response to the suffering of South Africa's oppressed has led to despair in moderate black circles where people are torn between white intransigence and impatient radicals who believe a violent overthrow of the system is the only answer to the country's problems. And, indeed, the government has done little to win the support of the moderates and to defuse the arguments of black extremists. A report published by the President's Council in June 1984 stated that the inclusion of blacks in the

central parliament would result in 'group domination and conflict'. The council's report advocated 'controlled evolutionary reform'.²¹

Since then there have been several indications of the government's inability to resolve the question of full black participation in the central decisionmaking process. Addressing a plenary session of the President's Council in November 1985, State President Pieter Botha asked the Council to consider ways to include black people in its membership. The Council is purely an advisory body and has been rejected by the majority of black people from the start. The move was immediately rejected by most progressive black organisations including the UDF, NF, and Azapo. During his speech to the plenary session, Botha reiterated his principle of 'a united South African people with citizenship and franchise for all within the structures chosen for South Africans by South Africans'.²² The crux of the matter is that the government has a history of choosing or approving the blacks who will help them decide on these 'structures'. The main reason why the President's reform plan is in tatters is because of his government's inability to obtain the cooperation of most black people and there is no likelihood that, in the immediate future, they will enlist the participation of the popular black organisations. The majority of people regard the reform initiatives as neither 'a strategy nor a solution but as part of the programme of the oppressor'.²³

After the President's request to the Council to find ways of including blacks, political analysts forecast that the 1986 parliamentary session would see the scrapping of certain racist laws and discussion on a new federal constitution. By late 1985, it was clear that at the top of the agenda would be the question of black citizenship. The government announced that it would abandon its original plan arbitrarily to make most black people citizens of the ten black homelands (Transkei, Bophuthatswana, Ciskei, Venda, Lebowa, Kwazulu, Qwaqwa, KwaNdebele, KwaNtse and Gazankulu)—these cover about 13 per cent of the country—and would automatically restore South African citizenship to those people who had been victims of this policy. It was planned that people who lived in the four homelands that had been given South African-style 'independence' (Transkei, 1976;

²¹ Final Report of the Constitutional Committee of the President's Council on the Adaptation of the Constitutional Structures in South Africa PC/4.

²³ Nokgethi Motlhabi, *The Theory and Practice of Black Resistance to Apartheid*, Johannesburg: Skotavill, 1984, p. 269.

Bophuthatswana, 1977; Venda, 1979; Ciskei, 1981) would be able to hold some form of 'associate' South African citizenship. The government promised in several announcements to give freehold rights to blacks who had, up to 1984, been allowed leasehold rights only on property and eventually to scrap influx control. According to Professor Michael Savage of the University of Cape Town, more than 17 million black people have either been arrested or tried in court for contravening influx control regulations since the early 1900s. In a paper he submitted to a 1984 commission of inquiry into poverty, he claimed a daily average of 1,703 arrests in the 1960s and 580 in 1981-2.²⁴

In addition to all this the government plans to implement a new Constitution to implement a federation of states with the already 'independent' homelands being given 'confederate' status. Quoting senior government sources, the political editor of a Johannesburg newspaper predicted that 'the principle of representation by racial groupings in the political process could remain inviolable'.²⁵ For this reason, as well as the fact that it is unlikely that the government will allow the real black leaders—most of whom are imprisoned, banned or in exile—to take part in drawing up the new Constitution, the federation plan will almost certainly not get widespread support. The UDF, ANC, and Azapo have insisted on nothing short of universal franchise in a unitary state.

Dissatisfaction with the education system

Dissatisfaction with a poor education system that has seen scant improvement even since 1976 is a second major focus of discontent. Nineteen seventy-six was a year marked by serious civil disturbances and boycotts resulting from, firstly, the insistence of the authorities on teaching Afrikaans to black pupils and, secondly, the disparity in the money spent on education for the different races. According to the latest available figures, the government spends about R170 on each African child annually and R1,500 on every white child. This figure excludes capital expenditure and the comparative figures for Coloured and Indian children are R501 and R905 respectively.²⁶ For every

²⁴ *Rand Daily Mail*, 18 April 1984.

²⁵ Brian Pottinger, 'P W set to move at last', *Sunday Times*, 17 November 1985.

²⁶ These figures reflect the 1983/84 Education Budget and the increased expenditure over the previous year for every African, Coloured, Indian and white pupil was 13.8 per cent; 0.2 per cent; 27.3 per cent and 24.8 per cent respectively. See *Annual Survey*, *op. cit.*, p 648.

African teacher there are 40.7 pupils while every 18.9 white children have a teacher.²⁷ In addition to these important differences, the literacy rate highlights the inferiority as well as inaccessibility of black education. Linda Wedepohl of the University of Cape Town's Centre for Extra-Mural Studies has done a study which estimates that as many as nine million South Africans could be illiterate. The figures—based on the most recent (1980) population census—show that 33 per cent of black people over fifteen years are unable to read or write while only 0.72 per cent of whites in the same age group are illiterate. Coloureds and Indians fall in between with 15.51 per cent and 7.59 per cent respectively.²⁸

Since 1976 the schools issue, and what has been branded as 'gutter education', has played a major role in the unrest in South Africa. While the broader issue sparking confrontation has been the inferior quality of black education, a more specific demand has been for democratically elected student representative councils (SRCs). Students wanted to draw up their own constitutions for the SRCs and affiliate them to the main student organisations: the Congress of South African Students (COSAS), the Azanian Students Movement (AZASM) or the Azanian Students Organisation (AZASO). While the education authorities agreed with the need for SRCs they refused to allow students the freedom to draw up their constitutions. In a typically high-handed fashion, the black education department drafted a constitution for the SRCs according to which they were obliged to concern themselves only with educational matters, relating to the set syllabus. The department also refused permission for the SRCs to affiliate to COSAS, AZASM or AZASO because these were not recognised by the department.²⁹ The South African authorities are clearly incapable of compromise even on simple issues and repeatedly deal with significant black protest in a manner that offers little hope for resolving conflict. On 28 August 1985, COSAS was banned in terms of South African security legislation that empowers the Minister of Law and Order to ban an organisation if he considers it represents a threat to security.³⁰

²⁷ Central Statistical Services Department, 'Educational Statistics 1983 and 1984 Summary', *News Release*, 1984, p 23.

²⁸ *Annual Survey*, *op. cit.*, p 562.

²⁹ See *Rand Daily Mail*, 15 October 1984. Mr Job Schoeman, Chief Public Relations Officer for the Department of Black Education and Training, was quoted as saying that they would not recognise black student bodies and would not allow pupils to dictate to them.

³⁰ By the time COSAS was banned the Detainees' Parents Support Committee (DPSC) estimated that about 500 of its members had been detained by the police under the State of Emergency regulations. See Clare Harper, 'Wide, angry reaction to COSAS banning', *Cape Times*, 29

Another important aspect, often overlooked when examining the problems of black education, is the subject of the twenty-year age limit at high schools. Hundreds of students have been refused re-admission to high schools because they were older than twenty years. Judging by the fact that only 50.13 per cent of black matriculants—Standard 10 or twelfth school year—passed their examinations at the end of 1984 it can be seen that a fair proportion of students seek re-admission annually at high schools.³¹ For these and other reasons—including the fact that black teachers are generally not well-qualified or equipped to ensure that students finish their schooling in the minimum time period—students regard an age limit of twenty years as punishing them for being the products of a system created by apartheid.³² But little was done by the government to redress the main student grievances which are the same nation-wide: restrictions on the SRCs, excessive corporal punishment, sexual harassment of schoolgirls, the twenty-year age limit, the fact that not all books are free as in white schools, and unqualified teachers. These are just the more urgent demands apart from which there are issues, such as overcrowded schools, inadequate buildings and minimal sporting facilities. A report released in October 1985 by the Western Cape Teachers Union (WECTU) states that in South African society 'key economic issues are not made on the basis of human needs but on the desire for profit for the wealthy few'. The report adds that schools contribute to the maintenance of this 'stratified labour force for the capitalist system'. 'The gross inequalities in our education system and such alarming failure rates are not the result of some unfortunate historical accident but are there and remain there by design' . . . ends the WECTU report.³³

August 1983. After the banning of several organisations in 1977 there was a lull in student activities. In 1978 COSAS was formed and after affiliating to the UDF in 1983, it became very active at high schools. COSAS coordinated the school boycotts and organised protest action. Its stated aims included 'normalising' relationships between teachers and students; creating a spirit of trust, responsibility and creative companionship and striving for a dynamic, free and compulsory education. See Sipho Ngcobo, 'How COSAS rose from obscurity to enemy No. 1', *Business Day* (Johannesburg) 30 August 1985.

³¹ Figure supplied by the Department of Black Education and Training in October 1985.

³² See Department of Education and Training Annual Report 1983 RP65/1983. The report states that the highest proportion of teachers in black schools 44.5 per cent have a junior secondary education, ie standard eight, or ten years of schooling. A further 15.5 per cent have a primary teaching certificate, 6.9 per cent have a senior teaching certificate and 2.1 per cent have a university degree.

³³ Yazeed Fakier, 'Teachers cannot be neutral, says WECTU', *Cape Times*, 15 October 1985

The impact of unemployment

Towards the end of last year the escalating unemployment was conservatively estimated at 1.5 million, slightly more than 10 per cent of the workforce, but more radical estimates say that up to 4 million people could be jobless. An accurate figure is impossible to determine because the government keeps records for whites, Coloureds and Indians only, among whom unemployment has risen by 131 per cent to 69,534 for the year ending August 1985. Unlike the people in the other race categories, blacks do not receive unemployment benefits. Professor Wolfgang Thomas of the University of the Western Cape estimated late last year that each month about 100,000 people were losing their jobs.³⁴

South Africa's high inflation rate, running at the highest level since the end of World War II, has resulted in astronomical price increases on consumer goods and one of the results is that the already alarming level of malnutrition is on the increase.³⁵ According to Dr A R P Walker, head of the Human Biochemistry Unit at the South African Institute for Medical Research, nutritional deficiency was causing a high incidence of sickness and death among the poor, while for the affluent and mostly white sector of the society health problems related to nutritional excess such as heart disease, dental caries, obesity, hypertension, diabetes and breast and colon cancer.³⁶ The South African Red Cross society has estimated that about three million children in the country suffered from malnutrition. Professor John Hansen of the Department of Paediatrics and Child Health at the University of the Witwatersrand, claims that about a third of all black children under fourteen years are underweight and have stunted growth due to poor nutrition.³⁷

A violent culmination

On all fronts in the black townships pressure conducive to insurrection and violence built up from the start of 1984 and exploded into the worst violence the country had seen since the 1976 uprisings. Denied the sympathetic ear of the government, angry students, parents battling

³⁴ Lesley Lambert, 'Jobless rate up 131% in 12 months', *Business Day*, November 1985, p. 1.

³⁵ The country's 16.6 per cent annual inflation rate is the highest since World War II and some retailers have predicted that it could rise to 20 per cent in 1986. See Stephen Cranston, 'Retailers predict rampant inflation', *Business Day*, 13 November 1985.

³⁶ *Annual Survey*, *op. cit.*, p. 723.

³⁷ J Hansen, 'Food and nutrition policy with relation to poverty: the child malnutrition problem in South Africa', Second Carnegie Inquiry into Poverty and Development in Southern Africa, April 1984 Cape Town.

against a rising cost of living, and workers all joined forces within community organisations to protest against racial and economic injustices. As it became increasingly intolerable for black people to bear the brunt of apartheid, there were strikes, clashes with police and violence against black government-employed workers or those deemed to be 'collaborating' with the oppressive system.

In an area of the Transvaal known as the Vaal Triangle, people observed a one-day stay-away in September 1984, as a protest against unaffordably high rents. The average rent in this area is higher than the rents black people pay in other parts of South Africa. Although for black people Johannesburg has the highest cost of living, the rents in this city are about R10 (about £2.50 sterling), cheaper than rents in the Vaal triangle.³⁸ Within a few days of the strike, thirty-one township dwellers were killed. Some of the dead were blacks who served on the government-created village boards (community councils) and others were killed in clashes with the security forces.³⁹ Black violence against fellow blacks became a feature of the unrest in South Africa as state repression increased—blacks became more angry at those in their midst whom they considered to be willing agents of a system responsible for so much suffering.

Several days after the Vaal Triangle protest ended in death and property damage of about R30 million (about £7.5 million), rent and electricity increases were shelved for a year.⁴⁰ But this concession was overshadowed by events weeks later when 500 persons were arrested for attending a funeral that the local magistrate had banned.⁴¹ This heavy-handed action and disregard for the rights of black people, even to bury their dead, typifies the response of the South African authorities to even minor demands from the black community, where there is a growing credibility gap between the state's reformist utterances and strong-arm tactics on township streets.

Student unrest was sparked off almost as soon as black schools

³⁸ J F Potgieter, 'The household subsistence level in the major urban centres of the Republic of South Africa', September 1984, Institute for Planning Research, University of Port Elizabeth. According to information supplied by Market Research Africa, the average monthly household income for a black family was R273 (about £68 sterling in 1984). At the same time, whites earned a monthly average of R1,834 and for Coloureds the figure was R624. See *Annual Survey, op. cit.*, p 241.

opened in 1984. By the end of that year about 22,000 high-school pupils were boycotting classes.⁴² Failing to deal with the causes of the township disturbances, and in keeping with their usual stance of confrontation, defence force troops were deployed to restore 'order' in three Transvaal townships in October 1984. Township residents saw the presence of the troops in their neighbourhoods as a declaration of civil war on them and their children. The South African spiral of apartheid's legalised violence, violent reaction and repressive counter-action seems never-ending. In January 1985, a government survey into the unrest in the Vaal Triangle townships came to the remarkable conclusion that dissatisfaction with the education system had not played any part in the unrest of the previous year. The survey report cited possible black municipal maladministration and the fact that people did not understand the working of the new black local authorities properly, as the reasons for the rioting.⁴³ The survey did not take into account the fact that far from a lack of understanding, blacks rejected government-created local authorities because people clearly understood how little real power the community councils could exercise within the framework of apartheid. In the Eastern Cape an entire village council resigned because of community pressure and the councillors' inability to improve conditions in their township. The former community councillors said they were not given a hearing by the authorities and were seen as 'civil servants who helped the government in implementing its apartheid policy'.⁴⁴

Sharpeville re-lived

No single incident in the country's recent history demonstrates more clearly the brutal intransigence of white authority than the police killing of seventeen mourners on their way to a funeral near Uitenhage in the Eastern Cape. The funeral killings took place on the anniversary of Sharpeville (1960) when sixty-nine people taking part in a peaceful defiance campaign were shot and killed. On 21 March 1985, as South Africans were commemorating the twenty-fifth anniversary of the Sharpeville dead, police fired on a peaceful crowd of mourners in the Eastern Cape. The people were walking from one township to another to bury an unrest victim. Subsequently it was found, as in the case of the

⁴² *Annual Survey, op. cit.*, p xx.

⁴³ 'Education not cause of riots', *Cape Times*, 3 January 1985.

⁴⁴ 'Entire village council resigns', *Cape Times*, 7 January 1985.

killings of twenty-five years ago, that most of the black victims were shot in their backs.⁴⁵

In the wake of the incident and acting on information given by senior personnel in his department, the Minister of Law and Order, Louis Le Grange, later misinformed parliament on the killings. He said that the crowd of mourners were armed with 'stones, sticks, petrol bombs and bricks' and that they were confronted by a police unit and told that their march was illegal. The minister claimed that the commanding officer fired a warning shot and the crowd allegedly retaliated by surrounding the police and throwing stones, sticks and petrol bombs. According to the minister's account—subsequently rejected by an official inquiry—the police then fired in self-defence.⁴⁶

A government-appointed commission of inquiry, headed by Justice Donald Kannemeyer, found that the unnecessary banning of a funeral on that day and ill-equipped police were mainly responsible for the incident. The judge found that several allegations that Le Grange had made in parliament were untrue, including the fact that the police were surrounded and stoned as well as petrol-bombed. The Kannemeyer Report, tabled in parliament in June 1985, dismissed police claims that they had found traces of exploded petrol bombs and an unexploded bomb with fingerprints.⁴⁷ The Kannemeyer Report's most damning indictment states: 'Had the holding of the funeral not unnecessarily been prohibited on doubtful grounds, there can be little doubt that the procession would have passed through Uitenhage without incident'. The Report stated that thirty-five of the forty-seven killed had been shot in the back.⁴⁸

Emergency

As the country-wide disturbances showed no signs of abating, the government made their first move towards the declaration of the State of Emergency and banned the meetings of sixty-four black

⁴⁵ In 1960 the ANC called for a peaceful protest against the pass laws. In a defiance campaign organised to start on 21 March 1960, black people were told to leave the pass books—blacks are still legally compelled to carry these books at all times—at home and offer themselves up for arrest. In Sharpeville, near Vereeniging in the Transvaal, the police opened fire on a peaceful group of black people, killing sixty-nine and injuring 178 others. A State of Emergency was declared and 1,900 people were detained or arrested. See Benjamin Pogrand, 'That sunny day in Sharpeville', *Rand Daily Mail*, 21 March 1985.

⁴⁶ '17 shot dead', *Cape Times*, 22 March 1985.

⁴⁷ 'Police exaggerated evidence of crowd's weapons', *Cape Times*, 12 June 1985.

⁴⁸ 'Funeral banning and ill-equipped police blamed for deaths', *Cape Times*, 12 June 1985.

organisations in thirty magisterial districts in June 1985.⁴⁹ However, the violence was taking on added dimensions daily and one sinister aspect to emerge was the increasing attacks, often fatal, on political activists. Many of these crimes were never solved by the police. In one particularly horrific killing, four UDF leaders in the Eastern Cape, Matthew Goniwe, Ford Calata, Sparrow Mkhonto and Siceio Mhlawuli were found stabbed and burnt to death. The car in which they were travelling on their way home from a meeting was also burnt out. Despite a R40,000 reward offer—most of it put up by the UDF—the police have not made any headway in their investigations. Unrest spread to the Western Cape when pupils boycotted schools to commemorate the deaths of the four men.⁵⁰

Amid glaring international publicity on events in South Africa, the government declared a State of Emergency in thirty-six magisterial districts on 21 July 1985. By November the political violence death-rate had more than doubled. Professor Alf Stafler of the University of the Witwatersrand ascribed the rise in the number of deaths to the increasing willingness of both sides to use force.⁵¹ In the year ending October 1985, about 800 people died as a result of political violence, 4,000 were injured and there were about 19,000 riot-related arrests.⁵² Figures compiled by the South African Institute of Race Relations show that there had been only 175 unrest deaths in 1984.⁵³

The Emergency declaration gave the already notorious South African police even wider powers and President Botha claimed that these were aimed at restoring peace in the troubled townships. However, initial state action proved that the Emergency was really aimed at silencing every dissenting voice in the South African political arena. In the first four months the police detained about 5,000 people under the emergency regulations. Under the 'normal' security legislation about 100 people were detained monthly since the beginning

⁴⁹ 'Govt bans meetings of 64 groups', *Cape Times*, 29 June 1985.

⁵⁰ An independent pathologist, appointed by the families of the four murdered UDF leaders, found they had died of multiple stab wounds—one had been shot in the head as well. The bodies were burned afterwards. See Chris Whitfield, 'UDF deaths horror', *Sunday Tribune* (Durban) 6 August 1985. Despite a R42,000 (about £10,500 sterling) reward from the UDF, academics and the police—they contributed R1,000—no headway has been made in police investigations.

⁵¹ Arlend Getz, 'Death toll has more than doubled since State of Emergency was declared', *Sunday Tribune*, 15 November 1985.

⁵³ *Sunday Tribune*, 15 November 1985.

of 1985. The majority of the detainees were students, teachers and community workers.⁵⁴

In the black townships the presence of defence force troops and the declaration of the State of Emergency were seen as the moves of a government out of control. To no avail community organisations warned the government that detaining community leaders would result in lawless elements stepping into the vacuum and lead to even more violence. A University of Cape Town report found that 83 per cent of the detainees were tortured.⁵⁵

When visiting South Africa in September, the historian and writer, Robin Hallett, stated that the police were prompting anarchy by their indiscriminate use of violence. 'It is a terrible indictment to have to make, but as a historian I find it impossible to avoid the conclusion that in their unrestrained use of violent tactics some sections of the police have in fact contributed to the sense of growing anarchy.'⁵⁶ What has become known as the 'Trojan Horse' incident, bears testament to Hallett's observations. On 15 October, police hid in packing-cases on the back of a civilian truck and as the vehicle approached a group of young protesters in a Coloured suburb of Cape Town, they opened fire with shotguns, killing three and wounding fifteen others.⁵⁷ The incident was given prime coverage on television screens world-wide and a few weeks later drastic curbs were placed on the domestic press and television and especially the foreign media operating in South Africa. No television reporting or photographing of unrest was to be allowed and newspaper reports were subject to even stricter state control. Under comparatively 'normal' circumstances the South African press is severely censored; the State of Emergency regulations introduced even more curbs and the increased news black-outs, introduced in November, made sure that a semblance of peace, at least, reigned in the homes of the white electorate, whose racially exclusive residential areas were far removed from the black townships. This drastic censorship was unashamedly justified on international television by the Deputy Minister of Information, Louis Nel, on the evidence of a letter to the editor of the *Daily Telegraph* (London). The published letter was purportedly from a holidaymaker who had seen foreign television crews inciting black

⁵⁴ 'Apartheid barometer', *Weekly Mail*, 1(23) 15-21 November 1985.

children to riot in South Africa. When the letter was shown to be a fake, Vel then cited several accounts where foreign television crews had allegedly incited riots. None of the alleged incidents were substantiated by evidence.

Future action

The disheartening aspect of charting events in South Africa is the historical inability of the government to understand that black people do not want and will not live with apartheid and any of its forms—whether it is a tricameral parliament where a handful of blacks play the politics of collaboration or the confederal dream of the National Party where undoubtedly whites will rule whites in the rich white areas and blacks will have autonomy in their barren homelands and ghettos. At this point in the country's history the government and the few blacks who think their political salvation is dependent on the white Afrikaner minority are headed on a course of action that does not offer a peaceful alternative to the country's problems. If the government or its supporters were genuinely working towards peace, a round table convention—devoid of senseless political rhetoric about the ANC foregoing violence—would have been on their agenda. Instead, the architect of the National Party's reform plans, Chris Heunis, Minister of Constitutional Development and Planning, says that they are holding secret discussions with the credible black leadership.⁵⁸ If this were indeed a move to be viewed optimistically, it is puzzling why one of the most popular black leaders, the Bishop of Johannesburg, the Rt Reverend Desmond Tutu, was refused an opportunity to talk with the State President.⁵⁹ Black people believe that the South African government has moved about as far as it will willingly go along the road to real political reform and any further moves on the part of the state will be the result of increased pressure from both home and abroad.⁶⁰

The most important aspect of fundamental political change as

⁵⁸ Paul Bell, 'Silence! reform at work', *Business Day*, 19 November 1985.

⁵⁹ At the start of the emergency Bishop Tutu requested an appointment to see the State President so that they could discuss the serious unrest in the country. However, the President refused the opportunity. See Sophie Tema, 'Play games while SA burns', *Cape Times*, 30 July 1985.

⁶⁰ If South Africa's political policy were separate but equal opportunities and facilities for all races, as the country's rulers have always claimed, the international outcry would not be that vigorous. The unashamed inequality is why South Africa 'runs like a sewer through the conscience of the world', as one noted Afrikaans literary figure writes. See Andre Brink, 'Some aspects of culture and apartheid' in Peter Randall (ed), *Anatomy of Apartheid*, Johannesburg Sprocas, 1970, p 40.

opposed to the government's attempts thus far to disguise apartheid, is that it will not be accepted unless the government thrashes out a model for a future South Africa with black leadership that does have credibility. As one black writer notes: 'Change has to be negotiated, not imposed by the guilty party.'⁶¹ This means releasing the jailed ANC leader, Nelson Mandela, as well as all other political prisoners or detainees, allowing the exiles to return home and lifting the bans on individuals and popular organisations. In the present situation the white minority government has given clear indications that this is highly unlikely.

Exploring the viable alternatives, Mokgethi Motlhabi assesses the effects and limitations of guerrilla warfare as opposed to peaceful solutions. Motlhabi explores the role of the churches—historically, most white Christians have offered little moral resistance to apartheid—as well as the part to be played by the black trade unions and political organisations. According to him, black South Africans will ultimately be their own liberators with little assistance from Western countries or the UN, although he does concede that sanctions could have a positive effect. He concludes that:

It seems probable that change in South Africa will ultimately depend on the maturity of 'Black Power'; if this is understood as a direct, lasting challenge to the system by Blacks after summoning their strength and uniting in unrelenting action against it for better or for worse. All Black South Africans hope that this will come about peacefully. At this stage, however, very few Blacks have categorically ruled out of consideration other solutions which may be less peaceful.⁶²

⁶² *ibid.*

Interest group politics in the Third World

Although it is possible to characterise theoretical developments in the study of interest group politics during recent years as 'the decade of corporatism', it now appears that this decade has come to an end. Pluralism, temporarily supplanted but never extinguished, has been 'rediscovered' and found to be more resilient and more capable of rejuvenation than expected. In political analysis as in political life it seems that both paradigms are bound to coexist in changing proportions and to interact in various ways.¹

By now several writers, myself included, have argued that the concepts of pluralism and corporatism are most useful when not regarded as diametrically opposed ideal types or as coherent moulds shaping whole political systems. Instead it is theoretically more elegant and empirically more accurate to conceptualise them as alternative principles or modes of representation which can emerge and develop simultaneously in the same political system, trading positions of relative predominance in successive historical periods, across various socio-economic sectors, and even in different issue areas or geographic regions.²

Such an approach has several important implications for the comparative analysis of interest politics. It allows us to capture the persistently heterogeneous nature of many systems of interest

¹ For definitions of corporatism and pluralism see Philippe C Schmitter, 'Still the century of corporatism?', *Review of Politics*, 36(1) January 1974, pp 85-131: 'Corporatism can be defined as a system of interest representation in which the constituent units are organized into a limited number of singular, compulsory, non-competitive, hierarchically ordered and functionally differentiated categories, recognized or licensed (if not created) by the state and granted a deliberate representational monopoly within their respective categories in exchange for observing certain controls on their selection of leaders and articulation of demands and supports.' 'Pluralism can be defined as a system of interest representation in which the constituent units are organized into an unspecific number of multiple, voluntary, competitive, non-hierarchically ordered and self-determined (as to type or scope of interest) categories which are not specially licensed, recognized, subsidized, created or otherwise controlled in leadership selection or interest articulation by the state and which do not exercise a monopoly of representational activity within their respective categories.'

² Similar points are made by many of the contributors to two recent volumes on Western Europe. Gerhard Lehmbruch and Philippe C Schmitter (eds), *Patterns of Corporatist Policy-Making*, Beverly Hills: Sage, 1982, and Suzanne D Berger (ed), *Organizing Interests in Western Europe*, Cambridge: Cambridge University Press, 1981.

representation in which both pluralist and corporatist structures play key and enduring roles, yet in which neither mode of representation attains anything approaching universal or permanent hegemony.

The task of tracing, mapping, and explaining persistently heterogeneous systems leads us to focus on conflict, change, and most of all on history. This encourages a more effective integration of the study of interest groups with the study of political development by drawing our attention to long-term historical transformations in associational life, especially in systems where the on-going tension and competition between pluralist and corporatist principles promotes periodic or even cyclical fluctuations in the predominant mode of representation.

Such a perspective invites us to classify different types of heterogeneous systems by identifying the major ways in which pluralist and corporatist subsystems tend to coexist and by identifying the consequences of each pattern of coexistence for the political system as a whole. For example, in an earlier work I advanced a preliminary classification of heterogeneous systems of representation into three types. I argued that all three patterns of associational heterogeneity could emerge at different times in the same political system. More generally, I also suggested that each pattern tends to characterise a different level of political-economic development and a different geographical-cultural area.³

Recognition and analysis of persistent associational heterogeneity has advanced farthest regarding the 'societal corporatist' systems of Western Europe.⁴ Several writers have noted that these covert and collaborative corporatist arrangements are embedded in and constantly interacting with political party organisations which still dominate more

³ Robert Bianchi, *Interest Groups and Political Development in Turkey*, Princeton: Princeton University Press, 1984, chap. 9. I identified cases of 'segmentary coexistence' in which the mutual isolation of differentially organised sectors tends to suppress the expression of interest conflict, cases of 'representational dualism' in which the antagonistic competition of pluralist and corporatist coalitions tends to exacerbate interest conflict and cases of 'symbiotic coexistence' in which the harmonious collaboration of pluralist and corporatist sub-systems tends to resolve interest conflict. I examined segmentary coexistence in several authoritarian regimes in Asia, representational dualism in the fragile democracies of Latin America's industrialised southern cone, and symbiotic coexistence in the democracies of Western Europe.

⁴ Schmitter distinguishes between two varieties of corporatism in which interest groups are similar in structure but very different in terms of their relations with the state. He speaks of 'societal corporatism' in democratic systems where groups are relatively autonomous of state control and exert a strong influence in the policy-making process versus 'state corporatism' in authoritarian systems where groups are subordinated to state control and are penetrated by official bureaucratic and party organisations. Schmitter, 'Still the century of corporatism?', *op. cit.*

public and competitive pluralist arenas of decisionmaking. Indeed, it is now commonly suggested that societal corporatism, once seen as a remedy to the supposed inadequacies and excesses of pluralism, has itself generated an unanticipated pluralist resurgence by provoking party-electoral realignments, rank and file revolts within associational cartels, and new social movements of previously quiescent 'policy-takers'.⁵

Similar, though less numerous, accounts of heterogeneous systems have appeared concerning the deeply divided democracies of Latin America that preceded and paved the way for a new generation of 'bureaucratic-authoritarianism' and dependent development. Many writers have explained that democracy in these countries was torn apart by uncontrollable polarisations between left and right in which pluralist groups confronted corporatist groups as mutually exclusive channels mobilising antagonistic social classes. In each case, after prolonged stalemate, military might purged the system of its pluralist 'inconsistencies' and firmly established the dominance of 'state corporatism'.⁶

The study of associational heterogeneity is considerably less advanced in the areas of the Middle East and Asia. Interest group politics in these regions commonly are perceived either as inadequate attempts to replicate classic Anglo-American models of democratic pluralism or as budding imitations of Latin American varieties of authoritarian corporatism. Authoritarian regimes in many Middle Eastern and Asian countries have, indeed, promoted corporatist associations as instruments of social control. But they generally have avoided the high levels of repression that would be necessary to eliminate the vestiges of pluralism and to impose a uniform or cohesive corporatist system. Instead they have opted for strategies of corporatisation that are far more tentative, partial, and inconsistent

⁵ See, for example, Gerhard Lehmbuch, 'Concertation and the structure of corporatist networks', in John H Goldthorpe (ed), *Order and Conflict in Contemporary Capitalism*, New York: Oxford University Press, 1984, pp 60-80 as well as the essays by Claus Offe and Alessandro Pizzorno in the Berger volume.

⁶ Philippe Schmitter, 'The "Portugalization" of Brazil?', in Alfred Stepan (ed), *Authoritarian Brazil*, New Haven: Yale University Press, 1973, pp 179-232; Robert Kaufman, *Transitions to Stable Authoritarian Corporate Regimes: The Chilean Case?*, Beverly Hills: Sage, 1976; and Guillermo O'Donnell, *Modernization and Bureaucratic-Authoritarianism*, Berkeley: University of California Institute of International Studies, 1973.

than the Latin American examples with which often they are compared.⁷

An eclectic and alterable mixture of corporatist, pluralist, and hybrid structures may be attractive to authoritarian modernisers for several reasons. It alleviates the need for sustained and widespread campaigns of coercion involved in more ambitious efforts to recast entire associational systems from a common mould. It promotes a shared sense of weakness and disorganisation among groups isolated in differentially structured compartments that can be reshuffled at the whim of the ruling elite.

A mixed system of representation can help to preserve the autonomy of the authoritarian state not only *vis-à-vis* potential opponents, but also *vis-à-vis* ambitious allies aspiring to become full coalition partners or to manoeuvre the state into guaranteeing a particular imbalance of power between contending social classes. Finally, such a system can provide authoritarian modernisers an important measure of flexibility and adaptiveness in reordering their relations with dominant and subordinate social groups. This can enhance a regime's chances of implementing and surviving abrupt changes and even complete reversals in its economic policies, its social bases of support, and its international alliances.

In many mixed authoritarian systems the coexistence of pluralist and corporatist structures produces paradoxical results. Indeed there is a frequent and ironic inversion of roles between groups that challenges our conventional expectation that pluralism will promote pressure for more genuine democracy while corporatism will buttress ever more invincible forms of authoritarianism. Instead we see several systems in which pluralist policies operate not as catalysts for disruptive participation and demand-making, but as valuable instruments of authoritarian control. Similarly, corporatist policies of co-optation, 'concertation', and coercion often unwittingly provoke precisely the kinds of political opposition they seek to prevent and even provide them with ready-made channels for counter-mobilisation.

Pluralism can help to support stable authoritarianism in several ways. It can maintain a facade of voluntarism and respect for the freedom of

⁷ Two examples of such regimes are Indonesia and Thailand. Dwight King, 'Social mobilization, associational life, interest intermediation, and political cleavage in Indonesia', PhD dissertation, University of Chicago, 1977 and Montri Chenvidyakarn, 'Political control and economic influence: a study of trade associations in Thailand', PhD dissertation, University of Chicago, 1979.

association that is sufficient to satisfy the very modest expectations of international lenders and donor democracies for evidence that non-communist authoritarians are behaving in a tolerant, 'tutelary' or even quasi-democratic manner. It can serve as a powerful tactic of disorganisation and fragmentation by delaying the emergence of unified representatives in sensitive sectors and by promoting the proliferation of weak, financially dependent and squabbling leaders who can be manipulated and discarded by government patrons.

Pluralism also can allow state security and intelligence agencies to acquire otherwise unattainable information about the strength and intentions of interest group leaders and to amass copious files of their 'subversive' statements and activities for later use in criminal proceedings. Finally, pluralism can serve as a form of punishment for group leaders who refuse to collaborate in state-controlled corporatist arrangements and as a vivid reminder of the marginal, precarious, and impotent roles awaiting current collaborators who might try to exploit the privileges of corporatism in an independent manner.

Alternatively, corporatist policies can seriously destabilise and even help to undermine authoritarian regimes. In some sectors corporatism can become too co-optive and 'inclusionary'. This can result in a partial surrender of policy-making to veto groups whose political support is indispensable to the authoritarian coalition, but whose privileges nevertheless must be curtailed if the regime is to adapt and survive. In other sectors co-optation of particular leaders and organisations can result in the alienation of a general constituency and its recurrent explosion in rank-and-file revolts against the isolation and betrayal of its own representatives.

Corporatist policies have an uncanny propensity for dividing those they seek to unite and uniting those they seek to divide. On one hand, the clearly discriminatory and 'asymmetrical' nature of most corporatist arrangements can intensify rivalry and disarray within and between the very sectors the state wishes to rationalise and coordinate. On the other hand, all sorts of aggrieved groups which are excluded from or unsuccessful in the corporatist arena may be able to suspend their mutual differences long enough to collaborate in fashioning a parallel and competing pluralist arena as the preserve of a mounting political opposition.

No authoritarian regime relies exclusively or even primarily on corporatism. The unreliability of corporatist means of social control and the vulnerability of authoritarian regimes that employ them are evident

from the long list of alternative control techniques that invariably are required to reinforce and sustain the edifice of corporatist occupational associations. This list includes cosmetic islands of associational pluralism; contrived party-electoral systems and recurrent promises of 'political openings'; incessant ideological campaigns, production drives, and neo-traditionalist revivals; the launching, atrophy, and reincarnation of successive ruling party organisations; multiple and overlapping domestic intelligence services; the exaggeration or fabrication of external threats to national security; and, when all else fails, coercion, terror, and exile.

The prevalence in the Middle East and Asia of heterogeneous systems of representation requires a rethinking of conventional assumptions, derived primarily from Western European and Latin American experiences, about the historical and causal connections between pluralism and corporatism. For example, most analysts of societal corporatism and state corporatism regard corporatist arrangements as comprising a new system of interest representation that arises in response to and ultimately *replaces* a more 'unruly' pluralist system.⁸ However, many authoritarian modernisers in the Middle East and Asia have tried to use corporatism as a *supplement* to pluralism rather than as a replacement for it. They intentionally have avoided trying to impose ambitious and cohesive corporatist systems, preferring instead to combine supposedly incompatible elements of both pluralism and corporatism. Moreover, in many countries where authoritarian elites have attempted to force associational life into a tighter state corporatist mould their regimes have been deeply shaken or overturned by unanticipatedly powerful oppositions. In these cases it may be more accurate to argue that corporatism itself has been a source of new political instability and the unintended *cause* of a more vigorous pluralism.

'Unruly' corporatism in the Middle East and Asia

Observers of societal corporatism in Western Europe and state corporatism in Latin America commonly argue that these systems are more stable or governable to the degree that corporatist structures and processes have eclipsed pluralist ones. Regarding the Middle East and

⁸ See, for example, Schmitter's essay in the Berger volume where pluralism is closely identified with 'unruliness' and corporatism is identified with political stability.

Asia, however, there is substantial evidence that corporatism is most effective when combined and diluted with pluralist elements in a heterogeneous system of representation, especially when the segmentary coexistence of isolated and differentially organised groups serves to fragment civil society and prevent the emergence of autonomous centres of power.

Alternatively, corporatism is most troublesome and destabilising when authoritarian elites abandon such flexible and pragmatic arrangements and try to reshape associational life into a more cohesive instrument of political domination and economic mobilisation. When authoritarian modernisers with diminishing political tolerance and rising economic ambitions seek to impose a 'purer' brand of corporatism they may unwittingly pave the way for the coalescence of previously divided or mutually hostile groups into a new opposition movement that can threaten the very existence of the regime or greatly reduce its autonomy from the demands of specific social and economic sectors.

I will attempt to illustrate these points with examples of unstable and self-defeating corporatist experiments in four authoritarian regimes in the Middle East and Asia—the experiments of Anwar Sadat in Egypt, Muhammad Reza Shah Pahlavi in Iran, Park Chung Hee in South Korea, and Indira Gandhi's emergency regime in India. These countries are quite diverse in terms of both degree and type of interest group organisation. Associational life is most advanced and heterogeneous in Egypt where it is predominantly corporatist and in India where it is predominantly pluralist. Associability has been substantially more repressed in Iran and South Korea, yet both countries possess extensive corporatist structures in some key sectors. In Iran, merchants and religious leaders preserved unique and powerful forms of traditional corporatism capable of checking and ultimately helping to smash the power of the modern state. In South Korea, soldiers and technocrats took their hopes for rapid industrialisation and political survival on their ability to fashion new forms of corporatist control for a working class whose numbers multiplied five times in less than two decades. In each of these countries, however, efforts to establish a 'new authoritarianism' through the abrupt introduction or intensification of state corporatist policies produced not a Third World replica of bureaucratic-authoritarianism', but a more powerful political opposition containing many newly strengthened elements of pluralism.

Egypt: the ambivalent corporatism of Anwar Sadat

Anwar Sadat never came to terms with the extensive but incoherent network of corporatist occupational groups that he inherited from Jamal Abd al-Nasser. At first, he regarded them as potentially dangerous vestiges of authoritarian socialism that were incompatible with his supposed desire to redirect Egypt toward capitalist and democratic development. Then as Sadat became disenchanted with pluralist strategies of reform, he began to fashion his own improvised brand of corporatism as a more cautious and controllable means of combining political and economic liberalism. Finally, Sadat abandoned both pluralist and corporatist policies of democratisation and prepared instead for the coercive imposition of a more comprehensive and centralised system of authoritarian corporatism.

As long as Sadat tolerated and manipulated Egypt's traditional mixture of contrived pluralism and incoherent corporatism he was remarkably successful in almost single-handedly reversing his country's economic and foreign policies despite mounting protests from a wide variety of aggrieved groups. But, as it became increasingly clear that he had opted for a more ambitious authoritarian design, Sadat triggered simultaneous confrontations with numerous groups many of which temporarily overcame their deep divisions to form an unusually broad and unified opposition movement. The traumatic results of these confrontations, including the assassination of Anwar Sadat, have made Egypt's current rulers more reluctant than ever to risk antagonising powerful and well-organised interests. Thus Sadat's efforts to bolster the authoritarian regime with tougher corporatist policies has, in fact, weakened its ability to formulate any decisive strategy of reform. The result has been a new period of drift and procrastination in which the country's economic stagnation continues and its social conflicts intensify.

From 1970 until 1976 Sadat perceived Egypt's largest occupational associations—the labour unions and agricultural cooperatives—as particularly menacing 'centres of power' that could be used to mobilise support for his opponents on both the left and the right. Sadat was not eager to endorse any pluralist reform of the party and electoral systems until he was confident that these key corporatist groups would not fall into the hands of the Nasserists, communists, and Wafdist. Thus he moved swiftly to purge and thoroughly restructure the union and cooperative movements while allowing one committee after another to debate countless proposals for the transition from single-party dictatorship to multi-party democracy.

Sadat encouraged a year-long muck-raking campaign against the president of the Confederation of Agricultural Cooperatives whom he suspected was helping to prepare provincial and village organisations to back Wafdist candidates well in advance of the 1976 parliamentary elections. Sadat's goal was not merely to remove a potential opponent from a sensitive position, but to emasculate the cooperative movement as a whole. While the confederation president was on trial for corruption and embezzlement the confederation itself was abolished, leaving a multitude of small and scattered cooperatives with no independent centre of coordination or financing. Eventually, most of the functions, funds, and even the buildings of cooperatives were turned over to a new network of 'Village Banks', operating not as government credit agencies but as local investment banks promoting the business enterprises of the regime's supporters among the rural middle class.

Sadat did not risk this sort of broad attack against the far stronger and better organised labour movement. Rather than try to cripple or abolish the General Confederation of Labour Unions he assented to a series of centralising reforms that greatly enhanced its powers as a peak association while cutting it off from its own constituency.⁹ Of course, these measures did not diminish the opposition of many labour leaders to the dismantling of the Arab Socialist Union or the discontent of workers with capitalist economic policies. This was already evident from the poor performance of government-backed lists in urban-industrial areas during the 1976 elections, and it was dramatically underscored in the nationwide 'bread riots' of January 1977. Nevertheless, Sadat's ability to isolate growing working-class opposition was greatly aided by his encapsulation and neutralisation of the top union leaders who, in turn, played upon the government's insecurities in order to extract still more organisational concessions and privileges.

Once he had dealt with the cooperatives and unions, however, Sadat's early aversion to corporatism quickly disappeared. By early 1977 he was in clear retreat from encouraging the emergence of a pluralist process that was certain to be exploited and perhaps controlled

⁹ By 1976, confederation leaders were granted most of the demands for union reorganisation that Nasser had accepted in principle during the mass protests of 1968, but which never had been codified. Confederation leaders were given legal guarantees of job security and retirement benefits, *ex officio* status in planning boards and policy councils, exclusive control over leadership training programmes, authorisation to establish an independent bank, stronger control over union federations and locals, and greater immunity from electoral challenges and rank-and-file protests.

by his opponents. During the next four years he shifted his efforts away from launching a new system of competitive parties and toward reshaping the existing set of corporatist interest groups into more reliable instruments of control and co-optation. Yet even during this period Sadat's brand of corporatism was highly idiosyncratic and eclectic, still tolerating and manipulating many features of pluralism rather than trying to extinguish them.

First, the presidential personality was increasingly endowed with neo-traditionalist attributes of religiosity and paternalism. The president was now known as 'the believing president' (*al-ra'is al-mumin*), *Muhammad* Anwar Sadat. He referred to himself as 'the elder of the Egyptian family' (*kabir al-aila al misriya*) and the guardian of authentic national morals which supposedly were best exemplified in the unspoiled fabric of village society. Weekend newscasts invariably were dominated by films of the president performing the Friday noon prayer in his family's village of Mit Abu al-Kum and then appearing, clad in his *gallabiya* and holding his walking-staff, to 'consult' with members of the village council.

Second, electoral and judicial processes were distorted to reflect these presidentially personified values and to enforce the tyranny of the provincial majority. A long list of plebiscites produced predictable but incredible majorities ratifying constitutional amendments that included restrictions on political party formation, abridgements of the freedom of association, and new means of press censorship. A new 'Law for the Preservation of Values' (dubbed the 'Law of Shame' by its opponents) established a special court to deal with trouble-makers who 'defamed' the nation, especially those who criticised Sadat's 'normalisation' of relations with Israel.

Third, Sadat made a particular effort to strengthen his alliances with several corporatist syndicates in the business community and among middle-class professionals. Sadat used a variety of techniques to transform these associations into more reliable bases of political support and more effective agents of capitalist development. He encouraged grater colonisation of the syndicates by the ruling party; he packed the memberships of these groups with large numbers of civil servants who were far more susceptible to government pressures than their colleagues in the private sector; he promoted a new spirit of 'syndical capitalism' by providing profitable opportunities for professional associations to establish business enterprises, including joint ventures with foreign investors; and, when necessary, he redrafted laws regulating syndical

organisation and activity to tip the balance of power in favour of pro-government factions.

Fourth, Sadat made a grand if half-hearted display of his willingness to share power with the leaders of occupational associations in a kind of 'corporatist democracy'. During the holy month of Ramadan 1979 he met each evening after the *iftar* (fast-breaking) meal with a different assemblage of interest group leaders to discuss creating an 'upper' chamber of the legislature whose members would be drawn primarily from the corporatist associations. Business representatives were particularly candid and straightforward in outlining their view of the president's alternatives for structuring the new Majlis al-Shura (Consultative Assembly). If the chamber was to be a true syndical parliament with legislative powers, they said, then its members should be elected from the various functional groups comprising the 'Egyptian family'; on the other hand, if the chamber was to be a ceremonial body, then the president should appoint its members and leave the syndicates out of the matter altogether.¹⁰

Typically, Sadat chose neither of these clear alternatives, preferring instead a hybrid formula that eventually alienated most of the groups it was designed to co-opt. The Majlis al-Shura was created in 1980 as a consultative chamber with very limited policy-making powers that amounted to supervising a cumbersome new system of press censorship. One half of its members were elected not from corporatist syndicates, but from party lists in geographical districts as in the People's Assembly. The other half of its members were appointed by the president as representatives of key functional groups and national institutions. However, the syndical leaders had no role in the selection and there was no effort to revive any of the quota systems or schemes of functional representation that Nasser had devised in the 1960s. All of the opposition parties boycotted the elections to the Majlis al-Shura and several prominent presidential appointees declined their seats. Thus the net product of Sadat's experiment in corporatist democracy was a collection of local party functionaries and aged luminaries who represented no one and who had virtually nothing to do.

Disappointed with these meagre results, Sadat finally turned to much tougher corporatist measures. By the end of 1980 he had become highly irritated with the considerable room for manoeuvre that his opponents

¹⁰ These conversations are recorded in the minutes of President Sadat's meetings with interest group leaders. *Al Haya al-Amma lil-Istalamat, Misr wa Masirat al-Dimuqratiya* [Egypt and the Journey of Democracy], Cairo: Mataba al-Akhbar, 1980.

found in Egypt's *mélange* of pluralist and corporatist associations. Over the next several months he confronted one group after another with the threat of reorganisation and tighter state controls. The ruling party orchestrated the replacement of critical leaders in the journalists' syndicate by pro-government candidates. The People's Assembly dissolved the executive committee of the bar association and drafted a clearly punitive statute transforming the lawyers' relatively flexible and autonomous corporatist groups into the most rigid and highly regulated of all professional syndicates. Religious associations and private mosques—the only areas of associational life that remained predominantly pluralist—were placed under investigation for possible closure or outright annexation by the government.

By August 1981 Sadat was engaged in open struggles with all of the opposition parties (legal and illegal), several important interest groups (pluralist and corporatist), and a host of religious organisations (Muslim and Christian). He was surprised and alarmed to see that the traditionally effective barriers of organisational, ideological, and communal divisions were no longer adequate to prevent the coalescence of a heterogeneous opposition movement around a common set of powerful grievances—growing restrictions on political freedom, unchecked economic corruption and inequality, the failure of the Camp David 'process', and the government party's exploitation of religious disputes. Sadat's response to this challenge was the mass internment of over 1,500 persons representing virtually every shade of unofficial opinion, the exile of the Pope of the Coptic Church, and the immediate nationalisation of all non-government mosques. These attacks on the few remaining vestiges of associational autonomy provoked an even greater political crisis that culminated in Sadat's murder and that abated only when his successor took clear steps to free opposition leaders and to seek their cooperation.

Husni Mubarak benefited greatly from the general sense of relief that followed the assassination. He succeeded in promoting a welcome and quite lengthy 'era of good feeling' by holding regular summit meetings with the political opposition, by exposing some of the more spectacular examples of corruption among the new class of 'open door' entrepreneurs, and by inviting debate and revision of many of his predecessor's unpopular economic and foreign policies. Gradually, however, Mubarak's flexibility and accommodativeness were seen as concealing deeper signs of indecision and inconsistency, especially concerning competing strategies of economic development. Time after

time he has made incompatible commitments to international creditors and domestic interest groups, to labour unions and employers, to economic nationalists and free traders, to the wasteful socialism of the public sector and the corrupt capitalism of the private sector.

Mubarak has tried to reassure Egypt's most powerful social and economic groups that their competing demands can be reconciled by allotting each of them a secure niche or compartment in an economy that increasingly is becoming partitioned into differentially organised sectors and sub-sectors. In fact, this strategy has tended to intensify interest group competition, not to moderate it. The result has been a series of embarrassing reversals in important areas of economic policy as well as deepening divisions within the government itself as more and more ministries seek to veto initiatives that threaten the entrenched interests of their bureaux and constituencies.

Many of the same corporatist associations that originally had been fashioned as instruments of authoritarian control and economic regulation have become key contributors to the paralysis of the state and the fragmentation of the economy. The labour unions forced the Mubarak government to retreat from proposals for partial divestiture of public sector industries and to soften planned reductions in consumer goods' subsidies. Businessmen's groups weakened and eventually nullified government efforts to re-establish control over the banking and importing systems. The bar association claims that the new government's coolness toward Israel and gradual rapprochement with the Arab world has vindicated the syndicate's long years of opposition to Sadat's foreign policy. Leaders of the journalists' syndicate are joining forces with university students to demand the reinstatement of student unions abolished by Sadat. And a broad coalition of nationalist protesters recently manoeuvred Mubarak into using police force in a vain effort to defend the Israeli flag from burning at a Cairo exhibition centre.

The loose and alterable set of corporatist structures inherited from the Nasserist era were indispensable to Anwar Sadat's efforts to keep his enemies off-balance while carrying out far-reaching changes in the social bases of Egypt's authoritarian regime and in its economic and foreign policies. Sadat found numerous ways of manipulating and modifying corporatism, the most effective of which included admixtures and trappings of pluralism. However, when Sadat became intolerant of the openness of corporatist channels to manipulation by his opponents as well, he began to threaten the very flexibility and heterogeneity that

had made Egypt's associational life so useful to his shifting authoritarian strategies. Sadat's intention to remould Egyptian corporatism into a more cohesive system of control—an Egyptian variety of state corporatism—resulted instead in a counter-mobilisation of both corporatist and pluralist groups that jolted his regime and seriously limited the decisional autonomy of his successor.

Iran: the corporatism of the Shah versus the corporatism of the bazaar

For more than twenty years after the American-sponsored *coup d'état* that overthrew Musaddiq and the National Front, the Shah was extremely reluctant to permit any system of interest representation in Iran, pluralist or corporatist. The Shah's hostility to pluralism is easily understood. The rapid upsurge of voluntary associability between 1941 and 1953 among workers, farmers, students, intellectuals, and professionals had been so decisively dominated by the Tudch Party that even limited tolerance of pluralism must have seemed incompatible with the preservation of the monarchy, especially in the earlier years of the 'restoration'.

His aversion to corporatism, however, was more complex and less enduring. The Shah evidently feared that any new representative institutions created from above eventually could be infiltrated by his enemies and used against him. Even during the 1960s when his regime was on much firmer footing the Shah did not attempt to revive the collection of state-sponsored occupational groups that the aristocratic prime minister, Ahmad Qavam, had promoted in the late 1940s to draw off support from the left's more extensive forces.¹¹ Perhaps the Shah's hesitance to experiment with corporatist techniques of control can be explained by two important factors: one regional and ideological, the other national and historical.

Until the beginning of the 1970s the leading prototype of authoritarian corporatism in the Middle East was, of course, Nasserism. This, in turn, was synonymous with all of the forces that the Shah dreaded most—anti-imperialism, socialism, revolution, and, naturally, republicanism. Such an alien, menacing, and rhetorically charged variety of corporatism could only have confirmed the Shah's suspicion that even a highly contrived form of associational life would not help sustain the throne, thereby reinforcing his tendency to rely on symbol manipulation, material rewards, and systematic terror.

¹¹ Ervand Abrahamian, *Iran Between Two Revolutions*, Princeton: Princeton University Press, 1982, pp 238–9, 244–5.

Moreover, Iranian society already possessed the nucleus of an indigenous, traditional corporatism in the informal but extensive organisational networks of the bazaar and the *ulama*. The Shah reasonably might have concluded that there was no need for the state to create modern corporatist structures when fortune already had provided such enduring and potentially useful institutions to the very segments of the traditional middle class whose political support he viewed as indispensable. Thus one of the Shah's most important associational policies was his decision to tolerate the unique autonomy and power of these two corporatist groups even while gradually trimming their spheres of activity with other policies of industrialisation and secularisation.

But in 1975 the Shah abruptly reversed this policy by trying to build a one-party state around the new Resurgence Party (Hizb-i Rastakhiz) and its collection of government-controlled occupational branches.¹² With the aid of SAVAK the party took control of the major economic ministries and launched a direct assault on the half-million craftsmen and merchants in bazaars throughout the country. Claiming that the cause of rapid inflation was *bazaari* 'profiteering' rather than government mismanagement of the oil boom, the party enforced a series of measures during 1975 and 1976 that sought to wrest control of the economy from the bazaars and place it firmly in the hands of the state.

The party organisation opened new branches in the bazaars and began to extort 'donations' from businessmen. It also recruited thousands of people into vigilante 'inspectorate teams' with summary powers to fine hoarders and profiteers. Government ministries carried out a partial nationalisation of foreign trade by setting up state corporations to import and distribute foodstuffs. Labour and welfare agencies began harassing small workshops with new regulations for minimum wages, social security, medical insurance, and registration of temporary employees.¹³

Municipal authorities imposed higher sales taxes and prohibited construction or repairs in existing marketplaces. In Tehran the city government even threatened to route a planned super-highway through the centre of the main bazaar. Finally, the government abolished the traditional guild system and replaced it with new Chambers of Guilds

¹² *ibid.*, p 442.

¹³ Amir Taheri, 'The bazaar', *Kayhan International*, 2 October 1978, pp 98-101; Sapehr Zabih, *Iran's Revolutionary Upheaval*, San Francisco: Alchemy Books, 1979, pp 27-32.

controlled in the provinces by local governors and in Tehran by government functionaries and non-bazaar entrepreneurs from the 'oil bourgeoisie'. These structures were responsible primarily for imposing price controls and referring offenders to special Guild Courts where in less than one year over a quarter of a million shopkeepers were fined or closed down and another 30,000 were deported or imprisoned.¹⁴

These measures quickly radicalised the bazaar, drove it into alliance with the more militant leaders of the *ulama*, and provided Ayatullah Khomeini with his key base of support in what eventually became the Islamic Revolution. In the ensuing confrontation with the government, the traditional corporatist organisations of the *bazaaris* proved to be far superior to the Shah's hastily constructed version of state corporatism. The bazaar was particularly well suited to become the focal point of the revolution because of its strong ties with the provinces, with urban migrants, and with the *ulama*.

Leading *bazaari* families for generations tended to inter-marry not only with other merchant families, but also with families having the same provincial origins. This, together with constant commercial interchange, provided a nationwide chain of communication connecting Iran's historically isolated provincial capitals and towns.

Links with urban migrants were based not only on creditor and patronage relations, but also on the bazaar's finance and leadership of a wide assortment of popular religious groups that regularly organised neighbourhood worship outside the mosque. *Bazaaris* were the major sponsors of the *Shi'i* passion plays (*taziyas*) and religious festivals during the holy months of Ramadan and Muharram. In Tehran alone they were able to mobilise 5,000 procession leaders in the southern and eastern districts. The bazaar organised religious 'missions' (*heyats*) some of which administered hundreds of meeting places for mourning, religious instruction, and *Quran* recital. These missions also provided thousands of pilgrimage leaders who guided groups to the holy places in Iraq and Saudi Arabia.¹⁵

Finally, the bazaar was closely tied to the *ulama* by both family and financial relations. Many of the leading *ulama* originated from or married into *bazaari* families. Merchants financed the religious schools, seminaries, and charities run by the *ulama* and were reported to have contributed as much as 80 per cent of all private religious donations and

¹⁴ Taheri, *op. cit.*, p. 99; and Robert Graham, *Iran The Illusion of Power*, London: Croom Helm, 1978.

¹⁵ Taheri, *op. cit.*, p. 98; Zabih, *op. cit.*, p. 28.

taxes (*zakat* and *khums*). Although the Shah had been trying since the early 1960s to cut back the authority and resources of the religious institution, the prosperity and generosity of the bazaar allowed the *ulama* to expand their activities so that by the mid-1970s they had penetrated the urban shantytowns and for the first time many of the remote areas of the countryside.

In alliance the bazaar and the *ulama* comprised a political force far greater than the sum of its parts. Together they mobilised a mass opposition that was much more powerful than anything each could have accomplished separately. The *Shi'i ulama* of Iran retained a political prominence that was unparalleled anywhere in the Muslim world.¹⁶ Compared to their Sunni counterparts in other countries they enjoyed greater doctrinal authority and unity, more cohesive and hierarchical organisation, a much stronger tradition of independence from the state, and greater ability to act as an effective pressure group in influencing public policy. They were, in other words, the closest thing in Islam to a 'clergy' or, more accurately, the most corporatised and self-sufficient group of spiritual leaders in a religious tradition that for centuries has been characterised by pluralist factionalism and recurrent appeals for state assistance in eliminating rivals.

Nevertheless, by themselves the *ulama* could have mounted no more than a rearguard action against the Shah's growing determination to subordinate their informal and unique institutions to his more 'rationalised' and comprehensive version of authoritarian corporatism. It was the simultaneous assault upon both *bazaari* and religious organisations that antagonised the traditional middle class in general and destroyed the few remaining bridges connecting the regime to Iranian society. By endorsing the reckless campaigns of the Resurgence Party the Shah was not laying the foundation of a more modern authoritarianism, but alienating and radicalising traditional supports he had never before dared to abandon.

Of course, the Iranian Revolution was not simply the product of a 'corporatist coalition' of traditional middle-class groups led by the *ulama* and supported by the bazaar. Nor is it likely that such groups alone could have mobilised a following of revolutionary proportions.

¹⁶ Leonard Binder, 'The proofs of Islam', in George Makdisi (ed), *Arabic and Islamic Studies in Honour of Hamilton A R Gibb*, Leiden: E J Brill, 1965, pp 118-40; Hamid Algar, 'The oppositional role of the ulama in twentieth-century Iran', in Nikki R Keddi (ed), *Scholars, Saints, and Sufis*, Berkeley: University of California Press, 1972, pp 231-56; and Shahrough Akhavi, *Religion and Politics in Contemporary Iran*, Albany: SUNY Press, 1980.

But during 1977 the Shah sought to check this growing opposition by introducing yet another shift in associational policy, this time in the direction of pluralism. The Shah was willing to consider a slight relaxation of police controls to allow the re-emergence of voluntary organisations under what he hoped would be more moderate and reformist secular leadership. Old groups were permitted to revive and new ones to form among several segments of the modern middle class—lawyers and judges, writers and intellectuals, university students, white-collar employees, and even guerrilla fighters.¹⁷

But after a quarter-century of repression, secular-nationalist politicians did not possess and could not construct alternative pluralist associations capable of restraining mass emotions or of supporting a liberal compromise with the monarchy. 'Liberalisation' did not calm or divide the Shah's opponents, especially as it coincided with a protracted recession brought on by tight money policies designed to 'fine tune' Iran's boom economy. In the final months of 1977 the Shah sought to end the new groups' growing street demonstrations by returning to repression, but this merely drove the burgeoning pluralist opposition of the modern middle class into stronger alliance with the more entrenched corporatist opposition of the traditional middle class.

By terminating his timid experiment with pluralism the Shah alienated the newly activated voluntary groups just as certainly as his hasty conversion to state corporatism earlier had alienated the guilds. Thus he made possible the coalescence of groups that were far more diverse in organisational structure, class composition, and ideological orientation than any movement the radical *ulama* could have hoped to mobilise unilaterally.

Early in 1978 Khomeini and the leaders of the National Front issued their first joint call for a general strike in the Tehran bazaar, initiating the series of massive and remarkably non-violent demonstrations that drove the Shah from his throne within a year.¹⁸ Khomeini skilfully nurtured the formation of this coalition with assurances of his democratic intentions, his commitment to social justice, and his friendliness to the followers of Ali Shariati. Yet the 'Imam' had no more valuable assistance than the erratic and seemingly self-destructive associational policies of the Shah himself.

South Korea: corporatism as the midwife of radical unionism

The construction of a corporatist system of labour control was essential to South Korea's spectacular industrial advance under the regime of Park Chung Hee during the 1960s and 1970s. The gradual dissolution of that corporatist system was equally central to the political crisis that led to Park's assassination in 1979. Ironically, it was the Korean Central Intelligence Agency that was most directly responsible for both creating and operating the corporatist unions and, then, for murdering the president when he insisted on preserving them despite their destabilising impact on the authoritarian order.

Park's ambitious strategy of export-oriented industrialisation was predicated upon mobilising a new generation of manufacturing workers to supply cheap, docile, and high-performance labour.¹⁹ Korean planners viewed the potential of this workforce, not the domestic market or natural resources, as the major source of the country's comparative advantage and as the most attractive lure for foreign investment. Accordingly, agricultural policy was geared not to raising local production, but to creating a huge surplus of low-wage labour. By holding down farm investment and relying on imported foodstuffs, the government encouraged a massive depopulation of the countryside and swelled the urban labour market. During the eighteen years of Park's rule over seven million peasants—about one-fifth of the total population—migrated to the cities and the number of manufacturing workers swelled from 600,000 to three million. The organisation, control, and motivation of this new industrial workforce was one of the greatest challenges facing the authoritarian regime. Thus from its inception Park's combination of mercantilism and militarism—his quest to revive in Korea the Meiji formula of 'rich nation, strong army'—entailed an important corporatist dimension as well, particularly toward workers in the key exporting industries.

Shortly after its creation by the new junta in 1961 one of the first assignments of the KCIA was to carry out a purge and thorough reorganisation of the labour movement.²⁰ Older union leaders were removed, ending the long dominance of the party bosses tied to

¹⁹ South Korea's industrialisation policies are examined in two recent dissertations: Dal Joong Chang, 'Japanese corporations and the political economy of South Korean-Japanese relations, 1965-1979', PhD dissertation, University of California, Berkeley, 1982 and Hyun-Chin Lim, 'Dependent development in the world system: the case of South Korea, 1963-1979', PhD dissertation, Harvard, 1982.

²⁰ Jang Jip Choi, 'Interest conflict and political control in South Korea: a study of the labor unions in manufacturing industries, 1961-1980', PhD dissertation, University of Chicago, 1983.

Syngman Rhee and cutting off the brief re-emergence of leftist unionism that followed the 1960 student revolts. These leaders were replaced by a younger cadre of thirty unionists who were hand-picked and trained by the KCIA. Using this group as a nucleus, the KCIA quickly transformed the union movement from a multitude of small, enterprise organisations grouped in rival confederations into about a dozen large industrial federations tied to a single peak association, the Federation of Korean Trade Unions. When militant unionists attempted to establish a rival confederation, a new labour code was enacted in 1963 to formalise the transition from pluralism to corporatism.

Henceforth, changes in labour and union policy were connected closely with, and occasionally anticipated, steady increases in the level of repression in the political system as a whole. In 1969 a special system of compulsory arbitration was created for the new free exporting zones that were established to attract foreign direct investment, especially from Japanese multinational corporations.²¹ In 1971 compulsory arbitration was extended to all firms and a state of emergency was imposed primarily to quash new signs of independence and protest from the first generation of industrial workers. Having subdued the labour movement, Park launched the second and more coercive phase of authoritarianism, the Yushin (Revitalising) System, designed to tighten and perpetuate his personal rule. Then, in 1973 and 1974 when ambitious plans to shift investment from light to heavy industry were jeopardised by the oil crisis, new labour laws removed collective bargaining from the industrial union federations and placed it in the hands of government-sponsored labour-management councils in individual enterprises.

Although corporatist unionism provided Korea's authoritarian modernisers with nearly a decade of relative industrial peace, the system rapidly broke apart with the massive entry of new workers during the 1970s. Many young Korean workers developed a militant union consciousness in an amazingly short time—in some cases as rapidly as they learned the routine of factory work itself.²² Naturally, this was promoted by exploitative characteristics of employment that are common in many industrialising countries. However, radicalisation was encouraged more directly by three other factors which sharply

²¹ Chang, *op. cit.*, ch 3.

²² Choi, *op. cit.*, ch 8.

distinguished the experiences of Korean workers—their unusually high rate of literacy, their receptivity to female leadership, and their broad exposure to Liberation Theology through the Christian missions.

The nearly universal literacy of new workers was a mixed blessing for their employers. It speeded adaptation to modern industry and allowed Korea to enhance the reputation for diligent, high-quality labour that was so critical to its international competitiveness. Yet it also hastened workers' realisation that they possessed legal rights that generally were violated in practice and that could be redeemed only through energetic collective action. Korean workers became quite adept at devising legal means of pressure and protest that dramatised daily injustices in the work-site and highlighted their connections with the larger context of exploitation and repression.

The high concentration of young women workers in exporting manufacturing industries was a similarly double-edged phenomenon. Unmarried females often were preferred and indeed actively recruited through personal networks in the countryside on the assumption that they would be low-cost temporary employees and, above all, with the expectation that they would be timid and tractable *vis-à-vis* male supervisors and union officials. Yet, in numerous firms in the important textiles and electronics sectors, new majorities of female workers threw out company-sponsored male unionists, spontaneously organised the first independent locals, and provided the cutting edge of new labour militancy. Indeed, it has been argued that in Korea young women were the most committed and altruistic union leaders, that their defiance of male intimidation earned broad public admiration, and that their organisations were considerably more outspoken critics of the regime than opposition parties.²³

External support for radical unionism came from several student groups, labour research institutes, and, most importantly, from about twenty Protestant and Catholic church organisations, the largest of which was the Urban Industrial Mission. During the late 1960s these church groups, influenced by the example of Latin America's liberal bishops, began to focus their campaigns for human rights on the struggling union movement. At first they supported the official labour confederation, thinking that unionisation could be promoted most effectively by working downward through existing organisations. However, after the imposition of the Yushin system, the corporatist

²³ *ibid.*, ch 3.

confederation became increasingly integrated into the authoritarian order and the UIM shifted its efforts to the new generation of independent unionists emerging at the plant level. The success of the industrial missions was by no means an isolated phenomenon. Rather it was part of an explosive growth of Christianity—from about four and one-half million to over ten million in less than ten years—that coincided with the gradual loss of political freedom and economic security during the second decade of Park's rule.²⁴

By the mid-1970s the Korean labour movement had divided into two bitterly opposed segments—the corporatist apex with its network of yellow (*yeoyong*) unionists supported by employers and the KCIA versus a growing pluralist base of militant locals aided by internationally funded church groups and aligned with the political opposition. The radical groups included about one-fourth of all manufacturing unions and as much as one-fifth of the industrial workers in large plants dependent on foreign investment and export markets.²⁵

Faced with mounting pressures from below, corporatist union leaders tried to place a higher price on their cooperation with business and government. They urged the government to grant them wider powers to suppress rank-and-file dissent and argued that their loyalty had earned them a more prominent role in economic policy making. Through most of the 1970s Park rejected official unionists' efforts to negotiate this sort of *quid pro quo* and preferred to rely on an assortment of newer techniques of labour control. At first, he collaborated with employers in promoting new groups to rival and weaken unions at the enterprise level. Then, after he realised that such measures often stimulated further radicalisation, Park belatedly and half-heartedly permitted tentative efforts to create a Korean variety of tripartism.

Labour-management councils originally were welcomed by union leaders who thought they might evolve into something like the Japanese 'quality circles' or even a rudimentary form of co-determination. Instead they gradually became clear competitors to the unions, taking over the discussion of grievances in a 'family-like' manner and enforcing new 'ethical codes' for workers. In expanding the authority of these councils at the expense of the official unions, the government appeared to recognise that conventional corporatist techniques could no longer preserve the motivation and commitment required for a high-performance workforce. Corporatism, it was believed, had to be

²⁴ *ibid.*

²⁵ *ibid.*

supplemented with more emphasis on normative and ideological controls.

The clearest expression of this shift in strategy was Park's enthusiastic campaign on behalf of the Factory Samaul (New Community) Movement. Samaul groups had originated in the agricultural sector where they attempted to reverse the steady decline in rural income by encouraging cooperatives and off-season employment. In extending the movement into industrial workplaces Park made the Samaul groups the centrepiece of his effort to shore up the Yushin system through popular mobilisation in the spirit of 'diligence, self-help, and cooperation'. His objective was to recover some of the support that had been lost in the countryside after long years of neglect, while applying new pressures on factory workers to make additional sacrifices so that the energy crisis would not jeopardise Korea's new phase of heavy industrialisation.

The 'Samaul spirit' promoted highly romanticised images of agrarian collectivism and family harmony and held them up as models for ordering relations in the modern factory and in the nation as a whole. This was part of a larger effort to revive aspects of traditional culture that the regime perceived as most compatible with capitalist development and authoritarian rule. A parallel campaign, the New Spirit Movement, stressed more clearly the continued importance of such Confucian values as filial piety and social hierarchy. This movement portrayed Park as the paterfamilias of Korean society and was led, appropriately enough, by the president's daughter.²⁶

The insertion of these new groups into industrial enterprises tended to sharpen tensions between the corporatist unionists at the top and their more militant rivals at the base. The official labour confederation assumed more and more responsibility for training and directing groups whose major activities were discouraging the formation of new local unions, reviving the practice of unpaid overtime, and wiping out earlier gains achieved through local union bargaining and protest. As the corporatist union structure broke apart and spawned still greater radicalism among the rank and file, Park became more willing to consider some of the proposals for interest-group consultation and concertation that he had rejected earlier.

Interest in tripartism grew out of mounting alarm among employers over the rise in industrial disputes and protective labour regulations. In 1970 the Korean Employers' Association was established by small and

²⁶ *ibid.*, ch 4.

medium-sized firms which were particularly sensitive to increasing labour costs and union activity. By 1975 their overtures for dialogue with the union confederation were translated into the Labour-Management Friendly Meeting which convened with government labour administrators for semi-monthly talks. In 1978 it was the labour confederation that took the initiative in organising a second tripartite forum, the Workers' Welfare Policy Deliberation Committee. The following year, government technocrats advanced their own proposal for yet another, more comprehensive body, a Social and Economic Council, which they claimed was inspired by West German and Dutch practices.²⁷

In fact, none of these multiple commissions ever amounted to much. While the employers pursued the unionists to negotiate a 'social contract', the unionists were pursuing the government to grant them, at last, the powers and material concessions they would need to enforce such an agreement in the face of nearly certain revolt from below. Many of Park's advisers seemed to support this course, realising that existing corporatist arrangements needed much more than a gloss of neo-Confucianism in order to restore industrial peace. Korea's corporatist unions simply were too weak to control and too contrived to represent. They had become at the same time the agent and the target of an alternative union movement that continued to gain force in spite of an endless series of counter-measures from the government. Nevertheless, Park rejected any substantial change, allowing each group to advance its favoured project for a new, more consensual variety of corporatism and lending his support to none.

When Park decided that the surest remedy for labour unrest was greater coercion he touched off a nation-wide political crisis that rapidly split his regime and ultimately ended his life.²⁸ The catalyst for the crisis was a long and bitter protest of female textile workers who were demanding that the state salvage their jobs in one of the many private firms that had gone bankrupt during the 1978-9 recession. Evicted from their dormitories, the women occupied the headquarters of the opposition New Democratic Party, thereby encouraging the rise of new militant leaders who were critical of their party's long indifference to labour issues. After riot police attacked the demonstrators causing many casualties the disturbances quickly spread to the universities.

²⁷ *ibid.*, ch 6.

²⁸ Chong-Sik Lee, 'South Korea 1979: confrontation, assassination, and transition', *Asian Survey* 20(1), January 1980, pp 63-76.

What began as an isolated industrial dispute soon developed into a broad protest movement encompassing the church groups, the radical unions, the newly emboldened opposition party and the students.

The breakdown of Park's regime was a direct result of divisions among his top aides over how to confront this sudden and vigorous upsurge of pluralism. The president himself ordered an attack on the Urban Industrial Mission, a reinforcement of the Factory Samaul groups, and a firm show of force through the KCIA. However, both current and retired directors of the KCIA—those most responsible for the creation and supervision of the union organisation—urged the president to make concessions to worker and student demands. They argued that some sort of political accommodation was unavoidable in view of the deteriorating economic situation and American objections to the repression of human rights. When Park criticised the KCIA's tentativeness in putting down the demonstrations and his security chief prepared paratroopers for the approaching confrontation in the capital, both men were assassinated by the head of the KCIA.²⁹

During the temporary paralysis of the security apparatus that followed, Korea experienced an unbridled wave of wildcat strikes that startled the state, the employers, and the official union leadership. After several months a new junta of younger officers consolidated power, but they substantially raised the level of repression against workers and imposed new union legislation that was far more restrictive than any of the Yushin measures. Corporatism had been one of the keys to creating South Korea's principal advantage in the international market-place—a high-performance workforce that remained compliant despite low rewards. But in post-Yushin Korea the authoritarian elite and their industrialist allies have been forced to accept a serious erosion of that advantage which is unlikely to be reversed unless they are willing to accommodate the growing pluralist tendencies in the union movement and in the nation as a whole.

India: corporatism as the captive of uneven pluralism

India is widely acknowledged as one of the oldest and most vigorous pluralist systems in the Third World. That reputation was enhanced considerably by the stunning and decisive electoral rejection of Indira Gandhi's effort to extend her 'emergency government' of 1975–7 into a more lasting experiment with state corporatism. Yet it is clear that Mrs

²⁹ *ibid.*, pp 63–4, 69–70.

Gandhi's corporatist policies were largely an attempt to build upon and to consolidate a pre-existing base of corporatism that had developed within the fabric of India's more dominant pluralist traditions, especially since her assumption of the prime ministership in 1966. Moreover, Mrs Gandhi ultimately was deterred from her authoritarian enterprise not so much by the strength of popular commitment to democracy as by her own sober assessment of the endless and insurmountable problems of penetrating and restructuring India's vast, multi-layered associational universe and of bending it to her own purposes.³⁰

Mrs Gandhi soon discovered that corporatising initiatives were most successful where modern pluralist structures were most developed and that corporatisation was particularly futile where associational life remained elusive and mercurial because of its persistently amorphous, personalistic, transient, and informal character.³¹ In this sense, the very weakness and unevenness of Indian pluralism proved to be its best defence against the corporatist strategy of a determined but over-ambitious centraliser. Similarly, by accentuating and making more manifest the corporatist features of the Indian polity, Mrs Gandhi indirectly contributed to the invigoration and greater consolidation of some of the country's most fragmented and impotent pluralist associations—the national union confederations.

The emergency regime culminated nearly a full decade of steady erosion in India's democratic institutions that accompanied Mrs Gandhi's centralisation and personalisation of power and the growing bitterness of her attacks on the 'selfish, divisive, and undisciplined' nature of pluralism. By the time the Allahabad court tried to ban her from political activity she had weakened virtually all of the formal, institutional checks on her authority including the cabinet, the traditional leadership of the Congress Party, the federal system, and of course the very judiciary that vainly sought to terminate her rule. Mrs Gandhi's decision to confront and subdue her remaining opponents undoubtedly was facilitated by public despair over the lingering effects of a costly war, the oil crisis, and poor harvests as well as by her evident appeal to anti-democratic quarters that were otherwise antagonistic to

one another, such as Hindu nationalists and revolutionary socialists.³²

However, the deeper basis of her assault on pluralism lay in her expectation (or, more accurately, her gamble) that the combined organisational resources of the state and the ruling party had reached at last a level that would permit effective control over economic and associational life.³³ Such an objective may not have appeared at all beyond reach given the extensive network of corporatist arrangements that already had been fashioned with many organised interests by a nation-wide party apparatus enjoying nearly three decades of uninterrupted incumbency and by a central government apparatus that had become the principal planner, investor and employer in the modern sector of the economy. In many cases it must have seemed that a transition to state corporatism would require not the demolition and thorough recasting of existing representative structures, but merely their appropriation, unification and subordination.

In fact, the impact of the emergency measures on Indian society was highly differentiated and uneven. To a surprising extent the contours of the new corporatism formed a mirror image of the old pluralism—most solid among the urban middle class of civil servants, professionals and businessmen; substantially less coherent and effective in the labour movement; hopelessly decentralised and uncontrollable in the agricultural sector; and nearly incapable of reaching the poor and unemployed for whose benefit the experiment supposedly was intended in the first place.

The greatest conversion of multiple voluntary associations into a party-guild complex of nominated bodies and 'national forums' occurred among the modern professions, especially those that had come to depend heavily on government employment and regulation. Journalism was particularly affected as competing news agencies were merged into a single state-run organisation supervising a new system of collective self-censorship. Universities were forced to adopt new 'codes of conduct' that restricted publication and travel. Even the free professions which still retained large portions of their memberships in the private sector were highly susceptible to the Congress Party's herding strategy and the state's drive for tighter regulation.³⁴

Equally strong, though far more reciprocal, ties were formed quickly

³² Morris-Jones, *op. cit.*, p. 30.

³⁴ Morris-Jones, *op. cit.*, pp. 31-3.

with businessmen's associations. Although merchants commonly complained about new price controls, private industrialists were delighted by freer credit and licensing, lower taxes and government intervention in labour relations. Mrs Gandhi's promotion of joint enterprises between state and private investors consolidated ties between the dominant actors in India's mixed economy and put important new public resources at the disposal of private capitalists.³⁵ Indeed the new system of corporatist representation involved a growing intimacy with and generosity toward big business that clearly belied the redistributive rhetoric which the prime minister so consistently invoked to justify her declaration of an emergency regime. This swing to the right was eloquent testimony to Mrs Gandhi's rapid adaptation to the limitations inherent in any effort to transform the highly skewed distribution of associational resources that had been inherited from the preceding pluralist era.

The obstacles to corporatisation were most formidable in the countryside where associability continued to be structured primarily in traditional forms or where it lacked permanent and formal organisation altogether. Local landholders tolerated Congress Party 'observers' from Delhi who took over the official bodies of local government to establish new groups and programmes with mild redistributive overtones. But when the central government attempted to remove control of farm policy from the states as it had done in other fields such as education, the proposal was easily defeated by agricultural interests fearing new tax increases. The personal and clientelistic hierarchies of landed notables were not challenged by new externally sponsored groups. Yet by retaining a powerful presence in elected assemblies and party organisations at both state and national levels, the larger landholders could challenge any initiative threatening the agricultural sector or their privileged position within it.³⁶

Among the rural poor a great deal of associational activity was channelled through informal, ephemeral or illegal groups such as caste associations, language communities, land grab movements, and moral revivals. These kinds of amorphous structures were undoubtedly well-suited to protest and agitation, but they did not possess the sort of organisation that could be annexed and manipulated (or in many cases even identified) by the state.³⁷ In view of Mrs Gandhi's reluctance to

³⁵ Rudolph and Rudolph, *op. cit.*, 387-8 and Stanley A Kochanek, *Business and Politics in India*, Berkeley: University of California Press, 1974, chs 7 and 8.

³⁶ Rudolph and Rudolph, *op. cit.*, pp 382, 389.

³⁷ *ibid.*, pp 389-90.

provide the poor with any new associational alternatives and her increasing tendency to seek accommodation with already entrenched interests, it is hardly surprising that rural voters overwhelmingly supported terminating the emergency regime and restoring pluralist autonomy.

In the case of the labour movement the impact of corporatism was more interesting. Although it was not as successful here as with middle class and business groups, neither was it as irrelevant as with rural and agrarian groups. The government established bipartite councils in large industrial firms supposedly to encourage worker participation in management, but more immediately to help implement longer work-weeks, lay-offs, and wage freezes. These councils then were organised in National Apex Bodies where employers met for industry-wide talks with representatives of the competing union confederations.³⁸ Even though these rudimentary efforts at economic summitry occurred within a larger context of union repression they provided a rare opportunity and incentive for labour leaders to collaborate with one another and to lessen their traditional dependence on brokers and intermediaries in rival political parties.

For decades Congress Party politicians had pursued a fragmenting and disorganising strategy toward the labour movement designed to weaken an important sector in which their opponents' strength consistently equalled or surpassed their own.³⁹ Before independence Congress had been unable to displace the communist leadership of the All-India Trades Union Congress and so in 1947 it created a competing organisation that gradually acquired privileged and at times semi-official status. Soon another major confederation arose under socialist leadership. Then, in 1970, after Mrs Gandhi split the Congress Party and allied with the communists, a fourth union group was formed by left-wing communists who rejected the coalition. Intense rivalry between these and several smaller groups was fostered by labour legislation that preserved multiple union representation in individual enterprises while discouraging collective bargaining in broader sectoral or regional units. This resulted in a persistent inability of unions to defend workers' interests and a long-term stagnation of real wages that, of course, were perfectly compatible with the dominant forces in the Congress Party's regional organisations.

³⁸ *ibid.*, p 388.

³⁹ Rakaharai Chattopadhyay, 'The political role of labor unions in India: an interstate study of labor unions in West Bengal, Karnataka, and Rajasthan', PhD dissertation, University of Chicago, 1975, ch 1.

Given this long history of debilitating pluralism the temporary introduction of corporatist measures was not at all inconsistent with labour leaders' efforts to shape a more cohesive union movement with a greater voice in economic policy-making. After Mrs Gandhi's solid electoral defeat in 1977 her successors retained the National Apex Bodies even while reviving earlier tripartite commissions that had fallen into disuse.⁴⁰ Thus the labour movement can be seen as a specific instance of the broader national pattern in which Mrs Gandhi's experiments with state corporatism, limited and frustrated by the incoherence of Indian pluralism, also contributed to pluralism's consolidation and revitalisation.

Conclusions and speculations

In conclusion we can try to identify some common themes concerning the most likely motivations and consequences of these ill-fated experiments with 'unruly corporatism'. Regarding the question of causation, certain 'Latin American' paradigms are relevant, especially those connecting state corporatism with crises arising at various stages in dependent capitalist development and during major attempts either to co-opt or to smash organisations of the working class. There is an undeniable resonance throughout the Middle East and Asia of such common 'semi-peripheral' themes as strengthening the state, suppressing conflicts of interest between organised socio-economic groups, fashioning new alliances with foreign sources of capital and technology, and making the big push toward economic growth the primary goal if not the exclusive definition of modernisation. Nevertheless, while these 'world system' and political economy factors must form a part of any explanation, they are only a part and by no means a determinative one.

Outside Latin America it is difficult to point to incidents of state corporatism as authoritarian responses to the threat of a powerful and radicalised 'popular sector', or to the irresistible demands of a hegemonic national bourgeoisie, or to the extreme polarisation and imminent collision of the two. Apart from Turkey and the Philippines there are very few prospective Argentinas or Chiles in the Middle East and Asia. In most other Third World countries industrialisation is less advanced and privately controlled, modern class structures are less

⁴⁰ Rudolph and Rudolph, *op. cit.*, pp 390-1.

crystallised and rigidified, and foreign economic commitments are less massive and irreversible. Accordingly, state corporatism appears to be more a choice and initiative of fairly autonomous elites than a necessary or reluctant response to forces beyond their control.

Indeed, it may be the notion of the 'autonomy of the state'—so celebrated in both the neo-Marxist and neo-conservative writings that currently dominate the field of political development and so trivialised in earlier liberal writings—that is at the heart of the matter. Why are so many authoritarian modernisers willing to exchange previously acceptable and often quite effective forms of political domination for riskier and unreliable alternatives when they are under no clear compulsion to do so? More specifically, why are they so eager to abandon the hegemony afforded by flexible heterogeneous associational systems which tolerate a certain manoeuvrability for weak opponents and to pursue instead the phantom of modernised despotism by investing scarce resources in the repressive construction of more comprehensive and coherent state corporatist systems?

The cases examined here suggest three interrelated factors each of which has promoted exaggerated (one is tempted to say obsessive) efforts to enhance the autonomy of the state *vis-à-vis* civil society: 1) unbounded personal ambition; 2) infatuation with new foreign models in which corporatism is seen as part of an instant recipe combining 'economic miracles' with 'social peace'; and, 3) the misfortune of relying on the unwise counsel of many in the discipline of political science where corporatism has been vastly oversold whether as an analytical concept or as an associational policy.

The four heads of government considered here were particularly vivid examples of political autonomy feeding upon itself. All were animated by an inexplicable certainty and fatal conviction that they could bend society to their own wills. All were prone to enterprises of such extravagance and misjudgments of such magnitude that it was their intimates more often than their distant enemies who pointed to signs of mental imbalance.

None of these regimes was much inspired in recent years by the 'classical' models of capitalist or socialist development. No matter how much the United States and the Soviet Union have succeeded in reviving and universalising the Cold War, they have not been able to re-establish credible images of themselves as products of alternative historical processes that are relevant and accessible to modernising elites today. The most attractive and seriously regarded models of

development in the Third World now are not the nations at the top of the heap, but those *near* the top, especially if they achieved that position despite considerable resistance and hostility from their more powerful forerunners.

Japan and Brazil, West Germany and Italy, OPEC and the 'gang of four' are much more likely to be cited as achievable precedents in the economic plans and patriotic rhetoric of the Middle East and Asia. As elites in these countries have looked more to the 'late developers' of Europe and Latin America and, naturally, to one another, they have been more likely to (mis)perceive the modernisation of authoritarianism as the key to modernisation in general. This has paved the way for a proliferation of state corporatist experiments as authoritarians in more and more countries 'rediscover' or simply invent political beliefs and institutions they regard as instrumental in replicating earlier success stories.

Highly ambitious and often unattainable projects to reshape associational life from above also have been encouraged by the more frequent reading and misreading in the Third World of the burgeoning social science literature on corporatism. In Egypt, for example, a spirited debate over the reform of representative institutions tends to crystallise around competing pluralist versus corporatist positions each of which seeks to justify itself not only by appealing to particular native traditions and social constituencies, but also by invoking foreign scholarly opinion. Bemused television audiences were treated to more than one seminar in which President Sadat himself explained to the People's Assembly that modern political science had established beyond doubt the need for strict limitations on the number of parties and interest groups if developing democracies were to become 'institutionalised'. Similarly, in Iran the role of this sort of diffusion in promoting an attempted overhaul of the authoritarian regime is well known. Was the Shah so wrong when, observing Nasser, he instinctively equated corporatism with political upheaval? Was he better guided by the expert opinion of his American-trained advisers who, newly returned with their doctorates in political science, inspired the escapades of the Resurgence Party?

Finally, regarding the consequences of these unsuccessful state corporatist experiments, two recurrent outcomes are particularly noticeable: 1) an initial rise in political opposition causing greater instability and 2) a gradual strengthening of pluralist forms of representation. Instability appears to be considerably more severe and

protracted where associational life historically was repressed and retarded as in South Korea and especially Iran. Alternatively, the prospects for a more vigorous pluralism are most evident where the art of association was widely cultivated in previous historical periods, regardless of whether this occurred through primarily pluralist means as in India or through primarily corporatist means as in Egypt.

This suggests that if we want some idea of what to expect after an unruly corporatist system has been deeply shaken or overturned, we need to look carefully at what happened before it was created. In Egypt and India, where associability was stronger historically, elites responded to crises of unruly corporatism by fashioning more flexible and heterogeneous systems that combined both corporatist and pluralist elements. Mubarak preserved corporatist authoritarianism, but developed a new tolerance (indeed, some say weakness) for interest-group bargaining and partisan competition. The Janata government restored pluralist democracy, but retained some of Mrs Gandhi's innovations to reduce fragmentation in the labour movement and to strengthen the state's ties with big business. Contrastingly, in South Korea and Iran, where associability in general had far weaker roots, crises of unruly corporatism were followed by even more intense elite hostility toward opposition groups whatever their organisational form.

Namibia: the relevance of international law

International lawyers often wonder whether international law really is law. That is, whether, considering the anarchic features of the international system, legal regulation can effectively control the behaviour of states. There are certainly many examples in the contemporary world which illustrate the shortcomings of international law, but unfortunately none is better than that of Namibia. For Namibia, one of the first colonies to become a matter of international concern more than sixty years ago, is today still under the yoke of colonialism even though the inalienable right of its people to form an independent state is today universally recognised. Moreover, since 1966 South Africa has been occupying Namibia in contravention of innumerable resolutions by the Security Council and the General Assembly which were declared to be binding by the International Court of Justice in its 1971 Advisory Opinion.¹ South Africa's defiance of international law and of the authority of the UN is all the more shocking because the acts it is perpetrating against Namibia include three of the most serious international crimes, characterised as such by the International Law Commission:² aggression against a country's territorial integrity; suppression of a people's right of self-determination; and imposition of the infamous policy of apartheid. Yet, despite the seriousness of these offences, the UN has not yet taken effective measures against South Africa, thus prolonging a situation which, apart from constituting a major breach of international peace and security, greatly undermines the authority of international law throughout the world.

This article—though not attempting to answer the broader question concerning the role of international law in the contemporary world—argues that the political and military struggles for Namibia's independence have a legal dimension which is important and should not be ignored. One should not be deluded into believing that international

¹ *Legal Consequences for States of the Continued Presence of South Africa in Namibia (South West Africa) notwithstanding Security Council Resolution 276 (1970)*, Advisory Opinion, ICJ Reports 1971, p. 16.

² International Law Commission, 'Draft articles on state responsibility', *International Legal Materials* (18) 1979, pp. 1568–77.

law alone can secure the decolonisation of Namibia. Yet, it would be a mistake to regard it as mere rhetoric designed solely to justify and conceal political and economic interests. In this article I show how during the long period that Namibia has been on the agenda of the international community, there developed a legal consensus which is unequivocally on the side of Namibia's independence. I then explain the contemporary relevance of this consensus and the importance it will have in the future when the government of an independent Namibia seeks compensation for the international delicts and crimes committed against its people and territory. Finally, after outlining the UN's Plan for Namibia's independence, I show how South Africa and its allies have tried—so far unsuccessfully—to undermine this legal consensus in the current negotiations.

Namibia within the UN—an overview

Namibia, a German colony since 1884, acquired international status in 1919 when Germany renounced at Versailles all its rights over the Territory.³ The following year it became a territory under Mandate and its administration was entrusted to South Africa under the supervision of the Council of the League of Nations. The Mandate system was based on the principle that the administering state did not acquire sovereign rights over the territory (principle of non-annexation) and that the administration of the territory had to be conducted in accordance with internationally controlled standards so as to promote the well-being of the inhabitants of the territory (principle of the sacred trust of civilisation).

The demise of the League of Nations did not affect Namibia's status as an international territory. In 1950, the International Court of Justice determined that South Africa continued to have obligations under the Mandate and that the supervisory functions concerning the administration of the Mandate were to be exercised by the UN General Assembly.⁴ But South Africa, taking advantage of the fact that Advisory Opinions are not binding, refused to accept the Court's interpretation, claiming that after the demise of the League of Nations, it no longer had any legal obligations under the Mandate. After the Court's Advisory Opinion the General Assembly tried by every possible

³ For some interesting materials on the Mandate see, J Dugard, *The South West Africa-Namibia Dispute*, Berkeley: University of California Press, 1973, pp 27-88.

⁴ *International Status of South West Africa, Advisory Opinion, ICJ Reports 1950*, p 128.

means to persuade South Africa either to accept supervision over the Mandate or to transform the Mandate into a trust territory in accordance with Chapters 12 and 13 of the UN Charter. But these efforts were unsuccessful. Thus, the General Assembly was not able adequately to supervise the administration of the Mandate because South Africa did not submit reports on its administration and did not allow visits to the Territory by UN bodies.

In 1955 and 1956 the International Court of Justice handed down two further Advisory Opinions which, apart from clarifying some procedural matters relating to the supervision of the Mandate, again confirmed that South Africa had a legal obligation to accept UN jurisdiction over the Mandate.⁵ These two further interventions also failed to persuade South Africa to change its policy so the Assembly had to consider other measures to ensure that South Africa fulfilled its obligations under the Mandate. Thus, the Assembly drew to the attention of its members the legal action provided for in Article 7 of the Mandate, which allowed former members of the League of Nations to institute contentious proceedings before the International Court of Justice against South Africa.⁶ Ethiopia and Liberia, pursuing this idea, instituted proceedings in November 1960 against South Africa with the objective of obtaining a binding judgment from the Court which would declare that not only had South Africa breached its obligations under the Mandate, but that it was bound to accept UN supervision over its administration. In 1962, the Court rejected several jurisdictional objections raised by South Africa, deciding that it had jurisdiction to adjudicate upon the merits of the dispute.⁷ However, in 1966, after hearing the arguments on the merits of the case, the Court unexpectedly reopened the jurisdictional question, deciding that Ethiopia and Liberia had not established any legal right or interest in the subject matter of the case.⁸ The Court's judgment, adopted by the President's casting vote—the President voting twice because the votes were equally divided—was strongly criticised in legal and political circles. However, its immediate effect was positive since it forced the General Assembly to reassess its policy on Namibia.

Having considered that all efforts to persuade South Africa to fulfil its obligations under the Mandate had been exhausted, the General Assembly decided in October 1966 to terminate the Mandate, declaring that Namibia came under the direct responsibility of the UN. The following year, the Assembly created the UN Council for Namibia to administer the Territory, but the Council could not establish a presence there because South Africa refused entry.⁹ Thus, by 1967, the General Assembly had again reached a political deadlock. However, by this time conditions in Namibia had changed. SWAPO had launched the armed struggle for independence, thus giving notice to the UN that the Namibian people would continue to fight for the liberation of their territory regardless of whether the international community assisted them.¹⁰ South Africa, for its part, intensified political repression to prepare the ground for the implementation of the homelands policy, which was designed to fragment and divide the people of Namibia.¹¹ This fact prompted the intervention of the Security Council.

In 1967 South Africa applied the recently enacted Terrorism Act to the territory of Namibia. This decision brought about a hostile reaction from within the UN not only because after the termination of the Mandate South Africa had no right to legislate for the Territory, but also because the new Act was retroactive and of a particularly repressive nature. Moreover, South Africa implemented the Act in a provocative manner by staging a trial in Pretoria against thirty-seven SWAPO members. The General Assembly called for the immediate release of the Namibians concerned, and this call was reaffirmed by the Security Council in Resolution 245 adopted in January 1968. In March the Security Council demanded the immediate release of the Namibians convicted by the Court in Pretoria at the end of the trial.¹² This new Resolution also warned South Africa that in the event of non-compliance the Security Council would meet immediately to determine effective measures in accordance with the provisions of the UN Charter.

Between 1969 and 1971 the Security Council adopted several important Resolutions on Namibia.¹³ By these Resolutions the Security

Council recognises the legitimacy of the struggle of the Namibian people against South Africa's occupation, reaffirms the legal responsibility of the UN over the Territory, declares all acts taken by South Africa on behalf of Namibia since the termination of the Mandate to be illegal and invalid, and calls upon all states to refrain from all dealings with South Africa that imply recognition of the illegal occupation. The binding nature of these Resolutions was confirmed by the International Court of Justice in its Advisory Opinion of June 1971, which determined that South Africa is under obligation to withdraw from Namibia and that all states have a duty to recognise the illegality of South Africa's presence there and to assist the UN in its policy towards Namibia.¹⁴ In October 1971 the Security Council endorsed the operative paragraphs of the Court's Advisory Opinion and clarified that all states have individual responsibilities towards the people of Namibia and that in the discharge of those responsibilities they must abstain from all relations with South Africa which may entrench the latter's authority over the Territory.¹⁵

By the end of 1971, as it became clear that the Security Council would not take effective measures against South Africa to enforce its Resolutions, the question of Namibia began to lose momentum in the UN. In 1972, to deflect the calls for mandatory sanctions made by an overwhelming majority of states in the General Assembly, the Security Council began direct negotiations with South Africa. These negotiations failed to persuade South Africa to change its position and were formally discontinued by the Security Council in December 1973.¹⁶ Meanwhile, in 1973, as South Africa began to sponsor political groups in preparation for a settlement outside the framework of the UN, the General Assembly recognised SWAPO as the authentic representative of the Namibia people.¹⁷ The following year, the General Assembly endorsed Decree No. 1 of the UN Council for Namibia, which prohibits the exploitation of Namibia's natural resources without the consent of the Council.¹⁸

In December 1974, the Security Council adopted a strongly-worded

¹⁸ General Assembly Resolution 3295 (XXIX) 1974.

Resolution demanding the immediate withdrawal of South Africa from Namibia, warning that, in the event of non-compliance, it would consider taking appropriate measures.¹⁹ Since South Africa refused to comply, a draft resolution calling for mandatory sanctions against South Africa was placed on the Security Council's agenda. This draft resolution won the support of the majority of the members of the Security Council, but could not be adopted since it was vetoed by the United Kingdom, France and the United States.²⁰ These vetoes gave South Africa the confidence to continue its efforts to secure a political settlement outside the framework of the UN. Thus, in September 1975 South Africa announced the opening of a Constitutional Conference to decide the future of Namibia.²¹

Responding to these developments the Security Council adopted a critical resolution, Resolution 385 of January 1976, which, apart from reiterating the demand for South Africa's withdrawal from the Territory, emphatically declared that the UN was to control and supervise elections to determine the future of Namibia. Once again, South Africa's refusal to comply was followed by draft resolutions calling for mandatory sanctions which, as before, could not be adopted because of the vetoes by the United Kingdom, France and the United States.²²

In May 1978, responding to the paralysis of the Security Council, the General Assembly adopted an important Declaration on Namibia.²³ This Declaration stated that if, as a consequence of the vetoes in the Security Council, the UN was prevented from taking effective measures against South Africa, the General Assembly would take the necessary action to end the illegal occupation. But while the General Assembly was considering a change of policy, the three permanent members of the Security Council responsible for the vetoes, together with Canada and the Federal Republic of Germany, began a process of negotiations which culminated in April 1978 with a proposal for a settlement for Namibia. After further negotiations, this proposal was accepted by SWAPO and South Africa, and in September 1978 it was formally endorsed by the Security Council in its Resolution 435.

²³ General Assembly Resolution S-9/2 (1978), paragraph No. 28.

Security Council Resolution 435 is based upon the three main elements which today embody the legal consensus on Namibia: characterisation of South Africa's administration as illegal; recognition that the Namibian people have a right to form an independent state; and acknowledgment that the independence process must take place under the supervision and control of the UN. Resolution 435 has become a durable framework for the current negotiations on the UN Plan for the independence of Namibia.

Legal consensus—background and consequences

The preceding section may give the impression, albeit false, that the question of Namibia followed a logical and uncontroversial evolution through the organs of the United Nations. Indeed today nobody would question that South Africa's occupation is illegal, that the people of Namibia have a right to self-determination and that the UN has a direct responsibility over the Territory. However, in 1945, when the UN was established, the international legal rules applicable to Namibia were far from clear and doubts concerning whether the UN could discuss Namibia, let alone supervise the administration of the Mandate, were not without foundation.

A consensus view on Namibia did not emerge spontaneously; it was the outcome of a slow, oblique and often frustrating process. Four factors account for the eventually successful outcome of this process: determination of the Namibian people, under the leadership of SWAPO, to resist the superior military force of the occupying power; political pressure exerted by some states, mainly the front-line states within the UN; incessant efforts by some non-governmental organisations to maintain the issue of Namibia alive in public debate; and changes in general international law which have resulted in effectively outlawing colonialism as an instrument of state policy. In this section I outline the background of the consensus view on Namibia and point out some of its legal consequences.

Background

On the eve of World War II more than one-third of the people and land of the world were under colonial rule. Although the war weakened the colonial powers, the world was still largely colonial when the UN was created. This is reflected in the fact that the UN Charter did not establish a mandatory regime to supervise the administration of colonial

territories.²⁴ Instead, it created a trusteeship system which applied mainly to the colonies detached from enemy states as a result of the war and to the existing Mandates. The rest of the colonies, comprising more than 80 per cent of all colonial territories, were dealt with in a vague Declaration contained in Chapter 11 of the Charter, which, at the time, was regarded as a promise of good behaviour having no legal consequences. Although Chapter 11 was eventually important in shaping the practice of the UN, leading to the adoption of the General Assembly Declaration on Decolonisation of 1960, it actually took fifteen years for it to come out unequivocally on the side of the anti-colonial movement.

When the UN was created, Namibia stood apart from other colonies because it was a territory under Mandate. But this status, which Namibia could have benefited from, became a liability. In its 1950 Advisory Opinion the International Court of Justice determined that the UN had the right to supervise the administration of the Mandate, but unfortunately it also concluded that South Africa did not have a duty to place the territory of Namibia under the trusteeship system. In practical terms this meant that, since South Africa refused to accept the trusteeship system, the UN had to set up a special machinery, similar to that used by the defunct League of Nations, to supervise the administration of the Mandate. This interpretation opened up an interminable debate in which South Africa and its allies raised innumerable legalistic objections to every effort by the General Assembly to discharge its responsibilities towards Namibia, thus indirectly justifying South Africa's non-compliance.²⁵

Towards the end of the 1950s, the legal issues surrounding the Mandate had become so complex that it seemed as if Namibia's liberation from colonialism depended upon the solving of obscure and largely irrelevant points of law. The Mandate had in fact become Namibia's straitjacket. But this was to end when in 1960, after adopting the Declaration on Decolonisation, the General Assembly placed the question of Namibia firmly on the agenda of decolonisation, thus restoring a proper perspective to United Nations debates on Namibia.²⁶

The Declaration on Decolonisation, approved by the General Assembly in December 1960, was a turning point in the history of the

²⁶ General Assembly Resolution 1514 (XV) 1960.

UN. The Declaration proclaimed the right of self-determination of all dependent peoples, called for a speedy end to colonialism, and declared that all armed action and repressive measures against dependent people must end. This Declaration, a consequence of changes in UN membership, marked the beginning of a more active role by the organisation in the decolonisation process. Thus, the General Assembly developed a set of principles to identify colonial territories, declared that all states administering such territories had a duty to submit their administration to the scrutiny of the UN, and to this effect, it established a special committee (Committee of 24) to ensure that the Declaration on Decolonisation was promptly implemented.²⁷

This new international law of decolonisation greatly contributed towards shifting the focus of the UN debate on Namibia. Indeed, from 1960, the General Assembly began to abandon its obsession with legal technicalities of the Mandate, concentrating instead on the central question of Namibia's independence. Consequently, by 1966 the rapid evolution of the right of self-determination of colonial peoples had already rendered the Mandate obsolete. Thus, the termination of the Mandate by the General Assembly—a decision fully justified in as far as the legality of the Mandate is concerned—was above all an acknowledgement that the Mandate was no longer an adequate vehicle to secure Namibia's independence.

Consequences

Namibia is perhaps the clearest case of a unit entitled to exercise the right of self-determination. It has had an international status for more than sixty years and its people and territory are well defined. Two important consequences derive from this: on the one hand, every single act or omission by South Africa—as well as by other states—which impedes the exercise of the right of self-determination of Namibia is an internationally wrongful act; on the other hand, the people of Namibia have a right to resist any action which deprives them of their right of self-determination, and to this effect are entitled to seek and receive support from other states.

After the termination of the Mandate, the UN continued its responsibilities since termination did not change the international status of the Territory. However, by 1966 the meaning of the principle of the sacred trust—one of the pillars of the Mandate system—had changed

²⁷ General Assembly Resolutions 1541 (XV) 1960 and 1654 (XVI) 1961.

from a paternalistic conception of tutelage exercised over 'peoples not yet able to stand by themselves' to the contemporary notion of self-determination and independence.²⁸ Accordingly, the General Assembly decided to assume the Territory's administration directly, with independence as its objective. To this effect it established the UN Council for Namibia, entrusting it with the necessary powers to administer the Territory until independence. However, South Africa's illegal occupation has so far prevented the Council from entering Namibia.

The UN Council for Namibia is today the only authority legally empowered to administer and represent Namibia.²⁹ Consequently, as stated in Security Council Resolution 276 (1970), all acts taken by South Africa on behalf of, or concerning, Namibia after the termination of the Mandate are illegal and invalid; and any kind of relation concerning Namibia can only be entered into or maintained through the Council. Member States of the United Nations have a duty to recognise and assist the Council for Namibia because it is discharging a responsibility that belongs to the UN. Because the Council for Namibia has been prevented by South Africa from entering the territory, its acts cannot, for the time being, be enforced inside Namibia. However, as the lawful authority of the Territory it has the duty to safeguard the interests of Namibia by every means available. To this effect, in September 1974, the Council enacted Decree No. 1 for the protection of Namibia's natural resources.

Decree No. 1 is a domestic law of Namibia designed to take effect outside Namibia. It prohibits the exploitation of Namibia's natural resources and provides for the seizure and forfeiture of any such resource which is removed from the territory. This Decree can be enforced through the municipal courts in the territory of states where Namibian natural resources are found. These courts should give effect to the Decree not only because it was promulgated by the lawful authority of Namibia, but also because it embodies the international public policy of safeguarding the interests of the Namibian people. The Decree will soon be tested in the courts of The Netherlands, where the UN Council for Namibia is to commence legal proceedings against Urengo, a company involved in processing Namibian uranium in

²⁸ For an authoritative statement on the transformation of the principle of the sacred trust, see *ICJ Reports 1971*, p. 31.

²⁹ See generally S C Saxena, 'Role of the United Nations Council for Namibia', *African Quarterly* (17) 1978, pp 5-31.

contravention of Decree No. 1. This legal action is the first of several measures which the Council is taking to secure compliance with Decree No. 1.³⁰

Decree No. 1 is not a rule of international law.³¹ However, states are bound by its content because the Decree spells out the legal consequences of South Africa's occupation of Namibia in the critically important area of natural resources. In several binding Resolutions, the Security Council has called upon states to refrain from any dealing implying recognition of South Africa's illegal occupation of Namibia.³² Thus, to the extent that trade in Namibian resources requires some level of official activity on the part of the importing state this constitutes a violation of international law, as well as a violation of Decree No. 1. The importation of Namibian uranium into the European Community is a case in point. Because all contracts for the supply of uranium into the Community are signed by the relevant organ of EURATOM, all Member States of the European Community are involved in a serious breach of international law.

The consensus view on Namibia which emerged after more than thirty years of debate in the United Nations has important legal implications. First, it guarantees that the UN will not recognise any group other than the genuine representatives of the Namibian people as subjects entitled to exercise the right of self-determination. Second, it provides the basis for the claim of compensation which the government of an independent Namibia will be entitled to make against South Africa for the innumerable crimes and abuses perpetrated against its people and for the illegal occupation of its territory. Third, it provides the framework to assess the behaviour of those states which, in breach of their clearly stated international obligations, give effect in their territories to illegal acts of the occupying power in Namibia. Fourth, it makes it possible to protect Namibia's natural resources through the

³⁰ The decision to take legal action against Ureenco was announced by the UN Council for Namibia on 3 May 1985. For an interesting analysis of the illegal trade on Namibian uranium see: A Roberts, *The Rossing File*, London: Namibia Support Committee, 1980.

³¹ This is not a view shared by all international lawyers. Some argue that the Decree is indeed a binding rule of international law, while others deny that the Decree has any legal force whatsoever. For a good summary of this debate see: N.J. Schrijver, 'The status of Namibia and of its natural resources in international law', in UN Council for Namibia, *Regional Symposium on International Efforts to Implement Decree No. 1 for the Protection of the Natural Resources of Namibia*, New York, 1985, pp. 17-52. This publication can be obtained free of charge from the Office of the UN Commissioner for Namibia in New York and from UN Information Centres throughout the world.

³² Security Council Resolutions 269 (1969), 276 (1970), 283 (1971) and 301 (1971).

implementation of Decree No. 1 outside Namibian territory. And fifth, it provides that individuals and companies that today take advantage of South Africa's illegal occupation are liable to pay compensation to the future government of an independent Namibia and that their home states cannot afford them diplomatic protection.

The important consequences arising from the prevailing legal consensus on Namibia explain why South Africa and its allies are so determined to undermine it in the current negotiations.

A challenge to the legal consensus

The UN Plan for independence

The UN Plan for the independence of Namibia is contained in Security Council Resolution 435 (1978), which also incorporates the settlement proposal made by the Contact Group in April 1978 and various reports by the Secretary-General.³³ The objective is to secure the withdrawal of South Africa's administration and the transfer of power to the Namibian people through elections supervised and controlled by the United Nations. The Plan is to be implemented in various stages beginning with a ceasefire agreement between South Africa and SWAPO and culminating with the adoption of a Constitution by an Assembly elected in free and fair elections held for the whole of Namibia as one political entity. To assist in the implementation of the Plan, Resolution 435 established a United Nations Transition Assistance Group (UNTAG). This is a unique operation with military and civilian components and comprising nearly 9,000 personnel of which 20 per cent are civilian. UNTAG is under the direction of the Secretary-General and operates under the overall authority of the Security Council.

Negotiations for the implementation of the UN Plan have now been going on for more than seven years.³⁴ During this time, South Africa has continued to use force against the liberation movement of Namibia and has committed several acts of aggression against neighbouring states. At the negotiating table, South Africa has shown no signs of being seriously interested in implementing the UN Plan, but instead had used the

³³ UN Doc. S/12636 (10 April 1978), UN Doc. S/12827 (29 August 1978) and UN Doc. S/13862 (31 March 1980).

³⁴ For a recent analysis of the legal aspects of the negotiations see H J Richardson III, 'Constitutive questions in the negotiations for Namibian independence', *American Journal of International Law* 78(1) 1984, pp 76-120. For an interesting comparison with the case of Zimbabwe see R F H Austin, 'Namibia and Zimbabwe: decolonisations and the rule of international law', *Current Legal Problems* (35) 1982, pp 203-31.

negotiations to play for time in an effort to discredit the UN and to legitimise its presence in the Territory. In this way, it is attempting to prepare the ground for an independence settlement outside the framework of the UN and without the participation of SWAPO. Thus, during the course of the negotiations, South Africa, with the support of some members of the Contact Group, has raised several issues which attempt to challenge the hard-won legal consensus on Namibia. This section examines three of these issues: impartiality of the UN, the shaping of the Constitution of the future independent Namibia and the linking of Namibia's independence with other political matters affecting the region.

Impartiality of the UN

The question of UN bias, a familiar theme in South African propaganda since 1945, was raised by South Africa early on in the current negotiations. Indeed, by mid-1980, as agreement was being reached on most of the technical issues relating to the implementation of the UN Plan, South Africa began to argue that the UN could not play a neutral role, thus creating an impasse in the negotiations. According to South Africa, the UN cannot be expected to play such a role because it is at the same time 'the most ardent protagonist of SWAPO, which is one of several parties contending for power in the Territory.'³⁵ In its view, the decision of the General Assembly to proclaim SWAPO as the sole and authentic representative of the Namibian people justifies the assumption 'that UNTAG will be a stalking-horse for SWAPO.'³⁶

Although South Africa's argument raises an important point about the implementation of the UN Plan, it is based on a misconception about the overall role of the UN in the question of Namibia. With regard to the issue of implementing the independence Plan, the UN has always accepted the principle of impartiality, but has also clarified that this principle does not place South Africa on an equal footing with the UN. According to the UN, impartiality has two aspects: those undertakings which the UN might require of South Africa so as to ensure the impartial discharge of its obligations under the settlement proposals; and those which the UN would wish to adopt in order that its impartiality as the supervisor of free and fair elections would be manifest.³⁷ However, the impartiality of the UN during the implementation of the Plan does not

³⁵ UN Doc. S/14139 (29 August 1980).

³⁶ *ibid.*

³⁷ UN Doc. S/14266 (24 November 1980)

entail an abdication of its responsibilities relating to Namibia. The UN is not and cannot be neutral for its main objective concerning Namibia is to end South Africa's illegal occupation so as to secure the country's independence.

It should be noted that the recognition of SWAPO by the General Assembly is an acknowledgement of its overwhelming support inside the Territory and was prompted by South Africa's attempt illegally to manipulate Namibia's internal politics in its efforts to achieve an internal settlement. In this respect, SWAPO has indicated that as soon as South Africa signs a cease-fire agreement it will be for the people of Namibia, through free and fair elections, to decide who will be their genuine representatives. Moreover, South Africa's argument about UNTAG does not take into account the fact that UNTAG was established by the Security Council, an organ in which South Africa has powerful friends.

Constitutional proposals

In January 1981, a pre-implementation meeting convened by the Secretary-General of the UN was held in Geneva. At this meeting the two parties to the conflict were represented: the people of Namibia by SWAPO's President, Mr Sam Nujoma, and South Africa by the Administrator-General, Mr Danie Hough. The meeting was also attended by observers representing the front-line states, the Contact Group, the OAU and Nigeria. The aim of the meeting was to break the barrier of distrust between the parties and to agree on a date for a cease-fire so as to achieve Namibia's independence before the end of 1981.

At this meeting UN officials explained technical aspects relating to the operation of UNTAG and the role of the Secretary-General in the implementation of the independence plan. SWAPO's delegation expressed its willingness to sign a cease-fire and agree to a date to begin implementation. However, South Africa's delegation, despite earlier assurances to the contrary, again raised the question of impartiality thus causing the meeting to collapse.³⁸

After the failure of the pre-implementation meeting the Security Council was convened to consider the imposition of economic sanctions against South Africa. However, once again, the Security Council was unable to act because of the negative votes of the UK, France and the

³⁸ UN Doc S/14333 (19 January 1981).

US, thus causing great dismay among the majority of states in the UN. In order to divert attention away from the vetoes, the Contact Group announced in May 1981 it would introduce a set of proposals for constitutional arrangements to establish an understanding 'among all the parties about the shape of the future independent Namibia'.³⁹ The Contact Group proposals were eventually announced in September 1981, after the new administration of President Reagan had begun implementing its policy of 'constructive engagement' in Southern Africa. This new American policy gives absolute priority to South Africa's alliance with the West and seeks to diminish, at all costs, what is perceived as growing Soviet influence in the region.

The constitutional proposals provide that Namibia will be a unitary state with a written Constitution.⁴⁰ That it will have three branches of government: an executive, elected by universal suffrage; a legislature, with the responsibility for making and approving all laws; and a judiciary, with the power to interpret the Constitution. According to the Contact Group proposals, the Constitution will guarantee basic rights, and courts of law will be entitled to adjudicate and enforce them. Equal access to every level of public administration will also be guaranteed. The Constituent Assembly will approve the Constitution by a two-thirds majority.

The Contact Group proposals can be analysed from two angles: their substance and their legal status. In terms of their substance, the proposals contain a somewhat vague restatement of well-known principles of liberal democracy and, as such, may provide the basis for a fruitful academic debate. However, in terms of their status, insofar as these proposals purport to determine the shape of the future Namibian state, they only express a political aspiration and have no concrete legal significance and no binding force whatever.

The Constituent Assembly, Namibia's first sovereign organ, cannot be bound in advance by rules elaborated in the course of the negotiations. Any attempt to restrict its sovereign powers is null and void under international law. Firstly, because it would constitute a blatant intervention in the domestic affairs of the future sovereign state of Namibia in contravention of the Charter of the United Nations and of well-established principles of international law. Secondly, because it would violate an essential component of the right of self-determination

³⁹ UN Doc. S/14474 (6 May 1981).

⁴⁰ UN Doc. S/15287 (12 July 1982)

which provides that the decolonisation of colonial peoples must be unconditional.⁴¹ And thirdly, because, under the terms of Security Council Resolution 435, the object of the current negotiations is only to secure the transfer of power to the people of Namibia and not to determine the form in which they will exercise their sovereignty.

SWAPO and the front-line states responded with caution to the constitutional proposals. They absolutely rejected the notion that these proposals could be binding on the Constituent Assembly, but accepted them as guidelines. However, they strongly opposed a proposal for an electoral system put forward by the Contact Group.⁴² According to this proposal, members of the Constituent Assembly would be elected by a mixed electoral system: half of its members to be elected by proportional representation on a national basis and the other half on the basis of single-member constituencies.

The approval of an electoral system for a Constituent Assembly is perfectly within the terms of reference of the negotiations, since it would provide the means for effecting the transfer of power to the people of Namibia. However, SWAPO rejected the mixed electoral system because, apart from being extremely complicated to implement, it was regarded as a blatant attempt to prevent SWAPO candidates from winning two-thirds of the seats in the Constituent Assembly. According to SWAPO, the proposal was intended to have the white vote counted as a bloc via proportional representation, while at the same time giving black candidates opposed to SWAPO a chance to appeal for votes on tribal or ethnic bases.⁴³ Instead of this mixed system, SWAPO proposed that it would be willing to accept either one or the other, but not a combination of the two. For its part, South Africa, which had accepted the Contact Group proposal, rejected SWAPO's counter-proposal. Thus, by June 1982 negotiations were blocked over the choice of electoral system.

In October 1983, the Security Council clarified that the electoral system to be used for the election of the Constituent Assembly should be determined before approving the enabling resolution for the implementation of the UN Plan.⁴⁴ The Security Council also called

⁴¹ Paragraph 5 of the UN Declaration on Decolonisation (GA Res. 1514(XV) (1960)) provides that the transfer of power to peoples under colonial domination shall take place 'without any condition or reservations'.

⁴² For SWAPO's position on this and related issues see, 'Pitfalls of Western diplomacy on Namibia', *Namibia Today* 6(2) 1982, pp 6-13.

⁴³ *Ibid.*, p 13.

⁴⁴ Security Council Resolution 539 (1983).

upon South Africa to communicate to the Secretary-General its choice of electoral system to facilitate the immediate implementation of Resolution 435. So far, South Africa has not made up its mind on this question claiming, on the one hand, that this is a highly complex and difficult matter and, on the other hand, that the choice of electoral system will be settled without difficulties as soon as Cuban troops are withdrawn from Angola.⁴⁵

Cuban forces in Angola

After President Reagan took office in 1981, the United States government suggested that the settlement in Namibia should be linked to the withdrawal of Cuban troops from Angola. This suggestion was welcomed by South Africa, but did not gain unanimous acceptance among members of the Contact Group. To gain support for this proposal, in 1982 President Reagan launched a major diplomatic offensive led by Vice-President Bush and by Vernon Walters, the President's personal envoy.

The linkage proposal was immediately rejected by SWAPO and the front-line states, and in 1983 it was unanimously repudiated by the International Conference in Support of the Struggle of the Namibian People for Independence, held in Paris in April 1983 and attended by representatives from 138 states. The Declaration on Namibia approved by the Conference categorically rejects the attempts by the United States and South Africa 'to establish any linkage or parallelism between the independence of Namibia and extraneous and irrelevant issues, in particular the withdrawal of Cuban troops from Angola . . .'⁴⁶ The linkage proposal was also firmly rejected by the General Assembly.⁴⁷

In May 1983, the Security Council called upon South Africa to make a firm commitment as to its readiness to comply with Security Council Resolution 435 and requested the Secretary-General to undertake consultations with the parties to the proposed cease-fire. After visiting South Africa, the Secretary-General reported substantial progress on all aspects concerning implementation of the UN Plan, but pointed out that South Africa continued to insist on the withdrawal of Cuban troops from Angola, thus creating an impasse in the negotiations.⁴⁸

⁴⁵ See UN Doc. S/16219 (22 November 1983) and UN Doc. S/16106 (29 October 1983).

⁴⁶ *Report of the United Nations Council for Namibia*, 38 UN GAOR, Supp. 24, p. 17.

⁴⁷ See General Assembly Resolutions 37/233A (1982) and 38/36B (1983).

⁴⁸ UN Doc. S/15776 (19 May 1983).

Eventually, in October 1983, the Security Council adopted Resolution 539 (by a vote of fourteen to none, with the abstention of the United States) in which the linkage proposal is categorically and rightly rejected on the grounds that it is incompatible with all UN resolutions on Namibia and with the General Assembly Declaration on Decolonisation. This resolution has not yet succeeded in persuading South Africa and the United States to change their minds. After the adoption of this resolution the Contact Group effectively ceased to function.

It is important to note that although the presence of Cuban forces in Angola is irrelevant to settling the question of Namibia, their presence there is perfectly legal under international law. Indeed they are there in response to an invitation made in 1975 by the lawful government of Angola and prompted by the fact that on the eve of independence, South African troops and mercenaries invaded Angola. Since then, South Africa and the US continue to give support to UNITA and other groups which seek to overthrow the government by force. The presence of Cuban troops in Angola is therefore justified in international law on two main grounds: first, they were invited by the lawful government; and second, they are assisting the government of a newly independent state in the exercise of the right of self-determination. Hence, the withdrawal of Cuban forces from Angola should be linked to South Africa's policies in respect to Angola and not to Namibia's independence.

Conclusions

The international community has not yet fulfilled its responsibilities towards Namibia. Nevertheless, over the years, there has developed a legal consensus which has contributed to safeguarding some basic interests of the Namibian people. Thus, so far, the illegal authorities imposed by South Africa in the Territory have not secured international recognition; the linkage proposal has been overwhelmingly rejected; and attempts at curtailing the powers of the envisaged Constituent Assembly have been frustrated. Moreover, after independence this consensus will provide the legal basis for the compensation which is owed to Namibia by all those who, defying the authority of the United Nations and basic principles of international law, exploit the country's human and natural resources.

The legal consensus on Namibia—based on solid principles—is the

product of a long political process. It has provided a durable framework for the current negotiations and has contributed towards safeguarding some basic interests of the people of Namibia. Yet it should not be taken for granted. Law is not immutable. As long as the struggle for independence continues, South Africa and its allies will seek to undermine it. Namibia supporters should therefore not abandon the legal terrain. For despite its shortcomings, international law is playing and will continue to play an important role in the decolonisation of Namibia.

Reluctant compromise on the nuclear arms chase

In September 1985 in Geneva representatives from eighty-eight¹ of the 130 countries who had signed the Nuclear Non-Proliferation Treaty (NPT) met for the third of the five-yearly Review Conferences to evaluate the operation of the Treaty.

The NPT, which came into force in 1970 for a 25-year period, is the world's only multilateral treaty aimed at halting both the spread (horizontal proliferation) and the build-up (vertical proliferation) of nuclear weapons. At its simplest, it may be seen as a bargain whereby the non-nuclear weapon states agree not to develop or acquire nuclear weapons and in return are offered preferred access to nuclear power (and nuclear-based technologies for use in research, medicine and agriculture) plus a firm promise that the three nuclear weapon states who are party to the Treaty, i.e. the US, USSR and UK, will make progress towards nuclear disarmament at an early date, through negotiations undertaken in good faith.

Because of the total lack of any real progress in this latter area the Third Review Conference was viewed with serious trepidation² since it was feared that failure of the nuclear weapon state (NWS) signatories to keep their side of the bargain could mark the beginning of the end of the NPT and the international nuclear non-proliferation regime of which it is the centrepiece. Fortunately, this did not happen. But before considering what actually did occur at the Third Review Conference it is

¹ Ten other non-NPT member-states, namely Algeria, Argentina, Bahrain, Brazil, Chile, Cuba, Israel, Pakistan, Spain and Tanzania attended as observers. In addition, the Palestine Liberation Organisation was granted observer status. Both the United Nations and International Atomic Energy Agency had a formal presence, and the EC's nuclear agency EURATOM, had an informal representation.

important to clarify what the NPT is, what historic processes brought the Treaty about, what are the criticisms of it and what happened at the two previous review conferences in 1975 and 1980.

What is the NPT?

The NPT was drawn up by its three NWS signatory members, the US, USSR and UK—although the UK played a subsidiary role—and signed in July 1968. They became the so-called depository states for the Treaty. It comprises eleven short articles and a preamble. The other acknowledged NWSs, the People's Republic of China and France have not joined, although France claims to abide by the Treaty's provisions. India, which has also proved the technical capability of exploding a nuclear device, is also a non-signatory.

The NPT was negotiated by the superpowers within the framework of the Eighteen Nation Disarmament Committee (ENDC), to which the negotiations were referred, in June 1965, by the UN Disarmament Commission. The original plan for a comprehensive treaty on non-proliferation came from the so-called Irish Resolution to the UN General Assembly in late 1958. The Latin American Treaty of Tlatelolco, negotiated after the Cuban missile crisis confronted the region with a direct nuclear threat, was signed in February 1967 and entered into force in April 1968, just months before the NPT was signed. It declares Latin America a nuclear weapons-free zone and is overseen by the agency OPANAL.

The NPT imposes different obligations on the nuclear weapons states parties than it does on the non-nuclear weapons states.³ The latter are obliged not to acquire or develop nuclear weapons under Article II of the Treaty. Under Article III they agree to accept International Atomic Energy Agency (IAEA) safeguards on all their nuclear activities in order to help to prevent diversion of nuclear material for weapons purposes. The safeguards system is not meant as a policing system as such, rather having its effect by deterring through the fear that any diversion would have a high chance of 'timely' detection.⁴

³ See 'Treaty on the non-proliferation of nuclear weapons: review conference of states parties Geneva 1985', and 'The Non-Proliferation Treaty—Fifteen years after entry into force', *UN Disarmament Fact Sheet* Nos 33 and 41.

⁴ *Background paper on the activities of the IAEA relevant to Article III of the NPT*, prepared by IAEA Secretariat, NPT/CONF/9, June 1985. D Fischer and P Szasz, *Safeguarding The Atom: A Critical Appraisal*, Stockholm: SIPRI, 1985.

The US, USSR and UK are obliged under Article I not to transfer nuclear weapons to any recipient whatsoever. Under Article IV they must assist non-nuclear signatories in the development of nuclear energy for peaceful purposes (other NPT member states with advanced nuclear programmes are also expected to offer assistance). Most importantly, under Article VI the three nuclear weapons signatories commit themselves to make progress towards nuclear and eventually general disarmament. The US, USSR and UK are not obliged to accept IAEA safeguards on their peaceful or military nuclear facilities and there are no limits set on their nuclear weapons programmes beyond the requirements of Article VI, although the preamble to the NPT recalls the determination expressed by signatories of the 1963 Partial Test Ban Treaty (PTBT) to seek to achieve the discontinuance of all nuclear test explosions by the negotiation of a comprehensive treaty.

Article VI has always been seen as one of the most crucial parts of the NPT. Indeed, one of the guiding principles of the negotiations for the NPT was that the Treaty should contain an acceptable balance of responsibilities and obligations for the nuclear and non-nuclear powers. The most important part of the *quid pro quo* between the two is Article VI: 'Each of the Parties to the Treaty undertakes to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament . . .'

Article VI obliges the nuclear powers to do more than conduct negotiations on nuclear disarmament. The understanding of the Parties was that negotiations for nuclear disarmament should produce results. If results were not forthcoming then some or all of the nuclear weapon signatories could not be negotiating in 'good faith'. The non-nuclear signatories made it clear during the Treaty negotiations that without progress towards nuclear disarmament the NPT would not be viable. Some delegations suggested that the failure of the US, USSR and UK to comply with Article VI would constitute justification under Article X for States to withdraw from the Treaty.⁵

As a way of monitoring compliance with Article VI, the non-nuclear states insisted on a Review Conference every five years. The five-year interval was chosen on the assumption that negotiations in good faith would produce agreements worthy of consideration at least every five years.⁶ The nuclear weapon states assured the others that they would

take their obligations under Article VI seriously when opening up the Treaty for signatories in 1968:

- USSR: (on Article VI) 'Never in all of history have states made such a commitment'. (UNGA/C.1/1571 p 14).
- UK: 'I cannot prove (the nuclear powers') sincerity. An act of faith rather than objective data is required. I accept that when they pledge themselves to pursue negotiations in good faith to end the nuclear arms race at an early date they mean what they say.' (UNGA/C.1/1558 p 15).
- US: 'Article VI was added, and then subsequently strengthened, to give further effect to the principle that the Treaty should embody an acceptable balance of obligations. It binds the Parties to end the nuclear arms race at an early date and to seek effective disarmament.' (UNGA/C.1/1568 p 60).⁷

Historical background to the NPT

The original impetus for negotiating the NPT as far as the superpowers were concerned was to prevent 'horizontal proliferation'—the spread of independent nuclear weapons capability to additional countries. Initially, the concern centred around Western Europe and in particular West Germany. Unease grew when France exploded its first bomb in 1960 followed by China in 1964. This resulted in a series of proposals in the UN resulting in the NPT coming into force in 1970.⁸

Despite its limitations,⁹ the NPT was a major step forward and lessened international tension by reducing the Soviet Union's fears that West Germany (which had not yet signed the Treaty) might build nuclear weapons.¹⁰ But the illusion that nuclear proliferation had been

⁷ See Tovish 1985 *op. cit.* for other historic references.

⁸ Shaker *op. cit.* Other useful discussion may be found in W Epstein, *The Last Chance. Nuclear Proliferation and Arms Control*, Free Press, 1975, esp pp 61–8; S Hardman, *The Near Nuclear Countries and the NPT*, Stockholm: SIPRI, 1972; B T Field, 'To be nuclear or not' in *Bulletin of the Atomic Scientists*, May 1967, pp 60–2; 'Completion of the Nuclear Non-Proliferation Treaty, March–July 1968', *Documents on Disarmament*, US State Department, 1969 Collection, pp 51–68.

⁹ India has been an especially vociferous critic of the inequalities encoded in the NPT. Good examples of criticisms of the inequalities of the NPT are found in Epstein (*op. cit.*) and I S Mishra, 'The NPT is not enough for India', *Bulletin of the Atomic Scientists*, June 1968, pp 4–5; H R Vohra, *Bulletin of the Atomic Scientists*, April 1970 pp 25–7; T T Poulou, 'The Third World response to anti-nuclear proliferation strategy', *India Quarterly* 34(2) April 1978, pp 145–57; T Goldblat (ed), *Non Proliferation, the Why and The Wherefore*, 1985(a), Chapters by G Jain and R W Jones on India (pp 89–123) and W X Q and R Drifts on People's Republic of China (pp 43–55).

¹⁰ J Johnson-Freese, 'Interpretations of the Non-Proliferation Treaty: the US and West Germany', *Journal of International Affairs* (37) 1984, pp 283–93.

controlled by the widespread acceptance of the NPT was shattered when India, a non-signatory to the NPT detonated, in May 1974, what it terms a 'peaceful nuclear explosion' (PNE). As there is no way to distinguish PNE technology from bomb technology, the test clearly demonstrated that India had acquired the ability to build a bomb.¹¹

In response to this the nuclear exporting nations met to strengthen non-proliferation efforts in addition to the NPT. They met first secretly, to discuss common export policies aimed at restricting the flow of sensitive technology. In 1975, the existence of the nuclear suppliers group, also known as the London Club, became public knowledge, raising fears among consuming countries of a supplier cartel that would discriminate against the developing countries' imports of peaceful nuclear technology. The supplier nations said that the Club's purpose was merely to prevent competition for export markets from undermining the non-proliferation regime. The voluntary export guidelines developed by the 15-member Club, which were made public in 1978, emphasised that certain sensitive nuclear technology should be exported only if properly safeguarded, but did not prohibit exports.¹²

By this time, both suppliers and consumers recognised that almost any country that really wanted nuclear weapons could, given enough time and effort (including technical and financial resources), build itself a bomb, no matter what restrictions the rest of the world might impose. This was, in short, the conclusion of the International Nuclear Fuel Cycle Evaluation Conference (INFCE) which reported in 1980 having been initiated by President Carter in 1977. The technology and materials were too widespread to be absolutely controlled. This is not to say that it would be easy for developing countries to build a nuclear explosive, but merely that it could be made impossible. Attention turned to the need to keep the rate of proliferation sufficiently slow to permit the world to adjust to any spread of weapons that did occur, and to increase barriers to proliferation as much as possible.¹³

The Article IV 'carrot'

In return for giving up the nuclear weapons option, the non-nuclear weapon signatories were offered not only the promise of a move towards disarmament by the nuclear weapon parties under Article VI, but also favourable access to nuclear power under Article IV. Paragraphs 7 and 8 of the preamble to the Non-Proliferation Treaty (NPT) states:

the principle that the benefits of peaceful applications of nuclear technology . . . should be available for peaceful purposes to all parties to the Treaty.

and:

in furtherance of this principle, all Parties to the Treaty are entitled to participate in the fullest possible exchange of scientific information for, and to contribute alone or in cooperation with other states to the further development of the applications of atomic energy for peaceful purposes.

Article IV of the Treaty sets out in more detail the 'inalienable right' of all Parties to the Treaty to benefit from the peaceful uses of atomic energy and ways in which this may be fulfilled. Article III of the Treaty sets out the broad arrangements for safeguarding against diversion to military use any atomic energy projects or materials designated for peaceful uses. Article IV evolved as a result of pressure from the industrially developing states who wanted a stronger more specific commitment to share and promote peaceful nuclear technology than was to be found in the general proposal of the preamble quoted above. The background to this Third World interest in nuclear power goes back to the 1950s.

The industrialised nations in the 'North' developed their nuclear energy capacity (ie scientific and physical infrastructures) in what many observers characterise as the age of atomic optimism in the 1950s (essentially a research stage) and 1960s (when commercial implementation got underway). Three Northern nations with large installed nuclear energy capacities (the US, Soviet Union and UK with 69 GWe,* 23 GWe and 9.5 GWe commissioned capacity in mid-1985 respectively) developed their own peaceful nuclear electrical programmes out of military atomic programmes begun in the 1940s. A fourth nuclear weapon nation, France, which has the highest percentage of its electricity capacity met by nuclear generation (about 60 per cent. 29 GWe, in mid-1985) developed its nuclear weapon capability after it

* GWe = gigawatts electrical power. A gigawatt is 10^3 Megawatts or 1000 Mw(e).

had commissioned its first reactor generating nuclear electricity, although under its atomic energy agency (CEA) little distinction between military and peaceful developments was ever attempted.

In its first two decades, nuclear energy became established as politically and technologically popular for a number of reasons:

- 1) It allowed the awesome power of the split atom of fissionable nuclear material to be put to a constructive purpose (above all, electricity generation) rather than a destructive military purpose. Many scientists and engineers were attracted to work with atomic power for this reason.
- 2) It received very large capital investment for research and development (R&D) from governments ranging across the political spectrum or location around the globe. 'Liberal' capitalist economies to industrially developing states to centrally planned economies all invested substantially in atomic R&D.
- 3) The US 'Atoms for Peace' Plan announced in December 1953 by President Eisenhower. One analyst, Munir Ahmad Khan of Pakistan's Atomic Energy Commission described Atoms for Peace as unveiling a golden era of atomic cooperation and stressed:

Whatever the motives behind the plan, it was without doubt a unique and commendable gesture. The end result of the 'Atoms for Peace' Plan was a large scale and worthwhile transfer of peaceful nuclear technology. The United States trained thousands of engineers and scientists in its own laboratories and provided a large number of research reactors and other facilities to several advanced as well as developing countries. Many developing countries took a keen interest in this new technology which offered both prestige and long term potential economic benefits. The net effect of the 'Atoms for Peace' programme was decidedly positive and far-reaching as far as the less developed countries were concerned. Beside imparting know-how in nuclear research, it acted as a catalyst for initiating a quiet but meaningful scientific and technological change.¹¹

- 4) Along with the US Federal Government sponsorship of Atoms for Peace, a number of large industrial corporations that had invested in atomic energy development in the 1950s began to promote the

benefits of atomic power in a global sales drive. These corporations included Westinghouse, General Electric and Combustion Engineering. In the early 1960s, the commercial sales operations were accompanied by the ubiquitous slogan 'Atomic power: electricity too cheap to meter.'

- 5) Apart from national government campaigns similar to the US 1953 initiative, the British, French, Canadian and West German governments—along with the Soviet Union in a more restricted way—also promoted nuclear exports. In 1957 these governments were joined by the European Community's nuclear agency EURATOM and the Nuclear Energy Agency (NEA) of what is now called the Organisation for Economic Cooperation and Development (OECD), both of which had technical and information programmes to assist atomic development. But more important than either EURATOM or NEA was the International Atomic Energy Agency (IAEA) also established, by international statute, in 1957 as an autonomous organisation affiliated with the United Nations. The IAEA had major financial and political support from the United States.

The IAEA had as one of its two main functions to promote the peaceful uses of atomic energy, including technical assistance. Its other major role was to apply international safeguards, initially only when requested by sovereign states.

Safeguarding the future?

In 1970 the same year as the NPT came into force, the International Atomic Energy (IAEA) published a set of safeguards arrangements (IAEA Document INFCIRC/153) detailing how to apply the mandatory duty to prevent military diversion of civil atomic energy projects or materials set out in NPT Article III. This had been seen as the central complement to Article IV.

Prior to the 1985 NPT Review Conference, the IAEA had negotiated a safeguards agreement under the general provisions of INFCIRC/153 with 84 non-nuclear weapon states party to the NPT. Safeguards arrangements were in force with seventy-eight of these states (according to NPT Newsletter in *IAEA Bulletin* 27(2) Summer 1985). The IAEA Director-General, Dr Hans Blix, described the benefits and limitations of such nuclear safeguards in the same issue of the *IAEA Bulletin*: 'Safeguards cannot prevent a violation of obligations—the diversion of fissile material—any more than a bank or company audits can prevent a misappropriation of funds. All they can do is expose infringements or

arouse suspicions—in effect, sound the alarm.’ Despite INFCIRC/153, a series of supplementary safeguards provisions and restrictions were developed in addition to NPT related safeguards.

The nuclear technology suppliers began work together to develop a ‘trigger list’ (so called because the export of any of the items on the list would trigger the safeguards arrangements into action) of nuclear technologies that would automatically require the application of safeguards. Under the guidance of the Swiss scientist, Professor Claude Zangger, this expert committee produced its interpretation list which they communicated to the IAEA. Just months before the publication of the ‘trigger list’, India, a non-NPT nation, exploded its nuclear device in the Pokharan desert near the Pakistan border.

Objections to the NPT

Critics of the NPT tend to come from two sources: the governments of non-signatories who feel the treaty is discriminatory and those predominantly non-governmental critics, who feel that the NPT has within it an inherent and dangerous inconsistency.

As was outlined earlier, the NPT was the culmination of nearly a decade of careful diplomacy. On 31 May 1968 the American and Soviet delegates submitted the final revised draft of the Treaty to the UN General Assembly, after detailed redrafting had taken throughout the spring, following UN General Assembly resolutions adopted in the 1966 and 1967 sessions (especially 2149 (XXI) 4 November 1966, 2153 A(XXI) 17 November 1966, and 2346 A(XXII) 19 December 1967). But this *Pax ‘Russo-Americana’* was severely criticised by a number of states, above all India and the People’s Republic of China.

India and the NPT

Dr Vohra summed up India’s policy thus: ‘We will not sign the NPT; we will make no atomic weapons; we will accept no guarantees’ (see note 9). Another analyst, T T Poulouse, wrote in the *India Quarterly* (April 1978):

While India has been as much opposed to the proliferation of nuclear weapons as any of the nuclear weapons powers, the NPT in the present form is not and, will not be, acceptable to it, primarily because it is designed mainly as a political instrument of the two superpowers to divide the nations into the nuclear ‘haves’ and the nuclear ‘have-nots’. After the superpowers had acquiesced in selective proliferation before 1967—the fateful year when the NPT formalised the status of nuclear and non-nuclear weapon powers—both the civilian and military

nuclear technology became the monopoly of the five nuclear weapons powers. This is the most discriminatory character of the NPT. But apart from this basic weakness, two out of the five nuclear weapons powers still remain non-parties to the NPT. The NPT has also failed to do anything whatsoever to declare illegal vertical proliferation, the most blatant form of present nuclear proliferation. A non-proliferation agreement which ignores the present proliferation, and preoccupies itself with future proliferation, is naturally unrealistic, ineffective and therefore unacceptable to those nations, including India, which want a non-proliferation treaty to curb both the vertical and horizontal proliferation. Instead, the NPT concentrates exclusively on the dissemination and spread of nuclear weapons (see note 9).

India has steadfastly refused to accede to the NPT, despite overtures by Pakistan's General Zia, above all at the celebratory Fortieth General Assembly of the UN in October 1985, when he declared Pakistan would join the NPT if India similarly were prepared to do so. Reciprocal distrust in the sub-continent, as well as a desire not to be belittled on the world stage has reinforced India's objections to the NPT.

The People's Republic of China

In 1967-8, with the Vietnam War escalating along her southern border, the People's Republic of China held the US and USSR in about equal contempt. She had broken with the USSR in 1959, partly as a result of differences over the aid that the Soviet Union was prepared to make on nuclear technology. It was only after President Nixon's visit in 1972 that a new rapprochement began with the US. For the Chinese the 1960s was a decade of diplomatic isolation.

In an unsigned official statement on nuclear proliferation, published in English in the *Peking Review* of 18 November 1966, the Chinese expressed trenchant views on the US, USSR and the prospective NPT: The treaty on the non-proliferation of nuclear weapons jointly drawn up by the US and the Soviet Union is absolutely unjust and unfair to the other countries of the world. Whereas the US and the Soviet Union may develop nuclear weapons on a big scale and go all out for nuclear monopoly, the non-nuclear countries are not allowed to have anything whatsoever to do with nuclear weapons, not even to think of them. Nor is this all. They should sign such a document on the dotted line, pledging that they will not do so, nor think about it. Is there anything more preposterous under the sun?

The Chinese concluded that the NPT was a monstrous fraud; that the US was the world's biggest proliferator with nuclear bases spread around the world; and that the aim of the NPT was to 'hoodwink the people of the world'. Moreover, between exploding her first nuclear

test in October 1964 and her first H-bomb test on 17 June 1967, the Chinese Foreign Minister, Chen Yi, actually expressed the hope in 1965 that Afro-Asian nations would be able to make nuclear weapons themselves and that 'it would be better for a greater number of countries to come into the possession of atom bombs.'

By late 1985 the People's Republic of China had considerably tempered this trenchant view. This change of perspective on nuclear proliferation was underlined by Ambassador Qian Jiadon's confirmation to the UN in early November 1985 that an earlier speech by Deputy Premier Li Peng, on 18 January 1984, to the effect that his country 'had no intention at present or in future of helping non-nuclear countries to develop nuclear weapons', was the official Chinese view. The statement by Ambassador Qian was provoked by US Congressional concern that the Chinese had an irresponsible attitude to non-proliferation—a concern that had held up an enabling accord between Washington and Beijing on nuclear technology transfer, originally agreed in May 1984 and approved by President Reagan in July 1985. Moreover, immediately subsequent to the 1985 NPT Review Conference, the Chinese Deputy Nuclear Minister, Zhao Ping, told the annual meeting of the IAEA—a body the Chinese had joined only twenty months earlier—that the People's Republic of China were prepared to allow nuclear safeguards inspection 'at some of its civilian nuclear installations', under an arrangement to be settled with the IAEA 'at an appropriate time.'¹⁵

The French objection

The French objections to the NPT in some ways parallels Indian and Chinese concerns that the Treaty is discriminatory. The perspective taken by successive French administrations on the NPT has been explained by Bertrand Goldschmidt, French representative to the IAEA, 1958–80, in the 1985 (a) SIPRI study (see note 9).

Tyler, 'Panel back nuclear pact with China, but link US sales to non-proliferation' *International Herald Tribune*, 15 November 1985.

Nuclear commerce outside the NPT

- a) France has refused to become a party to the NPT, but declared in 1968 that it would behave 'as though it were a party'. This assurance, however, must be set against its nuclear activities in practice. In 1976, for instance, the French government endorsed the sale of the Koeberg nuclear plant to South Africa—a non-party—winning the order against stiff competition from vendors from the US, the Federal Republic of Germany and the Netherlands. France also supplied a reprocessing plant, capable of producing weapons grade plutonium, to Pakistan—another NPT non-party—breaking off deliveries of hardware only when the plant, at Chashma, was nearing completion.
- b) In 1980 a consortium of companies from the Federal Republic of Germany and Switzerland won an order from Argentina to supply not only the Atucha-2 nuclear station but also a heavy-water plant. Reports indicated that the German-Swiss bid was substantially higher than that from a Canadian consortium but Canada was insisting that Argentina accept full-scope safeguards as a condition of sale, whereas the German-Swiss bid did not make this condition. Argentina was at the time completing a reprocessing plant at Ezeiza, that was under no safeguards whatever. Indeed, the IAEA claimed to have no knowledge of the plant when its existence was revealed. However, the nuclear situation in Argentina appears to have improved since the country's return to democratic government; for instance President Alfonsín has issued strong statements in favour of a halt to nuclear testing arising from his involvement in the Five Continents Peace Initiative with five other heads of state—the most recent collective communiqué being released at the end of October 1985. Additionally, in March 1985, Argentina and Brazil began negotiations for reciprocal nuclear inspections of each other's nuclear facilities details of which will be sorted out in a joint committee in early 1986 according to *Nucleonics Week* (5 December 1985). But the improvement owes nothing whatever to the behaviour of NPT parties in the interim, some of whom were seemingly prepared to deal with the Argentine military government with impunity.
- c) From the late 1970s onward, the US, UK and France battled to win contracts to sell nuclear technology to the People's Republic of China which was not only a non-party to the NPT, it was a nuclear

weapon state and the only country still exploding nuclear weapons in the atmosphere; moreover, it refused to have anything to do with international safeguards until September 1985, although a hint had been given by the Chinese a year earlier at the 1984 IAEA annual meeting. It was also reported to have aided several other states, in particular Pakistan, to develop nuclear weapons.

Criticism from non-governmental organisations

Non-governmental critics point out that one of the carrots offered by the NPT to halt the spread of the bomb, is the very technology that can lead to its production, i.e. nuclear power. Environmentalists point out the drawbacks of this technology compared with the so-called 'soft energy path'; developmentalists point out that nuclear power is totally unsuited to supply the energy needs of developing countries and the peace movement is concerned that parties can withdraw from it at short notice (under Article X), taking with them the 'civil' nuclear benefits already conferred and perhaps using these in a less than peaceful manner. All are united in their condemnation of the US, USSR and UK in their failure to live up to what might be termed their vague commitment to pursue negotiations in good faith. (At the 1985 NPT Review Conference there were forty-six non-governmental organisations (NGOs) present, each for part of the month-long conference at least. Every continent bar Africa was represented amongst the ninety or so NGO delegates present).

Most critics, however, whether national governments or non-governmental organisations recognise that flawed as it is, if the NPT were to collapse nothing would replace it: the Third Review Conference was therefore awaited with considerable concern in certain quarters. In the lead-up to the September Geneva meeting, substantial efforts were made by the nuclear weapons signatories—the depository states—to endeavour to make things go smoothly. The US encouraged new members into the Treaty; the USSR opened some of its nuclear installations to IAEA inspectors for the first time¹⁶ and the UK has called upon its nuclear industry to make greater efforts to meet the needs of non-nuclear weapons countries.¹⁷ The superpowers also held

¹⁷ 'British launch campaign saluting NPT benefits as review approaches', *Nucleonics Week* 25(37) 13 September 1984.

bilateral planning meetings in 1984 and 1985 to attempt to ensure that the debate at the Review Conference would not jeopardise the extended existence of the NPT.

The 1975 and 1980 NPT Review Conference—two worsening precedents¹⁸

1975 Review Conference

The first Review Conference of the Non-Proliferation Treaty was held in Geneva between 5–30 May 1975 to fulfil Article VIII of the NPT: 'with a view to assuring that the purpose of the preamble and provisions of the treaty are being realised'. Despite the fact that it prompted some twenty additional countries to sign and ratify the NPT, it was not a resounding success and revealed continuing deep divisions between the nuclear 'haves' and 'have-nots' over the purpose of the treaty.

Third World participants called for specific undertakings from the nuclear weapons states, including a comprehensive ban on all nuclear tests, above and below ground; a genuine reduction in the nuclear arsenals—a guarantee that nuclear weapons would not be used against any non-nuclear weapons state party to the treaty; equitable arrangements for safeguards; applicable to weapons states as well as non-weapon states and preferential treatment for treaty parties; especially Third World countries in international nuclear commerce. These demands were refused by the US, USSR and UK. In 1975 there were about 190 nuclear reactors in operation world-wide and the Stockholm International Peace Research Institute (SIPRI) calculated that about 85 tonnes of plutonium existed in stocks globally.¹⁹

The NWSs were preoccupied with devising more restrictive technical requirements for safeguards and efforts to reach agreement on a draft for a Final Declaration nearly failed as the NNWSs, led by Yugoslavia, berated the weapons states for failing to live up to both the Article IV and Article VI obligations. It was only the personal standing of the Swedish President of the Conference, Inga Thorsson, that enabled a last minute compromise to be reached, but even then the NWSs felt it was

¹⁸ Excellent reviews of both conferences are found, *inter alia*, in, W Epstein, 'Failure at the NPT Review Conference', *Bulletin of the Atomic Scientists*, September 1975, pp 46–8; 'The Second NPT Review Conference', Chapter 10 in *SIPRI Yearbook 1981*, pp 297–371; A Corradini, 'The Second Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons', *Disarmament* 3(3) 1980.

¹⁹ *Preventing Nuclear Weapon Proliferation: An Approach to the Non-Proliferation Treaty Review Conference*, Stockholm: SIPRI, 1975

too strongly worded and the NNWSs felt it was not nearly strong enough.²⁰ Although it papered over such fundamental differences, the Final Declaration did at least strongly reaffirm the participants' strong common interest in averting the further proliferation of nuclear weapons . . . their strong support for the Treaty, their continued dedication to its principles and objectives, and their commitment to implement fully and more effectively its provisions.

1980 Review Conference

The second NPT Review Conference took place in Geneva from 11 August–7 September 1980. The two major focuses were the superpower arms race and the development and promotion of nuclear energy. The Third World countries (all NNWSs) insisted that any final declaration include reference to the failure of NWSs to live up to their Article VI commitment 'to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament. The US, USSR and UK responded lamely that they had despite the fact that arms control negotiations had broken down, giving way to a further build up of new and yet more dangerous weapons systems. Any hope for a Comprehensive Test Ban Treaty (CTBT) or for ratification of the second strategic arms limitations agreement seemed remote, the Review Conference taking place just after the disrupted Moscow Olympics, itself following the Soviet intervention in Afghanistan in December 1979.

On Article IV questions of nuclear power technology conflict arose amongst the nuclear supplier countries. One group, including the US, wanted the Conference to recommend that all nuclear exports be made conditional on acceptance of full-scope safeguards. This was already required for US exports by the Nuclear Non-Proliferation Act of 1978 (USNNPA) and under Canadian and Australian law. Another group of suppliers, including the UK, West Germany, Italy and Japan, endorsed the concept of full-scope safeguards but was reluctant to have the conference recommend that such safeguards be a required condition of export.²¹

²⁰ D S Kramer, 'The nuclear non-proliferation treaty review conference', *CRS Report* 80-65, Washington DC, March 1980.

²¹ For a comprehensive review of the non-proliferation and nuclear technology transfer issues prevailing in the period prior to the 1980 NPT Review Conference see A Kapur, 'The nuclear spread: a Third World view', *Third World Quarterly* 2(1) January 1980

Against a background of the fact that in 1980, not one of the world's 244 nuclear power reactors was in an industrially developing nation party to the NPT, the Third World participants had little interest in the issue of full-scope safeguards for non-parties. They demanded preferential access to nuclear exports over non-NPT parties, since the opposite had in fact been the case in many instances. The atmosphere of the entire meeting was very acrimonious and despite being carried over for two extra days the countries that attended were unable to agree on a substantive Final Declaration.

The 1985 Review Conference

With the experience of the 1980 failure uppermost in many people's minds, there were understandable fears that the 1985 Review Conference could result in the collapse of the NPT. Increased superpower tension and the fact that since the NPT was signed in 1970 the total number of strategic nuclear weapons belonging to the nuclear weapons states had risen from 6,000 to 20,000 (to 50,000 warheads in total when all nuclear weapon systems were counted) meant that Article VI was bound to be a central sticking point at the conference.

The Third Review Conference took place from 27 August–20 September and opened with the statements of fifty-eight of the eighty-six parties and two signatories in attendance. As was expected, questions of compliance with Article VI, and the increased threat posed by the arms race, dominated the substance of the statements.

Article VI Compliance

Virtually all the delegates expressed the view that the weapons states were not adhering to the letter and spirit of Article VI. 'There certainly is broad agreement', said Ambassador Sularto Sutowardoyo of Indonesia, '... that the situation has considerably worsened, especially as regards the implementation, or non-implementation, to be more exact, of the Provisions of Article VI.'²² Ambassador Enrique Ter Horst of Venezuela agreed, 'We know that neither the Soviet Union, nor the United States, has complied with this (Article VI) obligation.'

Not surprisingly there appeared marked differences between nuclear weapons states and non-nuclear weapons states over the definition of adequate compliance with Article VI. 'We have met, and will continue to meet, our obligations under Article VI', declared the United States

²² All quotations taken directly from texts submitted to the Review Conference

Arms Control and Disarmament Agency Director, Kenneth Adelman. 'The Soviet Union', said Ambassador A M Petrosyants, head of the delegation of the USSR, 'is striving for a strict implementation by all states party to the treaty of the obligations they assumed under it.' Two months later both President Reagan and CPSU General Secretary Gorbachov reiterated the importance of the NPT to both states in their 19-21 November Summit communiqué. It was one of the few things they agreed upon, i.e. keeping the nuclear club exclusive.

Yet this view was not endorsed by other non-nuclear Western states; Sweden's Minister of Foreign Affairs, Lennart Bodstrom, stated: 'The implementation of the undertakings (under the NPT) by the non-nuclear weapons states has been adequate and satisfactory. Unfortunately, the same cannot be said of the Treaty commitments of nuclear weapons states.' In support of the US position, Mr Adelman cited the resumption of bilateral negotiations with the Soviet Union and the removal, in conjunction with other NATO nations, of 2,400 nuclear weapons from Europe since the last Review Conference. (It should be noted that the US delegate failed to point out that the withdrawn nuclear weapons, mostly Atomic Demolition Munitions (ADMs), were obsolete in any case, and that they were programmed to be replaced by an array of modern systems including nuclear-capable weapons.)

By contrast, a vast majority of the delegations considered these measures inadequate. 'While nuclear arsenals may not have been increased at the same rate quantitatively', declared Ambassador Jayantha Dhanapala of Sri Lanka, 'there has been a significant trend towards the qualitative improvements in nuclear arms, in no way contributing towards the cessation of the nuclear arms race as required by Article VI.'

A practical first step to nuclear disarmament was widely recognised to be the completion of a Comprehensive Test Ban Treaty (CTBT). Achievement of a CTBT has been a constant demand of non-nuclear countries at the United Nations disarmament forums and in the two previous NPT Review Conferences. Indeed, the UN has regularly passed resolutions since 1954 supporting the cessation of all nuclear warhead testing.²³ A CTBT would be a vital and technically achievable first step²⁴ to a global nuclear 'freeze' because it would constrain the

superpower arms race—vertical proliferation—by restricting qualitative advancements in the nuclear arsenals of the nuclear weapons states. The nuclear weapons states use explosive testing as a fundamental stage in the development of new nuclear weapons designs. It would for example, hinder a key element, the 'Star Wars' Strategic Defense Initiative, since nuclear testing is required for its X-ray lasers and electromagnetic pulses.²⁵ A CTBT would be a very effective measure for controlling the spread of nuclear weapons to more countries. No state can rely, with any confidence, on its nuclear weapons capability until its nuclear explosive 'device' or warhead has been proved workable.

A CTBT, and particularly a moratorium on nuclear warhead testing could be concluded in a relatively short period of time if the political will existed. Negotiations for a CTBT were about 90 per cent complete when they were broken off in 1980, according to former British Foreign Secretary Dr David Owen, who was involved directly in the 1977–8 tripartite CTBT talks with the US and Soviet delegations. Perhaps more importantly there is an historical cause for optimism about the possibility of success for such an attempt to halt nuclear tests. In 1961 President Kennedy declared a unilateral ban on atmospheric testing and challenged the Soviet Union to follow suit. They did, and a few months later the Partial Test Ban Treaty was signed.

The case for a CTBT was put strongly in the opening session of the Third Review Conference: 'There exists a virtual consensus', said E Ahmed Esmet Abdel-Maguid of Egypt, 'that a total ban on nuclear weapons tests represents the first serious and tangible step towards ending the arms race.' This sentiment was repeated in the vast majority of the opening statements, as was an appeal that negotiations be resumed. 'Multilateral negotiations on a CTBT must start immediately without further delay', declared the Swedish Minister of Foreign Affairs, Lennart Bodström.

Most delegations expressed the view that a CTBT is required under the NPT, and is vital to a successful non-proliferation regime. 'The NPT

spells out clearly that a CTBT has to be sought', said Ambassador F J A Terwisscha Van Scheltinga of the Netherlands. A comprehensive test ban is 'an essential contribution to the reinforcement of the NPT', agreed Belgian Ambassador Jacques Raeymaechers. Several delegates declared their intention to seek concrete commitments from the nuclear weapons states on Article VI obligations. 'The purpose of this meeting is not to devise acceptable language to clothe our different perceptions until we reassemble five years hence', said Ambassador Jayantha Dhanapala of Sri Lanka. 'If this Review Conference is to be successful', agreed Lennart Bodstrom, 'the nuclear weapons states must give concrete evidence that they take seriously their obligations under Article VI.'

Ambassador Alfonso Garcia Robles of Mexico suggested that, if consensus on a final statement proved impossible to reach the states party could adopt one of several resolutions 'in conformity with the provisions of Rule 28 (of the Rules of Procedure)'. This meant calling for a vote, a precedent the nuclear states were not keen to see. In addition to this, prior to and during the NPT a number of events occurred to strengthen the demands for a CTBT.

The Soviet Union has frequently reaffirmed its support for the CTBT and had announced in July 1985 its readiness to agree to a moratorium on the testing of nuclear weapons effective from 6 August, to coincide with the fortieth anniversary of the dropping of the Atom Bomb on Hiroshima. Initially the moratorium was to last until the end of the year, but the Soviet Union proposed an indefinite extension were the US to join them in halting nuclear tests.

In the summer of 1984 a major breakthrough occurred when the US Senate voted 77 to 22 for Senators Kennedy and Matthias' resolution calling on President Reagan to resume negotiations for a CTBT. This was followed up by Senator Edward Kennedy and others in Congress in the putting forward of an amendment to the Defense Bill aimed at cutting off funding explosive nuclear testing, subject to a reciprocal halt by the Soviet Union. This would result in a *de facto* moratorium on testing.

During the NPT Review Conference the former UK Foreign Minister, Dr David Owen, now leader of the Social Democratic Party, attacked the excuse proffered by the governments of the US and UK that verification difficulties were the reason for not immediately resuming negotiations for a CTBT. Citing significant advances made in verification technology since the United States abandoned negotiations

on a CTBT, Dr Owen said, 'I have no doubt whatever of our capacity to verify almost all explosions.' The reason put forward by the nuclear weapons states on the inadvisability of a CTBT are a 'combination of misinformation and obfuscation'.

The European Parliament also passed a strongly worded resolution during the Conference calling for the US, UK and USSR to resume negotiations for a CTBT, as did a letter from Senator Kennedy and seventeen other US Senators. A vote was in the end not called for, but the final declaration was a stronger one than would have occurred had not a vote been threatened. The addition that resulted in the form of an amendment to the final document stated:

The Conference reiterated its conviction that the objectives of Article V remained unfulfilled and concluded that the nuclear weapon states should make greater efforts to ensure effective measures for the cessation of the nuclear arms race at an early date and expressed the hope for rapid progress in the US-USSR bilateral negotiations.

The Conference, except for certain states whose views are reflected in the following sub-paragraph, deeply regretted that a comprehensive multilateral Nuclear Test Ban Treaty banning all nuclear tests concluded so far and therefore, called on the nuclear weapon states party to the Treaty to resume trilateral negotiations in 1985 and called on all the nuclear weapon states to participate in the urgent negotiations and conclusion of such a Treaty as a matter of the highest priority in the Conference on Disarmament.

At the same time, the Conference noted that certain states party to the Treaty, while committed to the goal of an effectively verifiable comprehensive nuclear test ban treaty, considered deep and verifiable reductions in existing arsenals of nuclear weapons as the highest priority in the process of pursuing the objectives of Article VI.

'Certain states party' referred solely to the US and UK since the USSR had expressed its willingness to resume CTBT negotiations. (The US administration has since hinted that Turkey also expressed their reservations about the call for a CTBT, at least in the form the final document mandated.)

Although demands for a CTBT had been a constant feature of the previous two NPT Review Conferences, the Third Review Conference differed from its predecessors in that the demands of industrial developing countries for improved access to nuclear technology moved from the centre of discussions as had previously been the case, to the periphery. This almost certainly reflects the declining importance put upon nuclear power as an energy source by the vast majority of these

countries.²⁷ Apart from the ritual support for exchange of nuclear technology in the conference documentation it was only Egypt with its call for a 'financial assistance fund' which tried to breath life into this otherwise moribund issue. Even that modest effort, it must be said, sank without trace.

Such a reaction is, on reflection, hardly surprising. Firstly, the vast majority of the Third World signatories will never have any significant use for nuclear power because the population distribution and density of the industrial infrastructure would never demand the capital investment in complex electrical grid systems and the high power load associated with such a system. Secondly, and most importantly, nuclear power has failed to live up to its much trumpeted technological and economic promise, due to a number of factors ranging from over-optimism regarding the solution of operational problems to the failure to convince the public world-wide that nuclear waste can be safely managed or disposed of without environmental damage.

As the electricity industry magazine *Electrical Review International* put it in September 1984, with regard to the decision over whether states should decide to develop or import nuclear technology:

Experience has shown that if the only reason for obtaining nuclear technology is to generate power then the answer is no. Unless a country gets to grips with the nuclear fuel cycle (which the suppliers have tried so hard to prevent) then a nuclear programme is a liability which leads to dependence on the suppliers. But getting to grips with the fuel cycle is an enormously expensive undertaking. Only nations with a good industrial technological and economic base stand any chance of success.

In 1974, for example, the International Atomic Energy Agency (IAEA) projected that by the year 2000 installed nuclear capacity would reach 5,000 gigawatts. Yet in September 1985 the IAEA put on record at the NPT Review Conference that it is now expected that the figure will be only 500 gigawatts, one-tenth of their 1974 prediction. Furthermore, although the IAEA expects that 20 per cent of the world's electricity will come from nuclear power stations by 1990, most of the increase will be in the industrially developed countries. In 1984 only two new units totalling 800 megawatts were connected in developing countries compared with thirty-two in industrialised countries.

²⁷ Despite its role as a global promotional agency for the use of nuclear energy, even the International Atomic Energy Agency (IAEA) did not really present a convincing argument for expanding nuclear energy, except in a small number of countries. See 'Background paper on the activities of the IAEA relevant to Article IV of the NPT', NPT/CONF III/10, June 1985.

Small wonder that the IAEA in a transparent understatement expressed the view at the conference that 'The nuclear power trends in developing countries remained very uncertain.' These uncertainties will be discussed at the Peaceful Uses of Nuclear Energy (PUNE) conference sponsored by the UN and planned for early 1987. The same is true in Eastern Europe where the COMECON bloc's Department of Nuclear Energy has acknowledged that the ambitious nuclear energy programme of the Soviet Union and its East European partners has had to be scaled down because of 'technical difficulties'.²⁸ These more realistic and substantially reduced expectations of the more likely *future* role of nuclear power did not mean however that there was a lack of interesting statements and debates at the Conference about the *present* use of nuclear power. These suggestions centred on ways in which the world could improve the potential for preventing both its clandestine use in the production of nuclear weapons and how changes in the present nuclear fuel cycle could play a central role in achieving disarmament.

The Nordic nations of Denmark, Finland, Iceland, Norway and Sweden took the lead in efforts to halt the spread of the bomb to new countries by demanding, *inter alia*, that: the full-scope IAEA safeguards be applied by NPT signatory states to all their present and future nuclear activities and should be extended to non-signatories of the Treaty; that this be reinforced by insistence on full scope safeguards by all supplier states as a minimum condition for exports of relevant nuclear material, equipment and technology. More contentiously and of more fundamental importance to halting the most dangerous form of proliferation ie the nuclear arms build-up of the present nuclear nations, the five Nordic nations called for 'Steps towards separation of civil and military nuclear sectors in the nuclear weapon states parties to the Treaty, with application of IAEA safeguards in the civilian nuclear sector in the countries', and 'cessation of the production of fissionable material for weapon purposes.' The first three of these demands were also supported by written submissions from Australia, Canada, Ireland, the Netherlands and New Zealand and ended up in the final consensus statement of the NPT.

The most radical of the demands emerging from the NPT was the halt to the production of fissionable material for weapons purposes—the so called 'fissile material cut-off'. This initiative was supported by a wide

²⁸ *Financial Times* (London) 6 September 1985.

range of non-governmental organisations present at the Review Conference—most especially by the Federation of American Scientists.²⁹ This idea will inevitably gain credence between now and the next Review Conference in 1990. This will be particularly true in Europe where concern is growing about the possible emergence of a European nuclear force. It is thought that this could use plutonium extracted from re-processed fast reactor fuel or the so-called 'blanket' surrounding the core fuel, perhaps from the proposed Dounreay plant in Scotland. What makes this likely is the development of a pan-European fast breeder reactor programme. The French opened their 1,200 Mw Super-Phoenix fast breeder plant in September, in the middle of the Review Conference, and a number of senior French officials have publicly stated that it will have a military role.

The final result of the Third Review Conference was far more constructive than many had expected and much less acrimonious than its predecessor in 1980. A breakdown was averted despite disputes over attempted embargoes on Israel and South Africa; a quarrel between Iraq and Iran over the former's purported bombing of the latter's nuclear construction site at Bushehr; and the long-standing issue of implementation of a CTBT.³⁰

Nevertheless, concern still remains about the future of the NPT. Even if questions about access to nuclear power have become less prominent the signatories will still be looking for improvements under Article VI before the NPT comes up for renegotiation in 1995.³¹ Such longer term concerns were voiced at the Third Review Conference when several states expressed fears in light of the difficulties in implementing Article VI, over the future viability of the Treaty regime. 'We need to have a successful Third and Fourth Review Conference to ensure the right decision in 1995', said Ambassador Jayantha Dhanapala of Sri Lanka, 'If we fail, the prospects for 1995 will be bleak. The time for constructive decisions is now.'

'The survival of the NPT itself', agreed Ambassador Nissai Vejajiva of Thailand, 'and perhaps the entire non-proliferation regime may

³¹ Many of these concerns were foreshadowed at a conference in June 1985, sponsored by Sadruddin Aga Khan's Groupe de Bellerive, based in Geneva. The papers are collected in *Nuclear War, Nuclear Proliferation and the Consequences*, Oxford: Clarendon Press, 1985.

depend on the ability of the nuclear weapons states to thoroughly convince the remaining signatories of the Treaty that they will adopt concrete and significant measures to end the arms race and commence nuclear disarmament.'

Women: a decade is time enough

'The United Nations Decade for Women: Equality, Development and Peace', has run its official course. Its three milestones have been the Conference of International Women's Year in Mexico City in 1975, which inaugurated the Decade, the mid-Decade Review Conference in Copenhagen in 1980, and the World Conference in Nairobi in 1985 to appraise the Decade's achievements.

Some eighteen thousand women, coming from every region of the world, speaking for their governments, their organisations, themselves, assembled in Kenya last summer for that closing event: they were nearly three times the number that had started it all off in Mexico. A microcosm of womankind, they embody the degree to which those past ten years, viewed in retrospect, have made a difference to the global landscape.

All that happened on the way from Mexico City to Nairobi has been instructive, much of it unpredictable. It was, for instance, no part of any preconceived design that a particular goal of the Decade should determine the thrust of each of the three conferences. And yet this is how it turned out. The core issue of Mexico City was Equality; of Copenhagen, Development; of Nairobi, Peace. This is not surprising: for the Decade, the formal framework of the contemporary feminist revolution, existed, not in Wonderland, but in the very real world. It was inevitably conditioned by the climate of that world.

The mood and temper of the early 1970s showed confidence in the capacity of multilateral processes to direct change and to advance the human condition. The political will which created a Decade for Women with the United Nations as its cornerstone was a measure of that confidence. The Charter of the UN had defined its role as custodian and arbiter of international morality, pledged to uphold '... faith in the equal rights of men and women and of nations large and small'. It had a splendid thirty-year history of activism in the transition of colonial nations and peoples to sovereign independence and self-determination. The decolonisation of the subordinate sex was a natural corollary of its mandate and its track record.

The conference in Mexico City built on the accomplishments of

various bodies of the UN, particularly of the Commission on the Status of Women which had been the catalyst for the adoption in 1967 by the UN General Assembly of a Declaration on the Elimination of all Forms of Discrimination against Women. Affirming that '... discrimination against women is incompatible with human dignity, ...' the Declaration laid down the philosophical criteria by which nations could move from their prevailing stage of systemic sexual discrimination to one of sexual egalitarianism.

Equality as a moral imperative was a dominant theme in the plenary and the private, the debating and the drafting sessions of the Mexico intergovernmental meeting and its parallel non-governmental Tribune. It found expression in the Declaration of Mexico on the Equality of Women and their Contribution to Development and Peace, the product of the developing countries mobilised through the Group of 77. The Declaration's paragraphs on 'equality' received near universal consent, in contrast to those on 'development and peace' which proved too contentious to evoke full and enthusiastic endorsement. It was less difficult to rally North and South, East and West around the proposition, as stated in the Declaration, that '... women of the entire world ... share the painful experience of receiving or having received unequal treatment ...' If there was an unmistakable air of exhilaration in Mexico City in 1975, it emanated from the fact that for the first time, a global assembly of governments and peoples, coming together for that prime purpose, placed their stamp of approval on women's entitlement to equality with men, and committed themselves to honour that entitlement.

The next four years saw member-states of the UN engaged in the daunting exercise of reconciling diverse constitutions, statutory, customary and religious laws, finally agreeing in 1979 on a Convention on the Elimination of All Forms of Discrimination against Women. The Convention refuted the ideology of biologically determined spheres of activity which assumed a superior public domain that was male, and an inferior domestic domain that was female. Its provisions spelt out the comprehensive range of women's political, economic, legal and social rights: it aimed to redress by force of law the discriminatory practices of the past, and actively to promote equality for the future.

Copenhagen in 1980 provided the occasion for the ceremonial acknowledgment of this landmark instrument in international standard-setting and lawmaking. By 1985 the Convention had received the

accessions or ratifications of eighty countries now legally bound by treaty to give substance to the Decade's first objective.

This is an irreversible victory of the Decade, a cause for celebration. But it must be sober celebration: for few illusions anywhere exist about the ability of constitutional amendments and legal reforms to alter attitudes or transform power structures: or, conversely, about the ability of liberal rhetoric to obscure illiberal reality.

Although the vocabulary of sexism was markedly more muted in 1985 than it had been in earlier years, sexism itself was in fact alive and well, merely sidestepping, if not backtracking, to more elusive ground; but women, after ten years of meeting and comparing notes were that much more savvy.

Thus, for example, they were less disposed to take at face value the evidence of governments' serious intent to equalise women's status by establishing Ministries, Commissions, Councils, Bureaus, etc. Surveys of those mechanisms have revealed a recurring pattern of limited charters and even more limited budgetary resources. A telling feature is location: too often in both developed and developing countries such machinery has been found as far removed as it could possibly be from the centre of real authority in the public apparatus.

Women, understandably, question whether the phenomenon they observe is not one of institutionalised tokenism, an offshoot of obstinate gender biases. The workplace gives even gloomier indications of such biases. Despite the professions of just about every government on the issue of equal economic and employment opportunities for the sexes, facts speak otherwise.

The massive influx of women into paid labour during the past twenty years carries fundamental structural, social, and economic implications. It also highlights the persistence of sex disparities, for this considerable female labour force, now 30 per cent of the world's total is characterised by the highest rates of unemployment, underemployment, and occupational segregation in the least skilled, least responsible, lowest paid categories of industry, agriculture and the service sector. The widespread, in some cases growing use of temporary, seasonal and home labour of women further underlines their vulnerability and disadvantaged situation.

The mid-1980s also register with alarm moves to dismantle affirmative policies which had in some countries been applied effectively to redress historic sexual inequalities in employment. The

Decade received a particularly unkind cut from the United Nations itself, which in 1985—also the year of the fortieth anniversary of its founding—documented the shape of its staff establishment as one distinguished by a largely female low status base and an apex exclusively composed of men. The ideology of female domesticity has been so well manipulated by a tightly bonded male bureaucracy as to make the United Nations its Decade's most visible monument to patriarchy at work.

In fact, the past ten years have made only slight difference to that stereotypical regard of women as persons whose productive roles are destined to be forever circumscribed by their reproductive roles. Hence the resurgence in the mid-1980s of anti-abortion policies aggressively pushed by a pro-natalist Right which in some instances receives the blessing, and more, of Church and State. Its message comes clothed in various doctrinal sophistries, but is quite clear, that is, to concede to women the free exercise of their rights over their bodies would be to relinquish the most strategic fortress of male superiority, therefore it is inconceivable.

Women at Nairobi took careful note of continuing evasions of the equity ethic, and devious manoeuvres to deny them personal autonomy, but they spent relatively little time there confronting them. They invested a great deal more of their resources seeking a redefinition of their goals, one which draws more logic and force from the meaning of 'development' and the meaning of 'peace'. By 1985, for millions of women, these had become the other words for 'equality'.

Early in the Decade the equity principle had been made even more persuasive by its linkage with the utility principle. Women had been a missing link in development, now they were being found: they could actually be a valuable resource, indeed were half, or more, of a nation's human resources, no longer to be wasted. This perception of women as a potential asset was of special interest to developing nations. They ensured that it was emphasised in the deliberations and conclusions of the Mexico Conference. The text of the Declaration stated it in these terms: 'The issue of inequality as it affects the vast majority of the women of the world is closely linked with the problem of underdevelopment, which exists as a result not only of unsuitable internal structures, but also of a profoundly unjust world economic system . . .'. The Declaration continued, 'The full and complete development of any country requires the maximum participation of women as well as of men in all fields: the underutilisation of the

potential of approximately half of the world's population is a serious obstacle to social and economic development.'

North and South differed on the causes of underdevelopment, but not on the subject of women in that phenomenon. So planners and managers from international, regional and national agencies set about initiating processes, and devising projects—with a frequent focus on 'income generation'—directed toward women's integration into socio-economic development. The prospect of steering women from the margin to the mainstream was as exciting to some would-be developers as to female recipients of such policies and programmes. 'Women in Development' became the Decade's overnight catchphrase, a seductive one, which for a time, at least, could evade the question of what kind of development women were to be drawn into.

Development theory and practice in the early 1970s were undergoing searching analysis by experts, predominantly male, who were dismayed at the failure of current strategies to achieve and sustain in the Third World the socio-economic advances so confidently projected in the 1960s. In 1970 the Danish economist, Esther Boserup, injected into that discussion a cautionary feminist critique which concluded that the growth models being applied to countries of the South were, perversely, resulting in the relative disadvantage of women. The Decade became a central agent for probing and expanding that thesis.

Western command of research and communication in Mexico City had been conspicuous, was often distorting, and was openly resented. The element which was missing at that encounter was the experience of Third World women documented and presented with the scope and authenticity appropriate for the majority of the world's female population.

The United Nations contributed significantly towards adjusting that imbalance. Mandates by the UN General Assembly and its Economic and Social Council to the Mid-Decade secretariat, its regional commissions and agencies, required precise and comprehensive information about women primarily in the areas of employment, education and health. Between 1979 and 1980, preparatory to the Copenhagen Conference, regional conferences in France, Venezuela, Syria, Zambia, New Delhi, in addition to a meeting of non-aligned countries in Iraq, triggered off unprecedented data collection and microstudies by governmental, intergovernmental and independent researchers. How Third World women spent their working lives became the focus of deeper inquiry and fuller understanding by those who, in

increasing numbers, were themselves female, and Third World. Their findings flowed into a swelling stream of feminist scholarship: they entered as well into the global developmental debate, which, at the mid-Decade, approached tension point.

Nineteen eighty was the year of the United Nations Special Conference on Development: it was also the beginning of the Third UN Development Decade. Both related to a responsibility of highest priority on the agenda of the international community, which was required for the third time to construct a paradigm of development which could lift the world's masses from a condition of bare survival to a decent level of existence by the end of the century.

But the political environment in which this was proceeding could scarcely have been worse. An effective development strategy for the 1980s and beyond had been premised on the expectation—strongly held by developing countries in 1974–5—that North and South could negotiate a New International Order. What was sought in essence was an adjustment in global economic power-relationships that could assure adequate resources for the development needs of the South. But the prospect of such an agreement steadily receded in the wake of an energy crisis, a global recession and mounting Third World indebtedness. There was visible wavering of the will to apply multilateral approaches to global problems: mistrust and pessimism characterised the North–South dialogue, soured as well by a failed UNCTAD V of 1979, when the United Nations Conference on Trade and Development had tried, without result, to rationalise crucial global trade and economic imbalances.

Women carried their vital concerns to that complex discourse: unlike the circumstances of previous development decades, when they had barely made it into the footnotes, this time round they would insist on being *bona fide* partners in development, acknowledged and participating in policymaking and programming: moreover such developmental policies as were prescribed should make sense in their daily lives. It also went almost without saying that the resources necessary for achieving developmental objectives should be attained.

These concerns had already been articulated in a number of ways in Mexico City; but by the mid-Decade they had acquired new urgency and new dimensions, as a consequence of the worsening economic crisis, the erosion of multilateral goodwill, and women's enhanced knowledge of their productive functions.

For example, in agriculture, the accumulating body of microstudies

with relevant sex-specific data which was coming out of Asia, Africa and Latin America confirmed the increasing marginalisation of the female subsistence farmer, a pivotal person in nearly all rural economies, the main food producer in many, most notably Africa. In response to the imperatives of international capitalist enterprise, export-oriented cash crops assumed pre-eminence over production for domestic consumption, to the detriment of women. Excluded from the resources of land, capital and technology, their status declined to previously unknown levels of sex-differentiation, deprivation and lowered productivity.

By the mid-Decade, African women analysts were sounding a most timely alarm: they pointed out with compelling data that rural underdevelopment most sharply manifested in the deteriorating condition of the female farmer could have grave consequences for national food security.

In the industrial sector, women's research on Asia, Latin America and the Caribbean was illuminating. They documented the structural transformation of the international workforce, as transnational corporations relocated their manufacturing plants to regions where labour was abundant, cheap and overwhelmingly female, comprising some 80 per cent of the international proletariat: it was unorganised labour, and uniquely vulnerable to health hazards, low skills, low wage-levels, job insecurity and sexual harassment. Such patterns of female labour use, or misuse, within national and international systems stem from entrenched perceptions of women as marginal workers: the micro mirrors the macro, and *vice versa*: hence, a comparable sexual division of labour within the household, a root factor in women's inability to participate equally in all societal processes.

What had largely been assumptions in Mexico City about development, intuitively advanced, was by the mid-Decade substance built on solid data, which women used with assurance at the Copenhagen Conference to demand and to receive support for enlarged public roles. Participating governments adopted Resolutions on Women in Agriculture and Rural Areas, Women and the New International Order, and the New International Development Strategy. These provided leverage for representation to be made to the special UN session on Development which was held a month after Copenhagen, and there women achieved, for the first time, international endorsement of their explicit and integral incorporation into all sectors of future developmental strategies.

Like the Convention on Equality this was an irreversible ideological and political gain, not to be belittled, but by no means the end of the matter. The next relevant question was, what kind of development?

The mid-Decade helped to prepare women to find an answer. In Copenhagen developmental practitioners and theoreticians had seized the opportunity to get together in the non-governmental Forum and to exchange experience. Despite, perhaps because of, the marginal nature and welfare-orientation of so many 'women-in-development' programmes, despite the non-supportive macro and macho environment in which they operated, there were useful lessons to be learnt. For example, the insights gained into the capacity of the poorest women to mobilise and maximise scanty resources and with that capacity came talents for leadership waiting to be tapped; the need and possibilities of breaking social barriers to open up partnerships of elite and grassroots women: the participatory, non-authoritarian structures in which women worked best.

Networks coalesced around these and other issues and their interaction intensified noticeably in the second half of the Decade, appropriately so, as the 1980s witnesses the developing world plunge into multiple socio-economic crises of unprecedented proportions. National resources, hostage to escalating foreign debt, seemed inadequate to resolve problems of unemployment, hunger, environmental decline and myriad forms of social malaise; the West retreated from multilateralism and into inward-looking fiscal conservatism; structural adjustment policies designed by international financial institutions to guarantee debt repayments bore most severely on the poorest households in the Third World which were increasingly female-headed.

The crisis of survival challenged women to pull their networks more tightly together and to begin to synthesise alternative visions of development. DAWN (Development Alternatives with Women for a New Era) was the statement of one such vision. It was presented to Nairobi Forum '85 by an informal open-ended group of Third World women researchers, activists and policymakers, and became the centre-piece of much of the discussion on development which took place. It aimed at producing a theology and methodology for change, one without gender bias, one which could redefine and reconstruct the macro concepts and modalities which determine development, for example, capital, labour, technology. Women see themselves, empowered equally with men, able to humanise and democratise such processes.

Primarily a vision of the developing world, more and more women of the industrial West have found in it a common interest, for they have not been immune from the effects of economic crises, and for growing numbers, the 'feminisation of poverty' is a reality. They joined Third World women in calculating and questioning the economics and the politics of military budgets which in the 1980s reached proportions that defy comprehension. Where is the rationality, not to mention humanity, as the DAWN statement expressed it, 'in a situation where nuclear missiles can go from Western Europe to Moscow in six minutes, while the average woman in Africa must walk several hours to fetch water for her family?'

If the issue of guns-and-butter has meaning for anyone, it has meaning for women. Not surprisingly, it was the Decade's third goal, that of peace, which brought out the most determined feminist vanguard and gave the global movement its cutting-edge. This had not been written into its original script. For during the exchanges between governments at the United Nations, preceding International Women's Year, peace became part of the Decade's triple themes, with the more or less clear understanding that women would not take it too seriously; they would confine themselves to 'women's issues': on political matters, like the arms race or regional wars, which were men's business, they would naturally hold their peace.

Women of developing countries, and men, confounded these expectations. In Mexico, in 1975, they made the political situation in Vietnam, Panama, (the then) Rhodesia, South Africa, the Middle East, Chile integral to their analyses of female status in those sensitive spots. Further, they identified imperialism, colonialism, neo-colonialism, foreign domination, racism, Zionism as forces which generate conflict and simultaneously obstruct women's advancement. This conviction found its way into the documents of Mexico—subsequently also into those of Copenhagen—and outraged the Western world, male and female. The international women's movement was fractured before it had even properly taken shape.

The willingness of women from the Third World to collaborate with their countrymen against the many '-isms' which had impact on their lives was seen by the West as a betrayal of the transcendental -ism, feminism. The inference was that they had been 'conned' by the (male) enemy into espousing the irrelevant and unseemly; in contrast, their Western sisters were strong-minded enough to resist any such manipulation. Given, however, the might of the patriarchal political

and media establishments of the West, with their ideological and strategic interests also to defend, it is at least arguable that Western women who excluded political issues from their agenda, were no less vulnerable to male persuasiveness than Third World women who included them in theirs.

By 1985, in Nairobi, there was markedly more convergence of war and peace concerns of women than there had been in Mexico City or in Copenhagen. Not that women of the South had recanted, but rather that Western women had come closer towards acknowledging the primacy of the political.

The course of change had been both theoretical and empirical. Feminist thinking has been extended by the cultural, racial and national diversity of the female experience, both historical and contemporary, on which it draws for its rationale. A growing consensus rejects the notion of artificially divided private and public spheres of action, scrutinises the many faces of male power, and traces the dialectical linkage between domestic and global violence. The concept of 'politicising' is demystified, individual liberation fuses with the collective: 'What is most personal becomes also most political'. Women of the Southern continents know this better than most. In the case of North America and Europe, peace and disarmament movements with their long record of women's involvement, have since the end of World War II retained their vigilance in the face of a superpower arms race which threatens one day to propel nuclear rivalry even into space.

In the Third World, which is the arena of today's wars, it is the down-to-earth horrors of daily death and devastation that drive women of the Middle East, Southern Africa, Asia, Central America, to seek, above all, peace. Without an end to conflict in these troubled regions, equality and development with employment, health, education, shelter for women and men alike are unattainable, and the often proclaimed indivisibility of the Decade's goals remains empty rhetoric.

The logic of this view, a strongly-held Third World view, has compelled respect. Its influence on European and North American peace movements has been a factor in shifting them to some degree, from minimalist and often isolationist stances, towards wider concerns.

Women from North and South, East and West, working in many instances out of inter-faith networks have been vital to this process. They gave to the Nairobi assembly a moral lift which was most strongly felt in the Peace Tent of the non-governmental Forum '85, the venue of its most intense political debates. No antagonisms were too ancient or

bitter to be aired there, each receiving its equal time. Women coming from every side of every peace-threatening issue on the international agenda entered and listened to the other side in an environment designed with care, not to aggravate, but to defuse conflict. By wide acclaim that singular place became 'the heart and conscience' of Forum '85, an enduring symbol of the Decade's end, a unique creation of women.

Women's passionate and compassionate involvement at Forum '85 in every political flashpoint in the world has profound significance for the international feminist movement. The 14,000 women present there, for the most part, ignored the solemn injunctions issued to them throughout the Decade by male establishments instructing them to stick to their own affairs. They chose, however, to decide that not only equality and development but peace, with its dark side of war, were also their affairs. And, above all, at a time when militarism and its main ally, racism, had never been more life-threatening. The issue for women gathered in the continent of Africa in 1985 was not which war and peace item should be addressed or where it should be debated, whether in the United Nations or elsewhere. The issue for women was their unqualified right to be part of the analyses and part of the resolutions of regional and global conflicts, indeed of all that shapes the human condition. And enough of tokenism. The fact that they seized the Decade's end so vigorously in Nairobi, and so extensively explored its tabooed issues outside governmental and inter-governmental structures is a measure of that vast reservoir of people's energy and commitment charged, and ready to mobilise, outside such structures, if need be.

Forum '85 was the Decade's final liberating act of women's collective defiance. It did not carry them into the labyrinthine corridors of power: that takes time. But a Decade has been time enough for women to chart the route and to be firmly on their way.

Third World cooperation on Pacific marine mineral resources

Within the last decade, increased marine awareness on the part of many of the world's developing nations has resulted in the widespread unilateral extensions of national jurisdiction up to 200 miles and more from shore. This world sea enclosure movement has transferred one-third of former high seas, and most known ocean resources and related activities to the control of individual states. Much of the southern and western Pacific is encompassed by these extended jurisdictional claims (Figure 1), and in the South China Sea, for example, there is almost no marine area left unclaimed and many areas where claims overlap (Figure 2).

In the 200 miles exclusive economic zone (EEZ), the United Nations Convention on the Law of the Sea (UNCLOS) gives nations sovereign rights over, among others, the mineral resources on and beneath the seabed. It also gives nations jurisdiction over marine scientific research and the protection and preservation of the marine environment.¹ Increased marine awareness and the extended maritime jurisdiction movement were stimulated by a marked increase in scientific knowledge, the rapid advance of exploitation technology and the expectation of enlarged resource bases. In the Pacific basin and on its margins these expectations are not without foundation. Known resources within Third World countries' EEZs include petroleum, manganese nodules, cobalt-rich manganese crusts, and polymetallic sulphide deposits.

Present offshore production of petroleum in the Pacific region excluding the United States, averages about 1.6 million barrels of oil and 2.6 billion cubic feet of gas per day (Table 1). Considerable petroleum potential remains to be discovered on the continental shelves of the major land masses bordering the Pacific, in deeper water on the continental slope and rises of the marginal basins surrounding the

Pacific, and perhaps behind the small island arcs in the western and southwestern Pacific. Further potential exists in pre-Tertiary sediments underlying already productive basins, and in gas hydrates (gas and water in the solid state) in sediments in deep water. These gas hydrates may also form an impermeable seal capping free gas and oil. As an example of the worth of this potential, the estimated total gross value of undiscovered oil and gas resources in Southeast Asia ranges from

1.1–11.0 trillion US dollars.² In Northeast Asia it is between 0.4 and 4 trillion, and in Oceania it is at least 0.5 to 6 trillion dollars. This estimate for Oceania does not include resources expected in Tonga, Vanuatu, the Solomon Islands, and most important, Papua New Guinea³ which could be worth as much as another trillion dollars. By comparison, the US Pacific area including Alaska might harbour 0.3 trillion dollars worth of oil and gas.⁴

Of more recent interest are cobalt-rich manganese crusts reported from seamounts in the Hawaiian and Line Islands at depths between 1,100 and 2,600 m on seamounts. The thickness of crusts reaches 7 to 9 centimetres and averages 2.5 centimetres. Crusts contain a mean of 25 per cent manganese, 0.8 per cent cobalt, 0.5 per cent nickel, 0.07 per cent copper and 0.0005 per cent platinum. A seamount may contain between 2 and 4 million tons of crust approximating the amount of ore required for a year's production of a commercial deep-sea mine. The concentration of cobalt is about 1 per cent—greater than cobalt ores mined on land—and the current market price of cobalt (\$27.56/kg), is about five times that of nickel (\$4.98/kg) and fifteen times that of copper (\$1.77/kg).

Total values of cobalt, nickel, copper and molybdenum in Mid-Pacific mountains and Line Islands crusts from water depths less than 2,600 m are \$170 to \$202 per wet ton of crust or \$340 to \$808 million worth of wet ore per deposit, not counting platinum.⁵ The EEZs around the Hawaiian islands and around Johnston and Palmyra islands contain an estimated 10 million tons of cobalt, 6 million tons of nickel, 1 million tons of copper and 300 million tons of manganese. A prime mine site might contain \$165/metric ton of cobalt, \$37.5/ton of nickel, \$1.32/ton of copper and \$43.57/ton of manganese for a total of \$247.74/ton of ore, or perhaps \$4 of gross contained metal value per square metre. More deposits have recently been found in the western

deposits contain up to 21 per cent copper, 50 per cent zinc and 45 per cent iron.

Manganese nodules containing nickel, copper, cobalt and manganese had long been considered the prime economic mineral resource in the deep sea.⁹ There are about 10 trillion tons of nodules in the Pacific. However, only a small portion of these deposits contain the economic cutoff percentage of 2 per cent nickel plus copper plus cobalt and are found in concentrations greater than 10 kg per m² over an area sufficient for twenty years production. The highest concentration of nodules (more than 8 kg/m²) with the highest nickel plus copper (at least 1 per cent combined content) are found between 3,200 m and 5,900 m in the northeast Pacific (Figure 1). Mean values of potential mining sites here have the following ranges: manganese 22 per cent to 27 per cent; nickel 1.2 per cent to 1.4 per cent; copper 0.9 per cent to 1.1 per cent; cobalt 0.15 per cent to 0.25 per cent. Chile, Mexico and French Polynesia may have economic-grade nodule fields within their EEZs. In the South Pacific, nodule distribution is more irregular; one area of concentration is around the Manihiki Plateau, the Society Islands, Tahiti, and the Tuamotu Archipelago. More to the south, nodules occur west of the East Pacific Rise and northeast of New Zealand. Another nodule area lies in the circumpolar region of Antarctica. In the northern Peru Basin nodule density is 7 to 14 kg/m² up to 30 kg/m² with 1.1 per cent to 1.2 per cent nickel and thus may be of economic interest.

Manganese nodules might be mined in the 1990s when economic, technical, legal and political factors are more favourable. In a first phase of mining, about 0.6 million km² in the Northeast Pacific nodule belt and 2 million km² in the total Pacific may contain fields of sufficient nodule density, weight and metal content (Table 2). The *in situ* reserves amount to 16 billion tons of nodules in the first phase with recoverable reserves of 5.6 billion tons. The area for each mining site would be between 80 thousand km² and 120 thousand km². There would be space and abundance for at least forty to forty-five mining sites in the Pacific during a first generation of deep-sea mining.

Manganese nodules have been known for over 100 years but valued economically for only about twenty years and have become commercially retrievable within the last ten years. The Red Sea brines and metaliferous muds were discovered and delineated within the last twenty years; deep-sea hydrocarbons were frequently encountered by

⁹ Halbach, *op. cit.*, pp 42, 45-7, 55-8.

the Deep Sea Drilling Programme during the last fifteen years, and metallic sulphides and cobalt-rich crusts have become known only within the last decade. We are just now beginning to understand the origin and distribution of these deposits. Surprises continue. What else of economic value might be found on and beneath the ocean floor?

Cooperation in marine scientific research and exploration

The fundamental necessity for international cooperation in deep-sea mineral exploration derives from the superimposition of a mosaic of man-made resource claims on transnational geologic, oceanographic and resource systems. The distribution of economic concentrations of deep sea petroleum and mineral deposits such as manganese crusts and nodules, and metallic sulphides, depends on such variables as the age of the sea floor, and paleo-oceanography, including paleo-sedimentation rates and paleo-ocean circulation. These variables in turn depend on a detailed understanding of sea floor spreading and plate tectonics. Sea

floor spreading and plate tectonics provides a framework for integrating individual bits of geologic data. Understanding of these variables requires geologic knowledge over areas considerably greater than an individual country's EEZ—even a Pacific island EEZ. If the giant geologic jigsaw puzzle is incomplete, so will be the understanding of the origin and distribution of these deposits, thus weakening the ability to predict their economic occurrence.

For example, the geologic history and origin of the South China Sea is not likely to be confirmed without data from many countries' areas within and peripheral to the Southeast Asian seas. There is a hypothesis that the South China Sea was formed by sea-floor spreading and rifting of the Reed Bank area—northern Palawan Island away from the Macclesfield Bank area and the Paracel Islands. To test this hypothesis, a match-up of the marine geology of these segments is necessary. This could best be accomplished through collection of geologic and geophysical data along transects from the inner Chinese margin all the way across the Dangerous Ground, which is claimed in whole or in part by China, Taiwan, Vietnam, the Philippines and Malaysia. Other specific pieces of knowledge important to this synthesis and requiring international cooperation for their acquisition include the origin of the peripheral ridge underlying the continental margin throughout the sea and an evaluation of a possible triple junction off central Vietnam. Such gaps in knowledge could be closed most efficiently through regional or sub-regional cooperative scientific programmes. It is only by piecing together these bits of information from different geographic areas on a synoptic basis that those questions can be scientifically answered.

Another reason for cooperation is that the indigenous marine resource capabilities in the developing countries of the Pacific region are inadequate for supporting the exploration and development of minerals and petroleum. As an example, Table 3 provides the number of indigenous ocean scientists, research vessels and expenditure for marine research in each of the nations bordering the South China Sea. The number of ocean scientists ranged from six in Singapore to 126 in Thailand, the number of research vessels from zero in Singapore to thirty-five in China, and the amount of government expenditures for ocean research from US\$26,300 in Indonesia to US\$2,090,000 in Thailand. Of these countries only Thailand might be considered to have adequate capabilities for the ocean research necessary to lay the foundation for offshore petroleum and mineral exploration, but in Thailand most of this capability is concentrated in fisheries research.

Table 3: Marine science manpower facilities and research expenditure

Singapore has the least such indigenous capability.¹⁰ The indigenous capabilities of the Pacific island nations is less than or, in Fiji and Papua New Guinea, about the same as that of Singapore. Through cooperation, knowledge and personnel could be pooled to carry out research and development on problems of common interest, easing the financial burden of each member-country and producing synoptic coverage over a longer period and in a wider area.

There has already been some sub-regional cooperation between Pacific developing countries in marine minerals scientific research, as well as some developed country and international organisation assistance to them in these cooperative endeavours. The Economic and Social Commission for Asia and the Pacific's (ESCAP) Bangkok-based Committee for Coordination of Joint Prospecting (CCOP) for Mineral Resources in Asian Offshore Areas attempts, through its technical and executive arm, the UNDP Project on Regional Offshore Prospecting in East Asia (EA), to stimulate and coordinate development of offshore mineral resources in the region. The Committee's membership does not include all of the South China Sea littoral countries but does include as 'cooperating countries' the Soviet Union, the United States, and Japan among others. The Intergovernmental Oceanographic Commission sponsors the Working Group for the Western Pacific (WESTPAC). Several specialised UN agencies whose terms of reference include marine problems have offices in the region eg, the UNESCO Regional Office for Science and Technology for Southeast Asia in Jakarta, and the Minerals Section of the Natural Resources Division of the Economic and Social Commission for Asia and the Pacific in Bangkok. There is also a plethora of UN-sponsored or supported national projects as well as bilateral assistance in marine mineral exploration in the region.¹¹

The UNDP-funded, ESCAP-administered CCOP for Mineral Resources in the South Pacific (CCOP/SOPAC) based in Fiji is organised and functions for the South Pacific in a manner similar to that of CCOP/EA. French marine research laboratories such as Office de la Recherche Scientifique et Technique Outre-Mer (ORSTOM) with branches in Tahiti, New Caledonia and Vanuatu, and the Centre

National pour l'Exploitation des Océans (CNEXO) in Tahiti conduct geological and geophysical research in the region as do vessels from Australia, New Zealand, West Germany, and the United States under bilateral access agreements. Soviet and Chinese research vessels have also been active there.

But this cooperation and assistance is inadequate for the task of exploring for offshore petroleum and mineral deposits. And the bulk of marine scientific research has been and will continue to be done by foreign maritime powers. In the context of negotiations for development of any deposits in developing countries' EEZs, knowledge is indeed power. But then so could be the newly won control over access by foreign vessels for scientific research. According to UNCLOS, marine scientific research in the EEZ and on the continental shelf can only be conducted with the consent of the coastal state.¹² Coastal states may withhold their consent for the conduct of a marine scientific research project of another state or international organisation in its EEZ or on its continental shelf if that project is of direct significance for the exploration and exploitation of living or non-living natural resources.¹³

Coastal states should be aware that under the new consent regime, maritime powers may attempt to use affiliation with international organisations to gain access for their marine scientific research vessels to gather data which may later be used to their advantage. According to UNCLOS, a coastal state which is a member of, or has a bilateral agreement with an international organisation, shall be deemed to have authorised a project if it approved it when the decision was made by the organisation to undertake the project or if it did not object within four months of notification of the project by the organisation to the coastal state.¹⁴

The UNCLOS does provide the coastal state with the rights to participate free of charge or be represented in the marine scientific research especially on board research vessels (when practicable); to obtain preliminary reports (as soon as practicable) and the final results and conclusions after the completion of the research; to access to all data and samples derived from the marine scientific research project;

¹² United Nations, *op. cit.* in n. 1, Article 246 para. 1 (marine scientific research in the exclusive economic zone and on the continental shelf).

¹³ *ibid.*, 15a.

¹⁴ United Nations, *op. cit.* in n. 1, Article 247 (marine scientific research projects undertaken by or under the auspices of international organisations).

and to an assessment of such data, samples and research results, or assistance in their assessment or interpretation.¹⁵

It is well known that maritime powers sometimes exert pressure in other spheres to gain access to resources in developing countries' EEZs. In this context, states could coordinate their access policies to share information on access requests and to deny access to those entities which undertake unauthorised marine scientific research or research in windows between EEZ claims, violate terms and conditions of access, exert pressure in other spheres, or proceed unilaterally to explore and exploit the common heritage area.

Thus the need for cooperation among developing nations in marine scientific research matters derives from the transnationality of marine geology, insufficient indigenous marine scientific research capabilities, and the need to reinforce each other's policies on access for marine scientific research by foreign nations, as well as Third World legal interpretations of relevant UNCLOS provisions. There has already been a tremendous degree of coordination and cooperation at the policy level among developing Asia/Pacific countries on Law of the Sea and related matters. They acted as a bloc (unsuccessfully) supporting the siting of the International Seabed Authority in Fiji. They support national ownership of tuna fish and many of the Pacific island countries are members of the South Pacific Forum Fisheries Agency which has promulgated an agreement black-listing vessels which violate members' terms of access to EEZs, and many Pacific island countries have endorsed a nuclear-free zone treaty for the South Pacific. Such cooperation could and should be extended to implementing the transfer of marine science technology and know-how to the Third World.

The UNCLOS calls upon signatories to promote the development of the marine scientific and technological capacity of developing states which may need and request technical assistance for the exploration, exploitation, conservation and management of marine resources, the protection and preservation of the marine environment, and marine scientific research with the purpose of accelerating their social and economic development. This is to be done by fostering favourable economic and legal conditions for the transfer of marine technology, establishing programmes of technical cooperation for the effective transfer of all kinds of marine technology, including meetings on scientific and technological subjects, particularly on policies and

United Nations, *op. cit.* in n. 1, Article 249 (duty to comply with certain conditions)

methods for the transfer of marine technology, promoting the exchange of experts, and promoting joint ventures and other forms of bilateral and multilateral cooperation.¹⁶ To put teeth in these provisions, states might coordinate their requests for training and transfer of technology and link them to access arrangements. For example, the ASEAN Committee on Science and Technology (COST) has a Working Group on Marine Sciences, which has discussed the possibility of a cooperative approach to extra-regional access for marine scientific research, and has successfully approached the United States for funding of an ASEAN marine sciences programme.¹⁷

The obligations of developed country signatories of UNCLOS include the establishment of national and regional marine scientific and technological centres in the developing world. The functions of such regional centres are supposed to include among others: (1) training and educational programmes at all levels on marine biology, including conservation and management of living resources, oceanography, hydrography, engineering, geologic exploration of the sea bed; mining and desalination technologies; management studies; the protection and preservation of the marine environment; and the prevention, reduction and control of pollution; (2) organisation of regional conferences, seminars and symposia; (3) acquisition and processing of marine scientific and technological data and information; (4) prompt dissemination of results of marine scientific and technological research in readily available publications; (5) publication of national policies with regard to the transfer of marine technology, and systematic comparative study of those policies; (6) compilation and systematisation of information on the marketing of technology and on contracts and other arrangements concerning patents; and (7) technical cooperation with other states of the region.¹⁸

As a hypothetical example, an Asia/Pacific Institute for Marine Resources Management (APIMARE) could undertake research and education/training in the Asia/Pacific region, for Asia/Pacific developing nations, and as far as is feasible, by nationals from Asia/Pacific developing countries. The institute would not be narrowly

¹⁶ United Nations, *op. cit.* in n. 1, Article 269 (measures to achieve basic objectives). There are also provisions for technology transfer by contractors working under the regime of the International Seabed Authority. United Nations, *op. cit.* in n. 1, Article 144 (transfer of technology), Annex III Article 5 (transfer of technology) and Article 15 (training programmes).

¹⁷ Valencia and Evering, *op. cit.* in n. 10.

¹⁸ *Ibid.*, Articles 275-7 (establishment of national centres; establishment of regional centres; functions of regional centres).

and esoterically individualistic and scientific, but would focus international, multidisciplinary teams on resource exploration, assessment, sustained development and management in support of regional goals. These teams would provide technical support to formal and informal regional committees and respond to *ad hoc* regional requests for resource management studies. Highest priority would be on truly shared resource management problems that can only be solved by gathering data from several countries' areas. Priorities among shared resource management problems would be strongly influenced by the size of the potential economic benefits and the number of member-countries that would directly benefit by a solution to the problem. Second priority would be on issues held in common but not transitional in themselves and again priorities among common problems would be influenced by the potential economic benefit and number of member-countries desiring the research. Research to only one nation's benefit would be of lowest priority and on a rotating basis. The institute would serve as a node and clearing house for access for requests for scientific research by foreign nations and international organisations, and offers of, and requests for technical assistance. Such research and technical assistance would have to fit the institute's existing research agenda. The institute would also be a central data bank, and a coordinator and implementor of human resource development for marine resource management.

Because most marine science data in the region has been and is still collected and analysed by scientists of countries external to the region, APIMARE would be a focal point for a massive marine science knowledge and technology transfer to the region and where knowledge and personnel could be pooled to carry out research and development on problems of common interest. Thus cooperative marine resources research may be the key to realising the development benefits of the new resources in extended jurisdictional zones.

The research agenda would include as over-arching themes the present and potential economic costs and benefits of exploration/exploitation of the resources known or expected in the new jurisdictional space; the present and projected role of marine resources in development; multinational sea-use planning and management; the role of new national marine resources such as oil, minerals and space for navigation in the implementation of global concepts such as the New International Economic Order or a Pacific Community; and identification and evaluation of possible consortia of developed and

developing Asia/Pacific countries to harvest these new resources.

Sector themes would include fisheries, hydrocarbons and minerals, environment, climate/weather, and shipping. Research in fisheries would include assessment of shared stocks, eg, scads, mackerels, sardines and tunas; evaluation of 'surplus' in national exclusive economic zones; harmonisation of fisheries management regulations and techniques; amelioration of national offshore/artisanal fishermen conflicts; amelioration of transnational fisheries conflicts; and identification and evaluation of possible Asia/Pacific cooperation in fish catching, processing, distribution, and marketing. Research in hydrocarbons and minerals would include assessment of resources in areas of overlapping claims in Asia/Pacific nations and in shared basins; cross-jurisdictional research of plate tectonics and its relation to hydrocarbon and ore deposits; and identification and evaluation of possible Asia/Pacific cooperation in hydrocarbon exploration, refining and marketing.

Research in environment would include standardisation of sampling and analytical techniques and equipment; assessment of marine environmental quality in shared and adjacent areas; assessment of pollution effects on shared and common living resources; assessment of the transnational effects of deterioration of national marine ecosystems; harmonisation of regulations; and identification and evaluation of possibilities for Asia/Pacific cooperation in marine environmental protection and management. Research in climate/weather would include typhoon generation; tsunami generation; disaster preparedness; and monitoring of major oceanographic systems and weather forecasting. Research in shipping would include surface circulation; tides and tidal phenomena; and identification and evaluation of possible Asia/Pacific cooperation in shipping.

There are a number of policy questions which would need to be addressed before implementation of APIMARE. Would potential funders such as the United States, Japan, Canada and the EEC be willing to contribute jointly or would each wish to fund a separate organ or separate national programmes? Would indigenous funding in cash or in kind, up front, or later, be necessary, desirable or likely? How much initial capital would be required to form a critical mass of staff and facilities, and how much would be required for annual operations? After raising the initial capital, would it be preferable to support operations by interest from a trust fund like the United Nations University or by grants for specific projects, or both?

What should be the criteria for membership and what should be the status of developed countries who wish to contribute, and/or work with the organisation? Should there be subsidiary bodies for particular geographic regions, eg, Northeast Asia, Southeast Asia, and the Pacific islands? How should the organisation be governed? What criteria should be used in determining specific research priorities? How much effort should be devoted to scientific research, and how much to resource policy studies, and to education/training? Should APIMARE offer degrees or certificates?

Given APIMARE's mission of technology and knowledge transfer, it may be impractical to begin initially with an all ASEAN staff. What should be the indigenous/exogenous proportions of staff in research, education/training, and administration? Should salaries be on an international scale or on a par with comparable host country positions? The views of both potential member-countries and potential donors should be sought on these and other funding and organisational questions in a feasibility study. On this basis, a concrete proposal could be developed and promoted by potential member countries in their dealings with maritime powers active in the Pacific.

Cooperation in negotiations with multinational companies

Some of the new mineral deposits are, or are likely to be owned by countries who wish to benefit from their development but which lack the capital, technology, know-how and markets of those countries which value the mineral most and wish to obtain it. Can these new national marine mineral resources be of importance in the implementation of global concepts such as Pacific Basin Economic Cooperation or a New International Economic Order (NIEO)? Are consortia of developed and developing countries to harvest these resources economically feasible and politically acceptable?

Among others, the NIEO calls for transfer of basic foreign-owned assets to national control helping to create a new industrial geography, and for social control of technology.¹⁹ According to NIEO supporters, the incipient Pacific marine mineral mining industry should not become another foreign-controlled sector of Third World economies. They believe that national economic sovereignty includes the rights to

¹⁹ *The 1975 Dag Hammarskjöld Report on Development and International Cooperation*, Part II: 'Towards a New International Order, an agenda for negotiations between Third World and industrialised countries,' pp 88-102.

produce, allocate production and determine who may produce, and the rights to acquire and regulate the use of assets within a country. They also feel that contracts based on radically unequal knowledge can be unilaterally abrogated. They recommended a minimum code of conduct and an international data-collection, compilation-analyses and recording system to make the workings of transnational companies more manageable.

Such provisions for Pacific miners could be collectively urged by the resource owners. The definition of how to evaluate assets, the identification of relevant historical and economic circumstances—past profit remittances, tax treatment, transfer prices—and the use of clauses providing for automatic or contingent negotiation of long-term agreements are among the guiding principles needing cooperative action. Thus, there may be an opportunity here for resource-owning Third World countries to own, manage, administer and market their *own resources*. This would avoid an oft-repeated, long drawn-out process of bickering and confrontation over the effective control of natural resources. The sooner effective national control is achieved, the better conditions for international cooperation will be.

In the view of NIEO theorists, this exercise of national economic sovereignty would aid the transition towards a new industrial geography of the world. Production would then be located where a large number of the production factors are found, rather than in the market centres where most mineral commodities are now imported and processed. Although mining, processing and conversion to industrial commodities of marine minerals in the Pacific might implement this transition, this new geography—according to NIEO supporters—should not be planned and implemented by transnational corporations solely according to their own interests and objectives, eg concentrating projects exclusively in larger, better endowed, more industrialised developing countries. Usually, according to these theorists, financial transfers have been used as a political instrument to stimulate growth of those countries who do not pose any threat to existing power relationships while withholding it from those which have undertaken radical structural transformation of their societies and economics. Avoided should be types of production that will only result in a new, unequal and dependent structural relationship with industrialised countries.

One way to ensure a cohesive, coherent approach to multinational corporations in this virgin area by small isolated island nations is for

them to jointly develop and promote similar fundamental parameters of their exploration contracts. While the specifics of the financial aspects may vary with the risk involved, similar types of agreement and fundamental features could avoid divide and rule tactics. Such features could include the duration and obligations of the exploration and exploitation phases, national company participation, if any, royalties, taxation, cost recovery provisions, and training/technology transfer features. The UNCLOS promotes the establishment of generally accepted guidelines, criteria and standards for the transfer of marine technology to developing countries.²⁰

Another possibility for developing nations is to form consortia to undertake sea-bed mining in the common heritage area under agreement with the International Seabed Authority. India, for example, is one of only four presently qualified pioneer investors under UNCLOS Resolution II and might be interested in spearheading such a head-start, joint venture.²¹

Joint development in areas of overlapping claims

According to UNCLOS, coastal states may, in addition to a 200-mile EEZ, claim a continental shelf throughout the natural prolongation of their land territory to the outer edge of the continental margin, but not exceeding 350 miles from baselines.²² Coastal states can also claim submarine elevations that are national components of the continental margin, like plateaux, rises, caps, banks and spurs.²³ On the continental shelf the coastal state has exclusive sovereign rights for the exploration and exploitation of non-living resources of the seabed and subsoil²⁴ except that the coastal state must share the proceeds from the exploitation of non-living resources of the shelf beyond 200 miles from baselines.²⁵

The delimitation of the continental shelf between opposite or adjacent states is to be effected 'according to equitable principles',²⁶ a

²⁰ United Nations, *op. cit.* in n. 1, Article 271 (guidelines, criteria and standards)

²¹ Conference Report, Preparatory Commission, 'The long road to success,' *Marine Policy* 8(4) 1984, pp 363-6.

²² United Nations, *op. cit.* in n. 1, Part IV (continental shelf), Article 76 (definition of continental shelf), para. 1.

²³ *ibid.*, para. 6.

²⁴ *ibid.*, Article 77 (rights of the coastal state over the continental shelf), para. 1, 4.

²⁵ *ibid.*, Article 82 (payments and contributions with respect to the exploitation of the continental shelf beyond 200 nautical miles), para. 1.

²⁶ *ibid.*, Article 83 (delimitation of the continental shelf between states with opposite or adjacent coasts), para. 1.

vague concept which in application has different meaning for different states. Islands may be used to claim EEZs and continental shelves. Disagreement over baselines, particularly over certain islands as basepoints for maritime claims, and disagreement over the interpretation of various legal and equitable principles leads to overlapping claims to continental shelves and EEZs. In cases of overlapping claims, UNCLOS provides that states shall make every effort to enter into provisional arrangements of a practical nature and that during the transitional period they shall not jeopardise or hamper the reaching of the final agreement.²⁷ Given that mineral discovery and development is a common high priority among developing nations, international joint development—the setting aside of the actual boundary question and jointly exploring for, and exploiting the mineral wealth in an agreed area of overlap—may be one such ‘arrangement of a practical nature.’

There are at least eight unresolved boundary situations in the southwest Pacific which might lead to overlaps and controversies,²⁸ particularly if mineral deposits are suspected or discovered in the overlap areas. Between Fiji and Tonga, the frame which was drawn around the Kingdom of Tonga in 1887, and within which Tonga still claims all rights, overlaps 4860 nm² of waters and seabed which Fiji can claim. Also, Tonga's claim to Minerva Reefs an islands could increase Tonga's claimed area by 56,500 nm² at the expense of 18,500 nm² of Fiji's area. The boundary between Western Samoa and American Samoa is unsettled and Western Samoa may not accept Swain's Island as a fair basis for restricting its claim in the northeast. Papua New Guinea's claim extends east of an equidistance line and encloses a 6,500 nm² area which could be claimed by the Solomon Islands. A disagreement between New Caledonia and the Solomon Islands would arise if New Caledonia rejected the Solomon Islands' archipelagic baseline around Indispensable Reefs; this would place the equidistance line thirty miles to the north. A dispute between New Caledonia and Vanuatu may arise over the ownership of Hunter and Matthew islands and the 53,800 nm² of sea and seabed that can be claimed from them.

²⁷ *ibid.*, para. 3.

²⁸ J R V Prescott, 'International maritime boundaries in the southwest Pacific Ocean' in *Law of the Sea and Ocean Development Issues in the Pacific Basin*. (Proceedings of the Law of the Sea Institute 15th Annual Conference) Edward L Miles and Scott Allen (eds), Honolulu, Hawaii: Law of the Sea Institute, 1981; J R V Prescott, 'Existing and potential maritime claims in the southwest Pacific', in *Ocean Yearbook 2*, Elizabeth Mann Borgese and Norton Ginsburg (eds), Chicago: University of Chicago Press, 1980, pp 317–45.

There is also a potential problem between New Caledonia and Australia because of tiny outlying islands claimed by each and the necessity to determine which of these islands can be used as points on baselines from which the boundaries will be determined. Further, the Lord Howe Rise itself, on which these islands lie, is separated from the continental margins of these two countries by deep zones. The Lord Howe Rise is thus a continental margin beyond the 200-mile claims of Australia, New Caledonia, and New Zealand and must be divided among them.

There are many areas of unresolved boundaries in Southeast Asian seas which may contain petroleum or mineral resources (Figure 2).²⁹

Shallow water (less than 200 metres)

- Malaysia–Thailand—a quasi-triangular-shaped area in the southwestern Gulf of Thailand resulting from disagreement over the effect to be given to Thai islands in drawing an equidistant line, although the two countries signed a memorandum of understanding on 21 February 1979 recognising the overlapping claims and agreeing to establish a joint authority for the exploitation of seabed resources in the disputed area.

- Indonesia–Vietnam—a large trapezoid-shaped area north of the Natuna Islands where Vietnam claims natural prolongation of its land territory to a depression just north of the Natuna Islands, and Indonesia claims the equidistant line between Indonesia's archipelagic baseline and Vietnamese territory.

- Indonesia–Malaysia—a contorted triangular-shaped area extending northeast from the Sarawak–Kalimantan land boundary where the agreed continental shelf boundary is not coincident with an equidistant line.

- Brunei–Malaysia—a triangular-shaped area where the United Kingdom, on Brunei's behalf, claimed more shelf area than it was entitled to by an equidistant line.

- Burma–India—a small semicircular-shaped area produced by Burma's controversial baseline across the Gulf of Martaban.

- Thailand–Kampuchea–Vietnam—a large part of the eastern Gulf of Thailand resulting from disagreement on ownership of islands and

²⁹ J R V Prescott, 'Maritime jurisdictional boundaries' in *Marine Policy in Southeast Asia*, George Kent and Mark J Valencia (eds), Berkeley: University of California Press, pp 64–6. Daniel Dzurek, 'Boundary and resource disputes in the South China Sea,' in *Ocean Yearbook* 5, Chicago: University of Chicago Press, pp 254–84.

the effect to be given to various islands in drawing equidistant lines, and on the azimuth of projections of land boundaries into the sea.

- Vietnam-China—an hourglass-shaped area resulting from Vietnam's claim that the boundary should be an 1887 Sino-French treaty line intended to allocate ownership of islands, and China's apparent claim of the equidistant line as the boundary.

- Malaysia-Singapore-Indonesia—a small belt of disputed area generated by conflicting claims by Malaysia and Singapore to Horsburgh Light or, more accurately, to the feature on which it stands; the result could affect Singapore's boundary with Indonesia.

Deep-water

- China (Taiwan)-the Philippines—a large triangular-shaped area in the Bashi Channel resulting from Taiwan's declaration of an EEZ following the equidistant line and the Philippines' adherence to the treaty as territorial waters.

- Indonesia-the Philippines—a small triangular-shaped area south of Mindanao where Philippine treaty (territorial) waters extend beyond an equidistant line between Philippine and Indonesian archipelagic baselines.

- Malaysia-the Philippines—a triangular-shaped area off northeast Sabah in the Celebes Sea where Malaysia's continental shelf claim from a controversial baseline extends beyond lines of equidistance using various islands. There also are two small slivers of area here disputed by Malaysia and Indonesia because Malaysia's unilateral claim does not give effect to the Indonesian islands of Batuan Unarang and Pulau Maratua.

- Indonesia-Australia—a rectangular-shaped area south of East Timor where Indonesia claims the equidistant line and Australia claims a direct line joining existing agreed boundary segments.

- Malaysia-Vietnam-the Philippines-China—most of the central and northern South China Sea is claimed by China on historical grounds; all claim ownership of some of the Spratly Islands on various grounds.

- Indonesia-Australia—a large area to the west of the Timor 'gap' where Indonesia and Australia disagree as to the effect to be given to the Australian Scott Reef and Ashmore, Cartier, and Browse islands.

- Indonesia-Australia—a large semicircular-shaped area between Christmas Island and Java where Indonesia argues that the island does

not generate a right to a continental shelf because it is far closer (within 200 miles) to Indonesia than Australia.

Among the precedents for joint development, the agreements between Thailand and Malaysia,³⁰ South Korea and Japan,³¹ Saudi Arabia and Kuwait³² and Iceland and Norway³³ are sufficiently well-documented to delineate elements in common and their variation. Frequently appearing elements define the extent of the area, the contract type, financial arrangements, the process of selection of concessionaries and/or an operator, the length of the agreement, and the nature and functions of the joint management body.

Joint development does not have to be *in lieu* of a boundary; indeed boundaries were agreed in the land portion of the Saudi Arabia-Kuwait arrangement, and for the exclusive economic zones between Norway and Iceland. However, agreement on the extent of the area in question is fundamental to a joint development arrangement. In the Thai-Malaysia and South Korea-Japan cases, the area of overlap of the respective claims became the agreed joint development area. In the Saudi Arabia-Kuwait case the land portion of the joint development area was originally a neutral zone established as a buffer to prevent clashes of nomadic tribes. In 1965 a boundary was agreed and the zone was partitioned; however the partitioned zone, ie, the area covered by the neutral zone before partition, became the joint development area. The submerged area adjoining the partitioned zone has not been

partitioned and the two countries have agreed to joint exploration outside territorial seas of six miles.

In the Iceland-Norway case, the recommended joint development area is based on the extent of the prospective sediments and is 70 per cent on the Norwegian side of an agreed EEZ boundary. An interesting variation is the recommendation that if a field extends outside the joint development area into Icelandic shelf, then, Iceland should have sole rights to that portion in its territory, but if a field extends into Norwegian shelf, the whole field should come under the joint development scheme. In the Saudi Arabia-Sudan arrangement in the Red Sea,³⁴ the joint development area is that between the 1,000 m isobaths extending from each coast and includes the main Red Sea brine deposits. In the minority opinion recommendation for Tunisia-Libya, the joint development area would be that formed by lines deviating 10-15° on either side of an adjusted equidistance line.³⁵

If the two countries have different contractual systems, eg, concessions versus production-sharing, they must agree on one or the other. Also difficult are questions of respective management rights, taxation, and the allocation of financing. If the area is sufficiently prospective, financing could be arranged by private companies, but that must be agreed as must the choice of company. Thailand and Malaysia agreed to use a production-sharing contract system even though Thailand was using a concession system. The agreed tax formula amounted to half the total rates in both countries. Under the South Korea-Japan arrangement, each country names a concessionaire and taxes are collected by each party from its own concessionaire. The Saudi Arabia-Kuwait schemes uses concessions and OPEC tax rates, royalties, and prices, and production and maintenance costs. A joint venture contract was the recommended approach for the Norway-Iceland arrangement. The conciliation commission also recommended that each party participate with a 25 per cent share in joint ventures with oil companies in the other's portion of the joint development area, but that if no commercial companies become involved and the countries each finance exploration themselves in their own portions of the joint development area, Norway should carry Iceland's interest but Iceland should not be expected to do so.

³⁴ Ali A El-Hakim, *The Middle Eastern States and the Law of the Sea*, Syracuse, New York: Syracuse University Press, 1979, pp 180-5.

³⁵ Jens Evensen, Dissenting opinion, Case concerning the continental shelf (Tunisia/Libyan Arab Jamahiriya), International Court of Justice, Reports of Judgements, Advisory Opinions and Orders, Judgement of 24 February 1982, p 321.

In both the South Korea–Japan and Saudi Arabia–Kuwait land agreements, both parties nominate a concessionaire for the entire subzone or area and these concessionaires reach an operating agreement between them, or in the South Korea–Japan agreement, by drawing lots, if necessary. Saudi Arabia and Kuwait agreed on one operator for the offshore portion of the joint development area. No specific reference to a contractual system was made in the Saudi Arabian–Sudan agreement. However, it was agreed that Saudi Arabia would carry the interest of the Sudan for the activities of the joint commission.

The duration of the agreement must be decided as well as the reasons and procedures for terminating the agreement. A short-term agreement (say ten years) may provide impetus to hasten exploration and development but may also make investors shy away from a situation which will obviously change. A long-term agreement (say fifty years) provides a more stable investment climate but a longer commitment. The Thailand–Malaysia agreement is for fifty years or until the parties agree on delimitation. The South Korea–Japan arrangement is also for fifty years; however it can be terminated by mutual consent if the parties recognise that the natural resources are no longer exploitable. The Saudi Arabia–Kuwait agreement is of indefinite duration and can be terminated by either party. However a sixty-year concession in the area was given to one company.

There also needs to be agreement on the degree of autonomy and authority to be vested in the joint development body, if one is established. Should it be strong—a full legal person with powers to license, stipulate terms and exemptions and enter into contractual agreements with foreign companies—or should it be weak—simply a liaison or consultative body between national oil companies? In the Thailand–Malaysia case, a joint authority was established for the purpose of exploring and exploiting the non-living natural resources of the seabed and subsoil in the overlapping area. The joint authority assumed all rights, responsibilities, and powers on behalf of both parties in this regard, and for the development, control and administration of the area. The joint authority has a constitution; it has licensing powers; it can retain profit and will be taxed. It consists of two joint-chairmen, one from each country and an equal number of members from each country; there are one legal and two technical subcommittees. The governments jointly retained sovereign rights to the area and regulation

of customs, fishing, navigation, hydrographic and oceanographic surveys, marine pollution and security. Criminal jurisdiction was divided by a line equidistant between the two claim lines.

South Korea and Japan established the Japan–Republic of Korea Joint Commission with a mandate to review operation of the agreement and *recommend* action to the parties. The Commission has a permanent secretariat and a subcommittee of experts. However the operating agreement between the concessionaires must be approved by the parties and the laws of each party apply to its concessionaire if it is the operator. One interesting variation is that the Japanese Ministry of Agriculture, Forestry and Fishery must be consulted in approving the operating agreement and can restrict exploration and exploitation in designated fishing zones.

Saudi Arabia and Kuwait established a joint operating committee to supervise the concessionaires' field operators. The committee studies projects and new licences, contracts and concessions relating to exploitation of shared natural resources and recommends action to the respective Ministers of Natural Resources. It can sign contracts. A permanent consultative committee was recommended in the Tunisia–Libya case. The Saudi Arabia–Sudan agreement stipulated that a joint commission would be established to survey and delimit the common zone, carry out the requisite studies concerning the exploration and exploitation of the natural resources there, encourage specialised bodies to undertake exploration activities in the zone, and to look into applications for licences and concessions concerning exploration and exploitation in the common zone, and specifically, render a decision on the previous agreement between Sudan and Preussag for exploration rights.

Standard ingredients which may become important later include unitisation provisions for deposits which straddle the boundaries of the joint development area, and procedures and principles for conflict resolution such as direct negotiation, provisions for, or governing, conciliation commission or the International Court of Justice. Transfer of technology may be important, particularly if there is a great gap between the technical levels of the two entities, or if political difficulties exist between one of the partners and the home country of interested companies, eg, Vietnam and the US.

The successful negotiation of joint development arrangements requires a combination of political skill, will, patience, imagination

practical mindedness and some luck. Such negotiations should be inspired by precedents but not constrained by them.³⁶ These sentiments are probably good advice for most forms of Third World cooperation in marine mineral exploration and exploitation.

New Caledonia: decolonisation and denuclearisation in the Pacific

In 1984 the 320 people living in the tiny atoll of Rongelap in the central Pacific Ocean next to the atolls of Bikini and Enewetak, where the United States had tested at least sixty-six nuclear devices between 1946 and 1954, decided that they must leave their island. What they read in the reports of the US Government health services about the irradiation of their soils and their bodies confirmed what they could see around them in their ancestral home. Like the people of Bikini and Enewetak, they decided—thirty years after the last atomic tests—that they must become nuclear nomads.

The people of Rongelap looked for a place to go and a vessel to take them there with as many of their belongings as they could remove. The US government was unhelpful and it was hard to find a vessel large enough for the purpose. Eventually, the Greenpeace organisation of environmental protectionists offered their vessel, *Rainbow Warrior*. The relocation took place in May 1985. From the US Trust Territory of the Marshall Islands the *Rainbow Warrior* sailed south to New Zealand to refit and to protest against French nuclear testing in neighbouring French Polynesia. It was rumoured that the French were about to test a neutron bomb at their Mururoa Atoll testing site, despite long-standing regional complaints from Australia, New Zealand and other South Pacific states against nuclear testing in the Pacific.

On 10 July 1985 two explosions sank the 160-foot *Rainbow Warrior* in Auckland harbour killing one crew-member and missing the executive leadership of the Greenpeace organisation only by chance. Three months of investigation made it impossible for the French Government to deny that it was responsible for an act of state terrorism perpetrated in another sovereign country which was in the middle of a difficult struggle to resist the requirements of its allies that it accept a nuclear-based regional defence.

The author wishes to acknowledge the research assistance of Patricia Alonso and Ingrid A Kircher in the preparation of this paper, but bears sole responsibility for the interpretation of the information.

Even as the French were resorting to terrorist tactics to protect their nuclear testing programme from environmental and political critics, the Americans were facing problems from the communities living on the islands that they consider essential to their nuclear defence programmes.

The Trust Territory of the Pacific Islands was established from the former Japanese-controlled Micronesian islands in 1947 and was designated the only Strategic Trust by the UN in recognition of its vital importance to the defence of the US west coast. After forty years of neglect, characterised even by American administrations as benign and by their critics as malign, this last trusteeship has become an embarrassment to the US. Wishing to escape the charge of neo-colonialism, the US nevertheless does not wish to lose control over this vast Pacific territory, and most particularly it needs to retain its absolute control of the missile testing-base on Kwajalein Atoll. Moreover, with the prospect of a post-Marcos Philippines looming as large on security horizons as the loss of Iran, the US is emphatic that it needs to retain control of the deep harbour capacity of the island of Palau as a potential replacement for the facilities at Subic Bay.

The US solution to this dilemma is to foist on the peoples of Micronesia a spurious form of decolonisation in which they would acquire the trappings of statehood but be as effectively deprived of the substance—control over their foreign affairs and defence and control over their fiscal affairs (which would be dependent on continued appropriations from the US)—as the bantustans of South Africa. The terms of this so-called 'compact of free association' have been placed before the peoples of the four micro-entities of Micronesia over the past five years. One entity, the Northern Marianas, opted for commonwealth status with the US on the lines of Puerto Rico. The other three entities will not have sufficient international personality in legal terms to join the UN if the US is permitted to terminate the trusteeship. Yet termination will relieve the US of having to submit its administration of this buffer zone (which contains the 'single most important missile range we have in the entire world' according to Congressman Stephen Solarz) to the scrutiny of the Security Council, currently consisting of the Soviet Union, France, Britain and the United States.

The great hold-out among the Micronesian communities in refusing to accept 'associated status' with the US on terms including acceptance of the nuclear defence has been Palau. The 8,000 voters of the total

population of 15,000 have repeatedly refused to amend their Constitution's 'nuclear-free' clause to enable the introduction of nuclear substances, weapons or ships in their land, sea or air space. In fact, the people of Palau have voted five times on this issue in various forums, because the US will not recognise their commitment to a nuclear-free territory in the light of what they have seen happen at Bikini, Enewetak and Rongelap. The frustration of both sides, American and Palauan, was reflected in the first political murder in post-war Palau, that of pro-Compact President Haruo Remeliik ten days before the bombing of the *Rainbow Warrior*. The American press has not been as assiduous as the French media in investigating this assassination, but whoever actually fired the four bullets that killed President Remeliik, the end result was very satisfactory to the US with the election of the Palauan in charge of Compact negotiations, Lazarus Salii, as the new President in August 1985.

Meanwhile, at the Kwajalein Missile Base in another Micronesian entity, the Marshall Islands, the traditional landowners who saw their land and lagoon seized for US testing of missiles fired from Vandenberg Air Base in California used Greenpeace-type tactics to organise disruptive 'sail-ins' back to their own atolls in protest against the terms in which they have been dislocated. Even if the Marshall Islands government should accede to 'associated status' there is no prospect of the US relinquishing this strategic base which, like US bases in Cuba¹ and Puerto Rico, constitutes effective seizure by eminent domain in perpetuity.

The US and France, then, find themselves in remarkably similar predicaments in the South Pacific. Having established nuclear weapons-testing programmes there that they consider critical, they now find that the rising tides of Micronesian and Melanesian nationalism are bringing their defence activities in the region into a most unwanted limelight. And this at a time when the major inheritors of the British intrusion into the Pacific of two centuries ago, Australia and New Zealand, are increasingly apprehensive about the price they may be required to pay or what they used to think of as a protective alliance.

¹ In 1903 a site covering 28,000 acres at Guantanamo Bay was leased to the US as a naval station by the Cuban Government; the lease was renewed in 1934. Since 1960 the Castro Government has refused to accept the token \$5,000 annual rent and has pressured for the surrender of the base, but the terms of the lease—as for the Micronesian sites—requires consent of both governments to revoke and is therefore in effect in perpetuity. The fully sovereign government of Cuba cannot dislodge the US military installation which is often called the 'Pearl Harbor of the Atlantic.'

The changing attitudes of Australia and New Zealand to US and French military presence in the South Pacific demonstrates Disraeli's remark that yesterday's extremists are today's moderates. In September 1985 the *New York Times* published an overview of Australia by its managing editor, Seymour Topping. He reported as received wisdom views that five or ten years ago would have been considered views of the far left; namely, that because of its hosting of US satellite surveillance and communications facilities, Australia was rendered vulnerable to Soviet aggression. Yet the irony is that as Prime Minister Robert Hawke is a far more cautious critic of the ANZUS alliance or French nuclear testing than he was in opposition or as leader of the trade union movement. In 1973 Hawke led an ACTU (Australian Council of Trade Unions) boycott of French goods and communications in protest against French nuclear testing in the Pacific. But ten years later Prime Minister Hawke sponsored a nuclear-free zone scheme to the South Pacific Forum² which, while it seeks to outlaw nuclear testing in the region would accept passage of such weapons through the region by air or sea with the necessary port calls.

However, New Zealand's Prime Minister, David Lange, leads a Labour Party strongly opposed to all aspects of the nuclear defence involved in the ANZUS alliance. In a recent article in *Foreign Affairs* (Summer 1985) Lange noted:

New Zealanders have felt an increasing sense of frustration and concern that progress in bringing the nuclear arms race under control had been minimal overall and in recent years nonexistent. This concern has been heightened by the growing realization that, despite its physical isolation, New Zealand would not escape the consequences of a nuclear conflict. Anti-nuclear sentiment has also been fanned by French intransigence in persisting with its nuclear testing program in the South Pacific, in defiance of the expressed views of countries in the region.

That intransigence was reflected by France's repudiation of the World Court decision in the action brought by Australia and New Zealand a decade ago when France held that it was not bound by the statements of mere politicians. The sinking of the *Rainbow Warrior* in

² The South Pacific Forum was formed in 1971 as a regional voice. It held its sixteenth meeting in August 1985 at Rarotonga in the Cook Islands. The Forum consists of the island states of the South Pacific together with Australia and New Zealand. It has vigorously opposed Japanese plans to dump low-level nuclear waste in the Pacific, and at Rarotonga declared the South Pacific a nuclear-free zone. However, Australia effectively protected the desire of the US to retain transit rights for nuclear vessels and substances, which are being opposed by New Zealand and several other states. The South Pacific Forum is united in its opposition to French nuclear testing in the Pacific.

Auckland at the height of New Zealand's dispute with the US over its refusal to accept nuclear vessels can only have hardened the New Zealanders' resolve not to become party to the disputes of the northern hemisphere.

But Australians and New Zealanders are not able to feel complacent about their relationship with their regional neighbours either. When Vanuatu came to independence from both Britain and France, the Hon. Walter Lini told the 'landowning' cultures of Australia and New Zealand that if confrontation is to be avoided with the 'landusing' cultures of the Pacific, future relationships are going to depend 'on a practical acknowledgement that our new-found freedoms were fought for, to a significant degree, in order that a renaissance of Melanesian values, principles and expectations could take place.' (*Australian Outlook*, August 1982, p 29.)

The one issue that cuts through the normal timidity of Papua New Guinea's foreign policies is that of the Melanesian renaissance. The Papua New Guinea delegation has manoeuvred itself into a leadership role in the Decolonisation Committee of the UN in recent years. As the last Trust to be terminated by the Trusteeship Council, Papua New Guinea is assiduous in monitoring the extraordinary procedures of the current Trusteeship Council as Britain, France and the US try to impose virtual bantustan status on the people of Micronesia.

These regional tensions and ambivalences about French and American militarisation of the Pacific are reflected in the dynamics of the South Pacific Forum. Australia, New Zealand, Fiji, Papua New Guinea, Western Samoa, Tonga, the Solomon Islands, Vanuatu, Nauru, Kiribati and Tuvalu, and the dependent territories of Niue and the Cook Islands annually try to agree levels of militarisation that they will accept. Australia has played the role of apologist for the US interest luring the Labour Governments of both Whitlam and Hawke. It is thus at odds with New Zealand which has long been a proponent of full denuclearisation of the Pacific. Fiji has been ambivalent on the issue, banning nuclear-capable vessels in 1982 but subsequently reversing this position under US pressure. Vanuatu is the Young Turk of the Pacific, and has been the main and often the only friend of Melanesian independence movements.

Meeting in Tuvalu in 1984, the South Pacific Forum accepted an Australian proposal that would ban the use, testing or stationing of nuclear explosive devices in the South Pacific but left to each sovereign nation the decision whether or not to permit transit of such weapons and

nuclear-powered vessels within their land, sea and air space. This suits the US which is currently not testing nuclear weapons in the Pacific, although it is testing missile-delivery systems at Kwajalein. It does not suit the French who have their nuclear weapons testing installation on Mururoa in French Polynesia. But French and American territories are in any case excised from the Australian-proposed Zone. This essentially gutless South Pacific Nuclear-Free Zone was endorsed as a treaty by the 1985 South Pacific Forum at Rarotonga in the Cook Islands. As well as being a victory for the Americans and French on the denuclearisation issue, the Forum also comforted the French by refusing to accept French Polynesia's request for observer status. The Forum also accepted French promises to hold an Act of Self-Determination in New Caledonia by the end of 1987 at face value, decided not to embark on a campaign to have New Caledonia 'reinscribed' in the list of territories under the authority of the UN Special Committee on Decolonisation at the Fortieth General Assembly.

Australia, with the help of New Zealand (whose Prime Minister Lange is far less sympathetic to Kanak demands for independence than he is to the call for a nuclear-free Pacific) succeeded in blocking, for 1985 at least, efforts by Vanuatu and Papua New Guinea to mount the major diplomatic campaign that is essential if the Kanak people are to be given a true opportunity to determine their future before the end of this decade. It is within this context that we must evaluate the prospects for Kanak nationalism in New Caledonia. The Socialist Party leader and a former Minister for Overseas Territories, Francois Mitterrand, told the French Parliament on 23 November 1979:

We have had enough experience, over the last quarter of a century, of the problems of decolonisation to know how desperate, and then how angry, peoples can become when they do not know where to turn, or when, knowing where to turn—in other words to the French government—they find neither interest, nor vigilance, nor consideration, nor understanding. We are now approaching a situation of desperation which, mark my words, will lead to confrontation.

Now, no doubt you will tell me that the Kanaka population in New Caledonia is, ethnically speaking, in the minority. That may be so, but such arguments are not valid when one remembers how immigration from both metropolitan France and from neighbouring countries has been encouraged. What has to be taken into account is that all the Pacific countries, including Australia, have, after being consulted by the *Front Indépendantiste*, backed their claim to independence. We are going to face a situation that would well, I feel, become extremely tense and possibly dangerous. To what degree should

the claims of the *Front Indépendantiste* be met? I leave that for you to judge. The claims of the Socialist Party have already made up our minds.

The Kanakas, who in 1979 constituted only 42 per cent of the population of this cigar-shaped island that has been part of the French domain in the Pacific since 1853, did mark Mr Mitterrand's words. In May 1981 they supported him in the Presidential elections that brought the Socialist Party to power in France, while the European constituencies in New Caledonia voted overwhelmingly for Giscard d'Estaing. Five years later, however, it is very clear to both Frenchmen and Kanaks that the Socialist Party has not in fact made up its mind about whether the call for independence in New Caledonia can or could be met.

The French are not eager to divest themselves of their empire in the Pacific—the five archipelagos of French Polynesia, the Wallis and Futuna Islands, and New Caledonia, 750 miles east of Australia—at a time when the Pacific Basin is viewed as having some of the strongest economies in the world. While the mineral wealth of New Caledonia—nickel, chrome, iron, manganese and cobalt—is subject to market fluctuations, the 200-mile Exclusive Economic Zone of New Caledonia waters is yet untapped.

Strategically, New Caledonia is an important potential backstop for the *Centre d'Expérimentation du Pacifique* on Mururoa Atoll in French Polynesia. All post-war French governments have been committed to independent nuclear capability for France, *une force de frappe*, the latest strain in Franco-American relations. In 1960 the Algerian crisis forced the French nuclear-testing programme to move from the Sahara to the Pacific. France exploded forty-one nuclear bombs into the Pacific atmosphere between 1966 and 1975, when protests from neighbouring Japan, Australia and New Zealand forced the programmes to move to underwater testing at Mururoa Atoll, despite its highly porous and brittle coral and basalt composition. At least forty-four bombs have been detonated under the atoll, including, according to President Mitterrand in 1980, prototypes of a neutron bomb. Although the advent of Socialist government in Paris in May 1981 led to trade union protests among the more than 3,000 technicians on Mururoa about safety (there were two major accidents in July 1979, and hurricanes were alleged to have washed nuclear wastes off the atoll in 1981) the Mitterrand government has shown no inclination to curtail the French nuclear development programme.

The French maintain an estimated 3,000 troops in French Polynesia

nuclear-powered vessels within their land, sea and air space. This suits the US which is currently not testing nuclear weapons in the Pacific, although it is testing missile-delivery systems at Kwajalein. It does not suit the French who have their nuclear weapons testing installation on Muroroa in French Polynesia. While the mineral wealth of New Caledonia—its nickel, chrome, iron, manganese and cobalt—is subject to market fluctuations, the 200-mile Exclusive Economic Zone of New Caledonia waters is yet untapped.

Strategically, New Caledonia is an important potential backstop for the *Centre d'Expérimentation du Pacifique* on Mururoa Atoll in French Polynesia. All post-war French governments have been committed to an independent nuclear capability for France, *une force de frappe*, the greatest strain in Franco-American relations. In 1960 the Algerian crisis forced the French nuclear-testing programme to move from the Sahara to the Pacific. France exploded forty-one nuclear bombs into the Pacific atmosphere between 1966 and 1975, when protests from neighbouring Fiji, Australia and New Zealand forced the programmes to move to underwater testing at Mururoa Atoll, despite its highly porous and brittle coral and basalt composition. At least forty-four bombs have been detonated under the atoll, including, according to President Giscard in 1980, prototypes of a neutron bomb. Although the advent of a Socialist government in Paris in May 1981 led to trade union protests among the more than 3,000 technicians on Mururoa about safety (there were two major accidents in July 1979, and hurricanes were alleged to have washed nuclear wastes off the atoll in 1981) the Mitterrand Government has shown no inclination to curtail the French nuclear development programme.

The French maintain an estimated 3,000 troops in French Polynesia

and a full complement of marines, paratroopers, naval and air forces 2,500 miles away at New Caledonia. The two garrisons are mutually reinforcing, and stand ready to be rapidly deployed to any flashpoint in French territories or those of France's allies in the Pacific. New Caledonia was a very important base for the US and Allied forces during World War II.

As well as its strategic interests, the French government wishes to protect those of its antipodean citizens. In his Brazzaville speech of 1944, de Gaulle had envisioned a community of French territories based on free contractual association. Immediately after the war the terms of this contract were specified in the French Union of 1946. Some colonies became overseas provinces, others overseas territories or associated territories. All indigenous inhabitants of overseas lands associated with France were granted French citizenship. The Socialist government of 1955 enacted the *loi cadre* ten years later in which the overseas territories were given an opportunity to opt for independence or continued contractual association with France. Only Guinea opted for independence in the 1956 referendum. New Caledonia became an Overseas Territory. Because of the 1956 act of choice, France was able to argue in the nascent UN Committee on Decolonisation that its remaining dependencies had willingly chosen a contractual association with the metropole, and therefore ought not to be inscribed on the list of territories that were not yet self-governing or decolonised. The Kanak call for independence challenges the French argument that it is not a colonial power.

A hundred years ago there were 10,000 French convicts in New Caledonia under the control of 5,000 of their fellow Frenchmen. Before the Europeans arrived, it is estimated that the Kanak population numbered between 50,000 and 70,000. In 1982, the Kanak population was 64,300 or 44.6 per cent of the population of 144,000. The first official French count of the Kanak population in 1887 estimated their numbers at 42,500. Twenty-four years later, in 1911, there were only 28,800 Kanaks. Disease, alcohol and missionary-advocated monogamy had combined to reduce the indigenous population by one-third in the first half-century of European presence.

The size of the Kanak population remained stable—without growth but without marked decrease either—until World War II. New Caledonia's 15,000 Frenchmen overwhelmingly supported de Gaulle, and New Caledonia was a very important Allied base during the Pacific war. The Kanaks were 54 per cent of the population at the outbreak of

the war, Europeans 29 per cent and people from other islands such as Wallis and Futuna, west of Samoa and north of Fiji, amounted to 17 per cent. Since both the European and Kanak populations had remained stable at approximately 15,000 and 29,000 respectively, all the growth in New Caledonia's population was in these immigrant groups from other Pacific islands who had come to the *Grande Terre* looking for work. These immigrant workers have always identified their interests with those of the Europeans who owned the enterprises—particularly the nickel-mining and grazing lands—in which they came to work.

The arrival of the American forces during World War II precipitated a boom in construction and services. As a result, the 1956 Census reported a 40 per cent increase in the European population to 25,160 while the Kanak population increased by only 33 per cent to 41,190. There had been considerable emigration of the other islanders during the war years, so that Kanaks were 51 per cent of the population in 1956 and Europeans 36 per cent. This was the last time that the Kanaks were a majority in their own land.

The *Institut National de la Statistique et des Etudes Economiques* (Paris) reported that 80 per cent of the 25,160 Europeans in New Caledonia in 1956 had been born there, but more than one-third of these locally born Europeans (*Caldoches*) were under fifteen years old. That is to say that of the 20,128 *Caldoches* in New Caledonia thirty years ago, one third were children in 1956. Broadly speaking, the number of Europeans of voting age in 1985 who were born in New Caledonia is probably about 30,000.

But the European population in New Caledonia rose steadily during those intervening thirty years. In the 1960s the European population increased by 5,000 more than the natural increase of the Kanak population. The rate of growth of the European population in the 1960s was exactly twice that of the Kanaks. But the number of immigrants from other islands also redressed the losses of the war years, so that by the end of the 1960s the Kanaks constituted only 45 per cent of the population of their own land; Europeans had broken the 40 per cent level, and people from other islands were 14 per cent of the population of New Caledonia.

The population of New Caledonia on 23 April 1974 was 131,655, an increase of nearly 31 per cent since March, 1969. The *Institut National de la Statistique et des Etudes Economiques* noted in its official report of the 1974 Census that:

This remarkable increase is explained partly by the natural rate of increase in

the Territory, but essentially by immigration which has attained a spectacular level in the years 1970-74 in the wake of the development of mining production and economic development.

This was despite a crisis in the nickel market which led to net emigration in 1973. The Institute further noted:

The consequences of this immigration during the period 1969-1972 on the distribution of the population by ethnic origin appeared clearly. It is evident in a perceptible diminution in the *preponderance of the Melanesians* who represent only 40.8 per cent of the total population, despite an effective total of nearly 54,000 people; a marked increase in Europeans (39.2 per cent) and other ethnicities (20 per cent).

The Institute also noted the dramatic increase in the population of Noumea, the capital city, which passed 59,000 and was 44.8 per cent of the population in 1974, a 41 per cent increase since 1969. The Institute attributed this growth in Noumea to a number of causes:

The settlement in the capital of more than 95 per cent of the immigrant arriving in the territory in the period 1969-74; the attraction, growing stronger and stronger, of Noumea for Melanesians looking for salaried work in particular those coming from the Loyalty Islands; and the maintenance of high birth-rate.

The concentration of the population around the capital city was reflected in the 86 per cent increase in the populations of Noumea's three neighbouring satellite communes, Mont Dore, Dumbéa and Païta. More than half of New Caledonia's population lived in these four districts by 1974.

The European population actually decreased by 825 before the next count in 1976 but the number of people who were neither Kanak nor European had almost doubled since 1969 to 26,878. By 1976 the population was approximately 40 per cent Kanak; 40 per cent European and 20 per cent other islanders. The Institute reported that of the 50,000 Europeans, 30,500 had been born in New Caledonia, 14,500 in metropolitan France, and 2,300 in Africa of whom about 1,000 were from Algeria, and there were another 1,000 Europeans from countries other than France, particularly Italy. The Institute pointed out in its 1976 report that:

Immigration has constituted an important demographic factor since a quarter of the people counted in New Caledonia were not born there. This immigration has been especially important from 1969 to 1976. The flows of the previous six years have been very important. They have been composed on the one part by the massive arrival of workers attracted by the development activity in the

territory and on the other by the groups of civil servants and military people who stay for 2, 3 or 6 years in the Territory. The figures for 1975 and 1976 are particularly swelled by the 1200 soldiers come to do their national service in New Caledonia. The record years remain 1970 and 1971 when nearly 7000 people emigrated to the Territory. The professions most frequent among the immigrants are business and the military.

The Institute indicated that 70 per cent of the 20,527 Europeans born outside the Territory had arrived in 1969 or later; 60 per cent of the external-born population of all ethnic groups arrived since 1969. Only 7 per cent of the external-born inhabitants of New Caledonia in 1976 had arrived in the territory prior to 1950.

By 1982 the total population of New Caledonia was 144,000. The Kanaks were 45 per cent of the total, having increased by 13,543 people. The total other population had actually decreased by 10,767 but the Kanaks were a minority in their own land. The nickel industry—owned by metropolitan French interests—was in a severe recession. Paris was making up nearly 30 per cent of receipts for the Territory's budget by 1984 largely as a subsidy during the nickel slump and to support a major programme of primary education for the Kanak people. The central government was infusing more than twice the locally generated revenues, and its total commitment, including military, to the economy was estimated at US\$250 million annually.

A hundred years ago, in 1878, the Kanaks had revolted against the French Governor's seizure of their lands. Two thousand Kanaks and 200 Frenchmen died in that revolt. It was not until 1946 that the Statute on Native Peoples was lifted and the Kanaks were no longer used as forced labour, and acquired the right to move outside the reservations without government permission. New Caledonia gained the right to elect representatives to the French Parliament, and one thousand Kanaks became eligible to vote because of their service in the French Armed Forces. In 1958 New Caledonia voted to become an Overseas Territory by accepting the Constitution of the Fifth Republic in the first election conducted on the basis of universal suffrage.

Executive power was vested in the High Commissioner appointed from Paris. The 36-member Territorial Assembly was permitted to debate and approve the budget submitted by the administration, and to 'express its desires' on issues beyond that narrow jurisdiction. The High Commissioner presided over weekly meetings of the Governing Council, whose seven members were elected by the Territorial Assembly.

But by 1979 neighbouring New Hebrides was moving uneasily to independence from both Britain and France. President Giscard d'Estaing tried to pre-empt the growing autonomy demands in New Caledonia with 'A Long Term Plan for New Caledonia's Economic and Social Development' which came to be known after its advocate, the Secretary of State for Overseas Departments and Territories, Paul Dijoud. The Dijoud Plan committed France to US\$1500 million in development funds over the next decade; more importantly, it began the process of land reform. However, since the legislature was dominated by white settler interests opposed to these reforms for the Kanak people, Dijoud found that the only way he could proceed was by suspending the legislature and operating under Executive Order.

Dijoud insisted that only those parties receiving at least 10 per cent of the vote should be represented in the New Assembly. This precipitated the formation of three coalitions: the *Rassemblement pour la Caledonie dans la République* (RPCR), which, as its name suggests, was anti-independence; the *Fédération pour une Nouvelle Société Caledonienne* (FNSC); and the *Front Indépendantiste* (FI). The first two coalitions entered an alliance, with twenty-two seats in the new Assembly. The FI had only fourteen seats, but it had attracted 82 per cent of the Kanak vote. President Giscard visited New Caledonia in September 1979 and told the FI that it would have to win independence at the ballot box. He advised the white settlers to give the Kanaks a more equitable place in New Caledonian society by beginning with land reform.

In May 1981 François Mitterrand won the presidential election. Despite the absence of a Socialist Party in New Caledonia, he was soundly supported by the Kanak vote, just as the white settlers voted against him overwhelmingly. The new President sent his Minister for Overseas Territories, Henri Emmanuelli, to New Caledonia in August and he recommended acceleration of land reforms and other changes. But, like Dijoud before him, he found that he had to institute rule by decree to get anywhere in this process. In the charged atmosphere of late 1981 a European supporter of independence, Pierre Declercq, was assassinated. He was the first European to be buried in Kanak traditional burial grounds.

In March 1983 the *Front Indépendantiste* won control of eighteen of the thirty-two communes outside Noumea, while the RPCR took all forty-five of the commune seats in the capital. Noumea, the most industrialised city in the South Pacific, the *entrepôt* of the second most

important nickel deposits outside the communist world, was now clearly declaring itself an enclave of white workers, civil servants and tourists. In June 1983 the centrist FNSC withdrew from its coalition with the RPCR and entered into a new alliance with the *Front Indépendantiste*.

A year later President Mitterrand summoned two dozen New Caledonian leaders of all parties to Nainville-les-Roches for round-table discussions. There the French government recognised the right of the Kanak peoples to self-determination, including their right to sovereignty. The Minister for Overseas Territories, George Lemoine, proposed a Statute of Autonomy as a five-year transitional device to an act of self-determination in 1989. The Lemoine Statute was submitted to the French Senate in May 1984. The depth of indifference of the French Parliament to the fate of New Caledonia was indicated by the fact that only seventeen of 488 deputies were present at the vote. The Lemoine Statute passed into French law by seven votes in favour, six against and three abstentions.

The Lemoine Statute was as hotly contested in New Caledonia as it was ignored in metropolitan France. The white settlers said that it gave away too much; the Kanaks feared it was just a trick for postponing the problem to a post-Mitterrand government in 1988. The Statute attempted to promote the internal self-government that most dependent territories have today, but retained control for France of defence, the judicial system, foreign relations and—significantly—immigration. The *Front Indépendantiste* transformed itself into the Kanaka National Socialist Liberation Front (FLNKS) and announced that it would boycott the Territorial Assembly elections scheduled for 18 November 1984 that would serve as a referendum on the Statute. The FLNKS announced that it would form a Provisional Government on 1 December.

The Kanak boycott of the November elections was dramatically successful, even though President Mitterrand had responded by sending in 280 riot police. At the same time as the FLNKS formed its Provisional Government, President Mitterrand sent his Special Envoy, Edgard Pisani, to meet all the parties in order to submit a proposal for resolution of the impasse within two months.

Himself a former Minister for Overseas Territories during the early 1950s, President Mitterrand now accepted the failure of the Lemoine proposals and asked Pisani (former Gaullist Minister of Agriculture, member of the European Parliament and of the Brandt North-South Commission who had become a member of the Socialist Party in 1974)

to carry out the 'mission impossible' that would require the wisdom of Solomon. The Special Envoy worked remarkably quickly and on 7 January he announced his proposals to the people of New Caledonia over Noumean television:

France or independence.

Independence or France.

It is possible to combine that which has thus far been in opposition. I suggest that you decide, in the framework of Article 88 of the French Constitution, in favour of independence with association, guaranteeing the two countries stability in their relations and guaranteeing all, physical and moral persons, respect for their legitimate rights and security.

France and independence.

Mr Pisani insisted that there could be no lasting, peaceful or useful French presence in the Pacific without everyone's consent. But he also remarked that 'the last forty years in the life of this world teach us that once the claim for sovereignty is expressed by a genuine people, independence is inevitable.'

Mr Pisani proposed a referendum in July 1985 on the constitution of New Caledonia as an independent state associated with France. All citizens who had lived in the territory for three years would be permitted to vote on its future. If the proposal succeeded, the French Parliament would recognise New Caledonia's independence as of 1 January 1986. In the interim, the territory would be governed by a transitional government under the High Commissioner until a legislative assembly was elected that could negotiate the necessary treaty with France and the 'community pact designed to serve as the basis and ground rules of the multiracial society that Caledonian society will remain.' Residents would be offered New Caledonian or French citizenship, but no-one would be forced to leave the territory if he or she did not opt for New Caledonian citizenship. Noumea would be given 'special status'. New Caledonia would have sufficient international personality to become a member of the UN and of such regional associations as the South Pacific Forum. Pisani proposed generous economic support for the territory, and argued energetically for diversification of the economy since 'it is ridiculous that agriculture should account for only 3 per cent of New Caledonia's national product'. He sought, he said, not to strike a blow at the economy of Noumea, but rather to give it 'a solid base, a hinterland that can become its supplier and its client'.

The Pisani Plan was criticised in Paris and Noumea as a sellout, while the Kanaks argued that the enfranchisement of all who had been in the

territory for only three years would ensure the supremacy of white settler interests. Mr Pisani worked hard to explain his compromise to all the interested parties. 'I had to work out a "mix" of guarantees: guarantees to France, to the Kanak people, and to the other communities. Then I realised that the problem was not that of the French presence in New Caledonia but the terms of that presence . . . We have all the elements to arrive at a durable contract that will promote equilibrium.' Mr Pisani is convinced that 'It is the future of New Caledonia to remain a multi-racial society.'

While Parisian forces called for the impeachment of President Mitterrand, the Gaullist leader of Noumea, Jacques Lafleur, flatly rejected the Pisani Plan. The debate within the FLNKS over how far to accommodate Mr Pisani was polarised by the killing of the Minister of Internal Security, Eloi Machoro, on 12 January. Machoro's faction had travelled to Libya and was the most militant of the barricade builders in the countryside outside Noumea. Mr Mitterrand was in the process of extracting his troops from Chad, and now found himself having to send 3,000 of them out to New Caledonia to protect the white settlers against Machoro's Libyan-trained platoon. Jean-Marie Tjibaou, the President of the Provisional Government, initially accused Pisani of acquiescing in the killing of Machoro in order to eliminate this militant faction. But President Mitterrand flew to New Caledonia for twelve hours of meetings with both sides on 18 January to 'reopen the dialogue'. His visit also constituted an endorsement of the Pisani Plan. Pisani told Stephen Downes of *The Age* (Melbourne) on 23 January:

'President Mitterrand has emphasised my general architecture and he has asked everybody to contribute to the shaping round this architecture of the flesh . . . I think the bones are fixed'.

But President Mitterrand and Mr Pisani found that many observers consider that it is not only their metaphors that are mixed. '*L'indépendance avec La France*' seems a contradiction in terms to people more familiar with British principles of decolonisation. The editorial writers of *The Times* (London) passed the following judgement on January 8:

An ingenious proposal, but one which apparently defies a primary rule of logic: the law of the excluded middle. A state, one would think, is either independent or not. The presence of foreign forces is not the litmus test, but their use when it comes to internal security surely is. Are they to take orders from the independent government? If so, how can France guarantee the position of the settlers after independence? If not, how can the state be called sovereign?

The Times thought the proposals for a subsidiary special status within a special status for Noumea 'bizarre'. All in all, the proposals reminded the British too much of Cyprus or the communalism of Ulster.

Shortly after Mr Pisani returned to Paris at the beginning of April the journal *Valeurs Actuelles* leaked a French Defence Department study calling for a large naval base at Noumea to accommodate nuclear submarines, the enlargement of the airfield at Tontouta and the stationing of several thousand military personnel in what observers saw as 'a giant aircraft carrier of 19,000 square kilometres' situated on the junction of the major sea lanes in the South Pacific. Four thousand *Caldoches*, calling themselves 'Friends of the US', staged a rally in Noumea calling for US intervention to make New Caledonia its fifty-first state. At the end of April, Prime Minister Fabius presented a revised plan for New Caledonia which proposed a referendum on self-determination by the end of 1987 and in the meantime the creation of four Regional Councils to be elected in August 1985 which in turn would elect a Congress to replace the Territorial Assembly which would serve on an interim basis until the 1987 referendum. The plan also made gestures towards economic, social and cultural advancement for the Kanaks, but at the same time envisaged the reinforcement of the French military presence.

There was a riot at Noumea when French nuclear submarines visited at the beginning of May 1985, and feelings were not soothed either in New Caledonia or the region when the Defence Minister, Charles Hernu, visited and said emphatically 'The retreat of French soldiers from New Caledonia is non-negotiable. France is there for another 20, 30 or 100 years.' Meanwhile the revised proposals ran into trouble in Paris where the French National Assembly modified the powers of the Regional Council and created Councils of Chiefs in the regions. The FLNKS held its congress at the end of April to decide whether or not to boycott the August elections. The moderates prevailed and it was decided to use the 'regionalisation' proposals as a means towards independence.

On the eve of the tenth anniversary of French underground tests in the Pacific, France exploded its seventieth nuclear device at Mururoa despite continuing objections led by New Zealand. The French Senate sent a delegation to New Caledonia in July and later in the month the Senate referred the New Caledonia legislation to the Constitutional Council on the grounds that the electoral rearrangements in favour of the constituencies outside Noumea created imbalances. Pisani was

replaced by Fernand Wibaux, former French ambassador to Lebanon, as the *Rainbow Warrior* was blown up in Auckland harbour.

Soon after the South Pacific Forum met in Raratonga and failed to strongly endorse the campaign to have New Caledonia reinscribed on the UN's list of colonial territories, the French Constitutional Council declared the New Caledonia Bill unconstitutional because it would disadvantage the white settlers. Anthropologist Jean Guiart claimed that the *Caldoches* electoral roll was inflated while young Kanaks in particular had not been registered on their rolls. The French Right had every interest in prolonging the situation to prevent a resolution before the March 1986 National Assembly elections, but Mitterrand called an emergency session of the National Assembly in late August and the Bill was passed. The referendum was set for 28 September. The French role in the sinking of the *Rainbow Warrior* was becoming more apparent every week, but while Defence Minister Hernu eventually had to resign, the government survived and very few observers clearly understood the connection between the Greenpeace campaign and the decolonisation struggles in the French and American nuclear testing sites in the Pacific.

Voter turnout on 28 September was estimated as between 80 and 90 per cent. The settler party RPCR won twenty-five of the forty-six seats but only one of the four regional councils, Noumea. The FLNKS won not only the two regions they were expected to take, but also, the third, the central region or satellite region around Noumea. The Kanaks thus won control of the local level councils, but the RPCR settler interests hold a majority in the interim Congress.

Some observers saw the French strategy as one to 'gradually increase autonomy before a referendum on independence is held by the end of 1987' (*Sydney Morning Herald*). Others thought the FLNKS has locked themselves into agreeing to the enfranchisement of recent arrivals on the island that would trap them if the act of self-determination is ever held. Most saw it as a delaying tactic on the part of the French and wondered if the Kanaks had agreed to it because the loss of their military wing with the death of Machoro had taken away their will to fight other than at the ballot box. Few saw it as an enduring solution. The RPCR's Lafleur called it a 'completely mad' gerrymander. Prime Minister Lange, champion of Pacific denuclearisation but not necessarily decolonisation, said hopes for a middle ground were dashed by the election results. What nobody could deny was that the FLNKS held at least eighty per cent of the support of the Kanak people of New

Caledonia. The question for them to decide before the end of 1987 is how far they want to go with that mandate.

Whoever wins the March 1986 elections in France will not be able to just wish the New Caledonia problem away. As a moderate opposition leader told Ingrid A Kircher in April 1985: 'The [French] opposition is making politics using the New Caledonia issue as a trampoline. But if they have the New Caledonia problem on their hands when they come to power, it will not be easy for them.'

The troubled course of Colombian peacemaking

The Colombian M-19 movement assaulted the Palace of Justice in the centre of Bogotá on 6 November 1985. After little more than a day the affair was over, at great cost in human life—the M-19 guerrillas themselves, their hostages (including a good proportion of the judges of the Supreme Court), guards, police, army. A week later the Nevado del Ruiz volcano erupted, causing a mud-slide that buried the town of Armero and killed some 25,000 people. The Armero disaster thrust into the background the events of the Palace of Justice. Those events themselves had been so swift that the outside world had had little chance to ponder what might be behind them. The M-19 had miscalculated—it had clearly expected to reap a rich harvest of publicity in the course of prolonged negotiations, as it had for eight weeks in 1980 by holding captive a number of ambassadors in the residence of the Dominican Embassy. Thus, at the end of a disastrous month the situation in Colombia had by no means been made clearer. Situations elsewhere in Latin America where guerrillas are active—Peru, El Salvador, Nicaragua—are by no means clear either, but they are less obviously perplexing than the affairs of Colombia.

Colombia combines high levels of civil liberty and democratic practice—a free and varied press, freedom of association and organisation, independent trade unions, frequent and regular elections (the most consistent record in Latin America), a party system in which there is much competition and in which careers are certainly open to talent—with persistent political violence and the longest guerrilla history in the hemisphere. President Belisario Betancur, who took office in August 1982, has undoubtedly (many polls are taken in Colombia) been the country's most popular President for many years, and his presidency has been characterised above all by his drive for an internal peace settlement. Why then did November produce scenes of such spectacular violence? How did three years of negotiation, truce and dialogue end in such bloody misunderstanding and miscalculation? The pessimists in Colombia now declare that, logically, the republic will now go the way of 'either El Salvador or Argentina'. But republics are not works of logic, and Colombia is not like either El Salvador or

Argentina in social structure or in institutions. If there is much reason for pessimism, then which pessimists are right? Some general knowledge of the republic's past history is needed to begin to answer these questions, and to set the current actors—the government and the civilian politicians, the army, the revolutionaries, the civil population (urban and rural), outside influences, drug-traffickers and other criminals—in context.

The Historical Background

Colombia has a long history of political violence. In the nineteenth century this took the form of frequent civil wars between Liberals and Conservatives, which left a complex pattern of sectarian antagonism and mistrust throughout the country. The parties were loose coalitions of regional groups, not defined by any class lines, but conflict had the effect of spreading allegiances far and wide, if only for defensive purposes, and most Colombians and most districts came to have little doubt on which side their loyalties lay. In the early years of this century conflict was muted by arrangements for minority representation, but it revived after 1946 in acute form, intensified by wider popular participation. Strife between the parties produced a short-lived military government between 1953 and 1957 under General Gustavo Rojas Pinilla—the first army government for a hundred years. The number of dead between 1946 and 1957 cannot be precisely calculated, but ran into tens of thousands. Numerous guerrilla bands came into existence, predominantly Liberal in political colour; the best organised, those of the *llanos orientales* or eastern plains, numbered several thousand. In 1957 the leaders of the two traditional political currents agreed on a 50-50 power-sharing coalition, the *Frente Nacional*, to oust the army and to bring an end to *la violencia*. Some Liberal guerrillas had already accepted an amnesty offered by Rojas Pinilla in 1953. Others now accepted a new amnesty. Others did not: some became bandits, and most of these were killed in the 1960s; some remained without amnesty under revolutionary colours—the Colombian Communist Party had established here and there a rural presence in earlier decades—and the majority of these went on to form what in the early 1960s emerged as the *Fuerzas Armadas de la Revolución Colombiana*, the FARC. The early 1960s also saw the emergence of the Castroite ELN and the Maoist EPL. In choosing their areas of operation these groups studied what had gone before. The origins of the M-19 were different. That group

emerged as a response to the elections of 1970, when divisions in the Conservative party and Liberal indifference to the Conservative candidate of the *Frente Nacional* led to a surge of support for the opposition led by General Rojas Pinilla—like Perón, though to a much lesser degree, the General enjoyed the advantage of being officially proscribed. The *Frente Nacional* won only on a narrow and dubious margin, and the M-19 was formed to undertake an extra-legal response to those it alleged had themselves defrauded the popular vote.¹

That is the barest outline of events up to the beginning of the 1970s, but it helps to explain some characteristics of the present Colombian scene. First, the persistence of politically motivated violence—Liberal, Conservative, revolutionary or reactionary—combined with a high level of violent crime, blunts the sensibilities. Guerrillas have a far greater impact, at least initially, in places previously at peace. There have been so many guerrillas intermittently operating in different parts of Colombia that it is only extreme actions that produce any *frisson*. It is perhaps partly that consideration that governs the decisions of the M-19, but it also explains the lack of success that the 'small motor' of the guerrilla—to fall back on the *foco*-theory terms of the 1960s—has had in starting up any 'large motor' that might be better geared towards changing the Colombian political system.

Secondly, though there have been vast changes in Colombian society in these decades—one need only mention the extraordinarily rapid rate of urbanisation and secularisation—the guerrilla situation has remained relatively static. No one knows exactly how many guerrillas there are in Colombia, and the best-informed guesses depend on more-or-less arbitrary definitions of what constitutes a combatant, but there may

¹ A useful compendium of recent Colombian history is A. Alape, *La Paz, La Violencia. Testigos de Excepcion*, Bogotá: Planeta, 1985.

There is a large literature on the complex phenomena of the *violencia*; four useful introductions are P. Oquist, *Violence, Conflict and Politics in Colombia*, New York: Academic Press, 1980; R. W. Ramsey, 'Critical bibliography on la violencia in Colombia', *Latin American Research Review* 8(1) Spring 1973; J. Henderson, *Cuando se Devangro Colombia*, Bogotá: El Ancora, 1983; G. Sánchez and D. Merritts, *Bandoleros, Gamonales y campesinos*, Bogotá: El Ancora, 1984 (introduction by E. J. Hobsbawm).

A superb analysis of the origins and development of violence in a single region is C. M. Ortiz S., *Estado y Subversión en Colombia—La Violencia en el Quindío en los años 50*, Bogotá: CEREC-CIDR Universidad de los Andes, 1985. Explaining the *violencia* requires that sort of patient analysis of the history and society that produced it. A simple enumeration of, for example, social inequalities in the countryside does not explain Colombian violence at all, many regions of Latin America share such inequalities with Colombia but are nowhere near so violent. Current guerrilla activity also requires detailed sociological and historical analysis for its explanation. This short article can only offer some hints.

well be less than ten thousand in all groups, including the M-19 which does not fall within the usual definitions of either 'guerrilla' or 'terrorist'. For what such a calculation is worth, there may have been more guerrillas per capita in the 1950s. Colombia is the fourth largest Latin American republic in area, and has a population of 27 million.

Thirdly, there is a long tradition of both civilian dominance in politics and of negotiation with guerrillas. The influence of the armed forces is not negligible, and it has had its high points as well as its low points since the brief military government of the mid 1950s, but the theorists of creeping militarisation, though they are numerous on the Colombian left, are faced with much that they cannot explain—most obviously the election and policies of President Betancur. In the matter of negotiation with opponents in arms, one jurist has counted sixty-seven *indultos* and *amnistías* (pardons and amnesties) in the hundred and sixty years after 1821.

Some general considerations about public order should be added. Given the size of the republic, the wildness of much of the terrain, the existence of many frontiers with the conflicts frontiers imply, the far from deferential culture of much of the population, the easy availability of arms and the history of civil war and sectarian strife, Colombia has always been a lightly policed and a lightly garrisoned country. The police enjoy neither popularity nor prestige. Since the Bogotá riot of 9 April 1948, when in the chaos that followed the assassination of the Liberal leader Jorge Eliécer Gaitán the largely Liberal police went over to the rioters, they have been under the control of the Ministry of Defence. They have yet to find the right balance between national and local control, and they are ill-paid and ill-equipped. Reforms have been seriously begun, but will take some years to overcome public apathy and hostility—Colombians are far more ready to admit that subversion and crime are not just a problem of policing than they are to recognise that proper policing is an essential part of any solution. The police have suffered particularly heavily at the hands of the M-19 this past year, as their small detachments are an easy target.

The armed forces of Colombia have more extensive counter-insurgency experience than any other Latin American army with the possible exception of Guatemala. Numbers were small up until the 1950s—a few hundred officers and less than ten thousand men—and a professional military career carried little social prestige (the renowned generals of the civil wars had been essentially civilian amateurs). The size of the establishment has since increased to 72,500, and professional

capacity has improved.² The army now recruits *bachileres*, the qualified sons of better-off Colombians, as well as peasants, a significant and necessary advance. It has begun to remedy its greatest weakness, reliance on one-year recruits and lack of highly-trained long service soldiers in the ranks.

The army has had considerable practice in supporting the civil authorities in the control of urban disturbances, and usually handles these well. It is obviously capable of containing the stolid rural guerrillas of the FARC, and there is plenty of evidence to show that its most lucid minds do not consider that purely military solutions to these problems are likely to succeed. There are two marked traits visible in Colombian military ideology. One is anti-communism—they consider that Colombia is already to some extent involved in the East–West conflict, and that communism is an un-Colombian ideology; the second is an insistence on the role of the armed forces as upholders of the Constitution. ‘National Security’ doctrines can be found in Colombian military writings, but so can criticism of them. Increased military powers under a state-of-siege and the use of military courts for cases of subversion have commonly been given as examples of military encroachment on the civilian sphere. It is however civilians who impose the state-of-siege and who decide on the use of military courts; the latter are not universally popular among army officers.

Colombian civil government enjoys a high but not perfect degree of legitimacy. Elections are free and competitive, but the showing of the left is generally poor. Though they are far from monolithic—indeed, because they are not monolithic—the traditional parties dominate the polls, and critics ascribe this to an all-pervasive ‘clientelism’, the catch-all explanation of recent years, and to their superior access to the *maquinaria*, the machinery of government patronage. This is by no means a complete explanation—both traditional parties possess, apart from patronage, some extremely effective politicians—but it is widely believed. Abstention in elections is also high. The voting age is eighteen, the vote is not obligatory and Colombian parties are not rich.

² Total Armed Forces 72,500; Army 57,000. Figures from A J English, *Armed Forces in Latin America*, London: Jane’s 1984. For the role of the army up to the early 1970s see R Maullin, *Soldiers, Guerrillas and Politics in Colombia*, Lexington, Massachusetts: D C Heath, 1973. General (retd) J J Matallana, *Alternativa del 84. Paz o Guerra*, Bogota: Canal Ramirez-Antares, 1984, is an incisive essay by a distinguished soldier.

In a recent survey by the Colombian subsidiary of Gallup into citizens’ confidence or lack of it in national institutions the Army ranked third highest after educational establishments and the Church. See *Semana*, 16 December 1985.

The result is that half or more of this theoretical electorate does not vote. Under a sophisticated analysis the Colombian participation figures do not look so exceptional, but not all analysis, either revolutionary or academic, is sophisticated.³ Few Colombian politicians do not dream of making the break-through that will mobilise these reluctant potential voters, generally located in the new population of the cities. A proportion of this larger urban population consists of a much expanded middle class, which has been little studied, but which is not the same as the much smaller and more dependent middle class of forty, thirty or even twenty years ago.

The conjuncture of 1982

Julio Cesar Turbay Ayala, the candidate of the Liberal party, was elected President in 1978. A man of comparatively humble origins, he was perhaps the first Colombian politician of less privileged background to reach the presidency through his own political strength. He was a single-minded machine politician, and his chief appeal was to politicians of similar type. There are many of these in Colombia, though one cannot say that they are all popular. Though Turbay was, and remains, a much more representative figure than his left-wing or upper-class critics recognise, his government was lack-lustre all the same, and was early on assailed by the M-19. The movement stole thousands of weapons from the army arsenal in Bogotá shortly after his election. It survived the subsequent capture of most of its members and, ostensibly to free them from gaol, held the assembled ambassadors to ransom in the embassy of the Dominican Republic during March and April 1980. With some support from Cuba the M-19 a year later in March 1981 mounted a small guerrilla invasion in the south of the country close to the border with Ecuador. Colombia thereupon severed relations with Cuba. President Turbay offered guerrillas an amnesty (Law 37 of 1981), but its provisions were not considered ample enough and it was overshadowed by his *Estatuto de Seguridad*, passed with military approval after the arms robbery. The political moment for amnesty was certainly not ripe. The *Estatuto de Seguridad* perhaps made little practical difference to security, but it was criticised as an exceptionally repressive measure.

³ But see M Latorre Rueda, *Elecciones y Partidos en Colombia*, Bogotá: Universidad de los Andes, 1974 and his essays in *Política y Elecciones*, Bogotá: Universidad de los Andes, 1980. For an English text, R A Berry et al (eds) *The Politics of Compromise: Coalition Government in Colombia*, New Brunswick NJ: Transaction Books, 1980.

Colombia's human rights record is not perfect—it is, for example, not as good as Venezuela's—but there has never yet been anything approaching systematic repression of civilians by soldiers and police on a Southern Cone scale. The *Estatuto* did not stop the M-19 lobbing mortar-bombs at the presidential palace. There was no censorship of any sort and criticism of the government was continuous, merciless and personal.

To the government's internal difficulties should be added international isolation. Colombia had differences with Nicaragua over the islands of San Andres and Providencia and over various lesser islands and keys, and was disappointed that the US did not on this question reciprocate the general support that Colombia gave to her on inter-American matters. Colombia had problems with Cuba: the Cubans considered that Colombia's competition for a seat on the UN Security Council was inspired by Washington; they gave the M-19 guerrillas of the Dominican Embassy asylum and a heroes' welcome to Havana when that siege was brought to a negotiated end and supported their incursion into the Putumayo. Colombia had also taken the most pro-British line of all the Spanish American republics except Chile during the Malvinas/Falklands War, in sharp contrast to Venezuela, with whom Colombia has unresolved border differences. In 1982 the republic looked dangerously alone. Some of the danger lay in Central America, and not just in the form of Nicaraguan claims to Colombian islands. Colombia might become a target for subversion from Central America. Both guerrillas and army watched Central America developments with interest: a guerrilla victory in El Salvador would undoubtedly have had a most powerful effect in Colombia—in that sense the republic was the largest though the least-pondered 'domino' in the area.

Belisario Betancur

Belisario Betancur, the Conservative candidate, won the presidential election for the 1982–86 term against a divided Liberal party. It was his third attempt. The most conspicuous plank in his platform had been low-cost housing, but his vast popularity derived not from any specific promise, nor from his humble origins and approachable nature, but primarily from his position as the opposition or 'non-continuist' candidate at the end of the Turbay government. Dr Alfonso López Michelsen, his principal opponent, was running for a second term—he

had been President from 1974 to 1978—and could not distance himself from the Turbay administration and its reputation for corruption, inertia and heavy-handedness. Though it had been Dr López who first argued the urgent need for a new drive for peace and attracted the support of many intellectuals by doing so, including that of Gabriel García Márquez, it was to be Betancur who from the start of his administration made the cause his own. Enjoying support in opinion polls at unprecedented levels and a master of public relations, he made the subversives offers that they could not refuse. He captured the initiative, and for the first time in many years it was the government and not the guerrillas that issued the challenges. The peace process involved many actors, and to understand its evolution one must examine the antecedents of the different guerrilla groups, the problems posed by death-squads, the cocaine mafia, the attitude of the armed forces, the numerous and intractable practical problems posed by peace-making, and the course of public opinion. The account of guerrillas and subversives that follows is necessarily tentative, as reliable information is not easy to come by and unreliable information abounds. I have tried to gain insights from their apologists and propagandists, who have had no cause to complain of not getting a hearing in the last two years.

FARC

The *Fuerzas Armadas de la Revolución Colombiana* are the oldest and largest guerrilla organisation in Colombia. Their origins can be traced back to the 'classic' *violencia* of the 1950s, and their literature emphasises their origins in peasant self-defence—*autodefensa campesina*—against the army in the Rojas Pinilla years and in 1964–1965 when it took the offensive against several so-called 'independent republics' in the departments of Tolima and Huila. The FARC provide the revolutionary credentials of the Moscow-line Colombian Communist Party, which would hardly appear revolutionary without such a link. The organisation claims to control twenty-seven fronts, but these vary in numbers and combativeness. In some areas the FARC are well rooted in the local population, though this probably owes more to organisation than enthusiasm. They recruit using methods similar to those of the regular army: local census, allocation of quotas of recruits, payment to their families. Discipline is severe, and there is formal indoctrination. They have raised funds from the *boleteo* or *vacuna* (vaccination)—demands on landowners—from kidnapping and from

levies on cocaine growing. The rural guerrilla is now thought to be richer than the urban party. The visible commander is the veteran Manuel Marulanda Vélez, *Tirofijo*. He has a legendary reputation for survival, but his pronouncements show a certain modesty about his own talents and about the degree to which the FARC pose an immediate threat to the army and the status quo. The FARC are far less aggressive than the M-19, some of whose leaders are ex-combatants of the FARC who left out of impatience. Something of the aura of *autodefensa* still pervades them. The army nonetheless in 1982 considered the FARC the most formidable long-term threat, and was more sceptical about the possibilities of a truce with them than about one with the M-19. This may have been because the army sees them as part of a wider communist strategy.

In the last three years it has clearly not been in the interests of either Cuba or Nicaragua or the Soviet Union that the FARC should be seen as making life difficult for the Colombian government, a leading member of the Contadora group and an advocate of negotiation in Central America. Many speculate that the FARC's adherence to the truce derives from orders from above and from abroad. There is no clear evidence for this argument, but it is plausible. It is not incompatible with other reasons: an ageing leadership conscious of military stalemate; the possibility of political gains to be made in local consolidation and in publicity that pictures the FARC as the senior, the 'responsible' guerrilla. The FARC gained a deal of such publicity when they became the first guerrillas to sign a truce with Betancur's peace commission at La Uribe, Meta department, on 28 March 1984.⁴

The M-19

The 19 of M-19 refers to 19 April 1970, the date of the presidential election of that year in which the followers of the then populist General Rojas Pinilla were allegedly robbed of victory. The movement has essentially Colombian origins, and its leaders have always insisted on its national and nationalistic character. It cannot be easily classified as a guerrilla or a terrorist movement. It has sometimes operated in the rural guerrilla mode, as in the Caquetá and in parts of the Central Cordillera, but its most spectacular operations do not follow normal guerrilla

⁴ The FARC's view of itself is reported in C Arango Z., *FARC Veinte Años. De Marquetalia a La Uribe*, Bogotá: Ediciones Aurora, 1984.

tactics. It kidnapped and murdered the trade union leader Raquel Mercado, but later confessed that the murder had been an error. Certain leaders, for example the late Carlos Toledo Plata, have been sincere in regarding clandestinity as merely an episode in lives they meant to dedicate to open political proselytism. From its origins it has shown of all the Colombian groups the greatest appetite for publicity: it stole Bolívar's sword, it tunneled into the Bogotá arsenal, it seized the Dominican Embassy. Its principal figure before he was killed in a plane crash in 1983, Jaime Bateman, was publicity-conscious to the verge of narcissism. The Colombian press, beginning with the Conservative *El Siglo* and including widely selling and unrevolutionary magazines such as *Cromos*, published extensive interviews with the movement's leaders, interviews granted from clandestinity or from gaol. (Many leaders have been in gaol more than once: the leniencies and complexities of Colombian law make it hard to keep anyone inside long.)

Despite all this publicity, it is hard to discern the exact aims of M-19 beyond such conjunctural objectives as the release from prison of members of the movement. There is an emphasis on nationalism, but this is not expressed in any concrete programme. The Colombian economy has always been largely in Colombian hands, and there is little xenophobic or anti-American feeling in Colombia. Nationalism is therefore the harder to articulate. There is also an emphasis on improvisation and on participation. The M-19 sees itself as agile, capable of surprise, inspirational, even *folclórico*, the political heirs of García Márquez's Macondo. One leader likens making the revolution to cooking a stew, with no fixed recipe but with this and that and the genius of the cook. The M-19 criticises the FARC's military posture as posing no real threat to the army at all—'In Colombia there are guerrillas in all the departments and nothing happens at all; the army has them all completely under control.' (see note 5) The political antecedents of the leaders are varied, and nothing useful can be deduced from their social origins. The movement's origins in an electoral frustration, that of 1970 which had ceased to have any meaning by the 1980s, and their insistence on participation made them look more promising material than the FARC for re-entry into unarmed politics, or at least politics where the guns did not go off. However, 'participation' was not defined.

The numbers of the M-19 are as hard to gauge exactly as those of the FARC, harder in that the FARC are relatively static. My impression is

that in the M-19 a core of leaders and veterans—no single figure has replaced Bateman—manage a more fluid rank-and-file. The M-19 has taken heavy losses but replaces them with apparent ease. It has rural contingents in Cauca and Valle some of the ranks clearly come from Indian Tierradentro—but the bulk of the membership is urban or small town. They are also most of them adolescent, of both sexes. The mid-teenage *guerrillero* features in the propaganda of both FARC and M-19. Young people are easily induced to join—anyone who has seen Colombian guerrillas on the frequent recent occasions on which they have been visible will have noticed that they are conscious of the glamour of arms and uniforms—and it is not difficult to launch them into the bloody confrontations that are an M-19 speciality. It is because they are so young, not because they are so fanatical, that they enter these fights in which so many get killed. In some *municipios* support for the M-19 among the young is notorious, and a vicious circle of unemployment, subversion and repression can be created. Yumbo, a large industrial suburb outside Cali, is such a case. In August 1984 the M-19 'took' Yumbo from within, and radioed the army to come and fight. The M-19 is not short of funds, which are obtained by robbery, kidnapping, extortion and, in all probability, drugs. It is not an austere puritanical movement. At the end of the Turbay government one of its leaders confessed that

making a revolution costs a lot of money. In seven and a half years I think we have spent around a hundred million pesos . . . at least seventy million pesos we invested in houses, cars, apartments which the army has taken. You can't have centralised accounting when you work illegally . . .

(Even the FARC nowadays confesses to expensive tastes such as faded blue jeans, Marlboro', tape-recorders, canned beer and Coca-Cola.)⁵ The old pretence that arms come from the enemy has been abandoned. Arms are bought. The M-19 signed the truce on 24 August 1984 at Corinto (Valle) and El Hobo (Huila).

Other groups

The *Ejército de Liberación Nacional* (ELN) and the *Ejército Popular de Liberación* (EPL) are smaller and more geographically restricted in their operations than the FARC or the M-19. The ELN was founded in

⁵ Quotations on M-19 from P. Lara, *Siembra Vientos, Recogerás Tempestades*, Bogotá: Editorial Fontamara, 1982, pp. 93, 120; on FARC's tastes, C. Arango Z., *op. cit.*, p. 19.

the mid-1960s under Castroite inspiration, and the group in which Camilo Torres spent a short time before he was killed. It became notorious for internecine arguments and executions, but survives and refuses any part in the peace process. The EPL is Maoist, now presumably of the Albanian persuasion. It has participated in the truce, and is held to be the one movement that has resisted any involvement with drugs.⁶

There are several more shadowy revolutionary organisations or criminal conspiracies masquerading as revolutionary organisations, and these have increased in number as the peace negotiations have excited divisions within the guerrillas.

The MAS

The *Movimiento Anti-Secuestros*, MAS, is a death squad ostensibly formed to execute kidnappers—since the mid-1960s Colombia has come to have the highest kidnapping rate in the world; most kidnappings are not politically motivated but kidnapping may well be the principal source of guerrilla funds in the last decade. Early in the Bentancur government the *Procurador* revealed that fifty-seven members of the armed forces were listed as under suspicion of complicity with its activities. Other para-military groups have gained notoriety, for example the *tiznados* of the Middle Magdalena, who blacked their faces. In that region all sorts of violence prevailed in the first months of 1984, variously explained as a counter-blast of landowners against guerrilla exactions, a concerted land-grab with the connivance and participation of the army, a purge of local peasant and trade union leadership Violence produces a dense fog. Though little can be said about them with any certainty, the existence of such groups as the MAS poses an obvious threat to the success of an amnesty. It is an article of belief on the Colombian left that the leaders of the Liberal guerrillas in the *llanos orientales* who accepted amnesties in the 1950s all met violent ends. The government is undoubtedly sincere in offering guarantees, but it has enemies that wish to make them ineffective.⁷

⁶ The EPL has now abandoned the truce, one of its principal spokesmen, Oscar William Calvo, was assassinated in Bogotá in November 1985.

⁷ Violence does not only produce a fog in the Middle Magdalena. In Cauca in the south at least half-a-dozen organisations claim to be active, and it is no longer possible to do more than speculate from a distance on who is doing what to whom or why. Colombian anthropologists long familiar with the area can no longer work in many districts. It is not a reactionary fiction that there is acute conflict between different guerrilla organisations and often within a single guerrilla organisation any more than it is a revolutionary fiction that death-squads exist and that amnestied guerrillas have been murdered by them.

The Mafia

It had been known for some time before President Betancur assumed office that there were links between the guerrillas and the cocaine trade. Some sources indicate that the FARC was initially opposed to coca cultivation for cocaine, but that the movement thereby brought on itself the hostility of both those growing the coca and the Mafia. It was more expedient to tax and control production. In its first years the Betancur government chose for the sake of peacemaking not to draw attention to this connection, and the emphasis placed on it by US Ambassador Lewis Tambs was considered unhelpful, or even an attempt to sabotage a negotiated settlement with the guerrillas of a type that the US opposed in Central America. Whatever Ambassador Tambs' motives were, few would now deny that his facts were correct. The FARC makes money out of coca, but is careful not to involve itself further. The M-19 has been careless: the late Ivan Marino Ospina declared his support for the Mafia's threat to kill Americans resident in Colombia in reprisal for the extradition of Colombians to the US; the other leaders made him recant, but it was a damaging mistake. Many commentators on the M-19 assault on the Palace of Justice sought an explanation related to drugs: the M-19 had been paid to carry out the operation by the Mafia to bring a halt to extraditions by destroying the records. The explanation is far-fetched, as the seizure of the court is better explained by their need for a major propaganda success, but many papers were certainly destroyed. Whatever the exact relationships are, there is no doubt that the illegal resources of the drug traffic have both helped subversives obtain a steady supply of modern weapons—an M-16 rifle '*puesto en Bogotá*' (placed in Bogotá) is said to cost US\$1,000—and that the drug trade has contributed to the atmosphere of menace and corruption in which all sorts of extremism can flourish.

The course of the truce

The FARC, as has been noted, signed a cease-fire in March 1984. There have been occasional skirmishes with the army on some fronts, and not many landowners within the FARC's reach would agree that they have ceased operations, but on the whole, with the main body of the movement, the truce has held. They have begun the formation of a legal political arm, the *Unión Patriótica*. Dissidents have formed the Ricardo Franco Front which insists on continuing the armed struggle, and there has been some fighting and executions within the guerrilla. ('You have

to realise,' said one well-placed official observer, 'that the Colombian guerrilla is even more disorganised than the Colombian government.' The comparative quiescence of the FARC remains the most important tangible achievement of Betancur's search for peace.

The M-19 did not sign a cease-fire agreement until August 1984, and it announced that it considered it broken in June 1985, less than a year later. The movement gave as its reasons for resuming the struggle the killing of M-19 members. One prominent leader, Carlos Toledo Plata had been shot before they signed the truce. An attempt was made on another, Antonio Navarro Wolf, shortly before the announced resumption of hostilities, and there were other losses. The evidence however points more towards miscalculation than to frustration for an explanation of the June decision.

The M-19 pursued an erratic course after August 1984, and many of its actions were deliberately provocative towards the armed forces. It claimed the right not only to uniforms and arms—a thorny enough question—but to a fortified encampment with mined approaches, which was certainly not envisaged in the truce agreement. It began to organise *barrios* in Cali, but in an ambivalent para-military manner—the ambivalence about 'fighting for peace' is apparent in the movement's propaganda. Enrique Santos Calderón, a journalist and member of several peace commissions, contrasts its attitude with that of the FARC. The FARC also invokes its numerous dead and the aggressions it has suffered in this never-perfect cease-fire. But it does so with the experience and realism of an essentially peasant movement with more than twenty years struggle behind it, which knows that this famous peace implies a long slow haul, with many interruptions. The M-19 makes its allegations with all the impatience and indignation of an urban militancy, intellectualized and demanding which appears to believe that peace crowned with noble social reforms and impeccable democratic openings is just round the corner.⁸

The demands of the M-19 were made as if the movement was the arbiter of the situation, or at least as if it was the government's equal interlocutor. The leaders seem to have been convinced of their own overwhelming popularity, to have taken the prudential tolerance and passing goodwill that the inhabitants of such towns as Corinto showed them as evidence of profound popular support, to have generalised

⁸ E. Santos Calderón, *La Guerra por la Paz*, Bogotá: CEREC, 1985 (prologue by G. García Márquez), p. 259. This book contains in an appendix the principal documents of the truce. For the M-19's view of it before they resumed hostility, see *Corinto*, Bogotá: Ediciones Macondo 1985.

from Yumbo. They may have decided to break the truce in June 1985 on the calculation that the general strike announced for 20 June would lead to some sort of general upheaval, or at least a repression that would swell their ranks. What happened, and what continued to happen as they skirmished with the army and police in the Quindío and in Valle, was that their arrogance and impatience rapidly eroded their credibility and popularity. This was apparent in the universities, where their audiences dwindled and even turned hostile: in the climate of liberty and respect that Betancur fostered people felt a right to their own opinions, and resented the M-19 style of providential dictation. Public opinion was not with them when they broke the truce: in their raids on virtually defenceless provincial police posts, it was even for once on the side of the police. They miscalculated their political support, and raised the stakes continually with no regard for either the delicacy of Betancur's political position, which they weakened by making him look a dupe, or for the obvious limitations of his constitutional powers. This miscalculation was to become fatally obvious in November.

Prior to November those who wished to excuse the M-19 for breaking the truce—and peace being the wish of most Colombians, excuses were necessary—would blame the armed forces for their lack of conviction about the possibilities of peace and for underhand harassment of the guerrillas. Many officers recognised that the alternative to some sort of political solution to the guerrilla problem was a confrontation that even if it did not get worse would go on draining resources and distracting the armed forces from more important tasks. The Malvinas/Falklands War made all Latin American armies acutely conscious of their weaknesses, and the Colombian army was no exception; the Nicaraguan claim to Colombian islands had intensified Colombia's strategic concerns. Yet soldiers inevitably disliked many aspects of the internal peace-making. As any army in similar circumstances would, they found it hard to stomach any implied 'no go' areas and the guerrilla insistence on making a show with arms and uniforms. The new civilian enthusiasm for 'Don Manuel', the dignification of the enemy, struck them as civilian ingratitude and naivety. It is the army and the police that take the losses, not the politicians.⁹ The army was also in many respects better informed than

⁹ L. Santos Calderón quotes Ministry of Defence figures as 603 guerrillas, 284 army and police dead between July 1984 and July 1985, p. 28. (Cf. 1981 sixty-seven army and police dead, 1982-fifty-one, 1983 eighty-five; official figures from *El Mundo*, Medellín. Documentos No. 82, 23 July 1985, 'La Reforma Política y el Proceso de Paz' y 'La Paz en Citras', *El Tiempo*, Lecturas Dominicales, 30 June 1985, also shows an ascending curve of military and police deaths under the Betancur administration, but declining curves for assaults, terrorist acts and civilian deaths from political causes up to that date. Kidnappings increased.

the civil government about the guerrillas. Though his judgement of the needs and possibilities of the political moment is hard to fault, Betancur may have overestimated guerrilla coherence and maturity, and he was not at this best in handling military sensibilities. It would have been better if the conditions needed for the peace agreements could have been secured without the visible friction that led to the dismissal of his first Minister of Defence early in 1984 for speaking out of turn. The Colombian army *no es deliberante*: it is constitutionally debarred from uttering opinions, although its commanders, and particularly the Minister of Defence, are under constant pressure and temptation to do so. The dismissal of General Landazabal did still most military criticism, though his successor referred pointedly to the articles of the Constitution that reserve the carrying of arms and the wearing of uniform to the armed forces. As the peace process ran into increasing difficulties the army's prestige rose. It gained respect by keeping its annoyance within strict constitutional bounds and by maintaining a constitutional silence. Though it might have been possible to have involved the army more positively in peace-making, the critical failures of the past eighteen months cannot be attributed to military hostility or indifference. The M-19 goaded the army much more than the army goaded the M-19.

The Betancur administration was further criticised for a lack of central control over the process, for not providing an adequate system of civilian supervision and verification, for not putting enough money into rehabilitation schemes, for being ill-defined about the 'national dialogue' particularly desired by the M-19, for insufficient agility with the sort of localised agrarian reform that certain areas demanded.¹⁰ Colombia has a highly critical political atmosphere (an assertion that can easily be tested by a visit to Venezuela or Ecuador) and economic conditions give Betancur little room for manoeuvre. All he could spend, in the phrase of one sympathetic critic, was his popularity.

The seizure of the Palace of Justice and the Armero disaster

When the M-19 seized the Palace of Justice on 6 November 1985 there was no possibility that the President could have negotiated anything but a rapid surrender of the assailants. Their challenge was not for some

¹⁰ For a good sample of these debates see C de la Torre, *Reformas Políticas—Apertura Democrática*, Bogotá: Editorial Nikos and Editorial Oveja Negra, 1985.

provincial *modus vivendi*, but attacked the heart of a republic quite as legalistic as any European state—the legal strand is one of the strongest in the Colombian political tradition. The President's authority would not have withstood a prolonged negotiation such as the M-19 had in mind, let alone the absurd concessions that they demanded. Apart from the usual provision of massive publicity, these included a 'trial' of his management of the peace negotiations, to be conducted under M-19 supervision.¹¹ It was not only the army that demanded a quick solution. The reaction of the general public in Bogotá was that the M-19, a movement that had repeatedly defrauded the hope for peace and abused the President's trust, had now flagrantly overstepped the bounds of the negotiable by an act of violent defiance in the centre of the capital—the Palace of Justice flanks the Plaza Bolívar opposite Congress, within a couple of hundred yards of the Palacio de Nariño, the Presidency. The Supreme Court is an independent body, which has on occasion inconvenienced presidents and generals. Bystanders applauded the troops at the siege, and on their way north through the city back to barracks. Of course, no one can say whether they were a representative sample, and they applauded before it was known how many had died in the operation.

Once it was known how many lives had been lost opinion divided. The President's critics now said that he should have prolonged the negotiations to save the hostages, that he had lost control of the siege to the army, that prior intelligence about the attack had been ignored. He was declared *persona non grata* by one university—the *Externado*, which has a strong law tradition—and the judiciary went on strike. The family of only one of the judges killed attended the state requiem. The army was seen as having been greedy for an 'Entebbe' and to have failed to achieve one. Sinister rumours spread about what had happened in the heat of the battle and in the aftermath. As Dr López commented, '*el éxito tiene muchos padres*' ('success has many fathers') What was already an intense national debate was then stilled by the act of God that destroyed Armero.

However, the probability was that Betancur would have won the debate. Former Presidents, an influential body in Colombia, were unanimous in his support, though President Turbay could not resist a reference to the patient handling of the Dominican Embassy affair. The FARC condemned the M-19's action as having provoked a 'useless

¹¹ For the demands in full, see *Semana*, 18 November 1985

genocide'. Rather than widening the differences between the President and the armed forces, the traumatic demonstration of the consequences of violence and the hazards of force brought them closer. A successful 'Entebbe' might have left them further apart.

The peace process has been written off as mortally wounded before, when the M-19 attacked Florencia, when it 'took' Yumbo after the assassination of Toledo Plata. The events of the Plaza Bolívar were the most severe blow to Belisario Betancur's prestige, and seemed to bear out those critics who said that sentimental policies would end only in more blood and tears, but they alter circumstances less than their drama would suggest.

They brought closer the prospect of repression 'on an Argentine scale': Betancur's Minister of Government, Dr Jaime Castro, spelt out more bluntly than ever before that the continued subversion of the country's democratic institutions was more likely to end in repression than in anything else, and his warnings received illustration from the concluding trial of the Argentine *junta* members in Buenos Aires. There is at least a growing awareness in the country that repression could be provoked that would make Colombians look back with nostalgia to the mild days of the *Estatuto de Seguridad*. There is also more military activity.

Dr López, who is by turns Betancur's supporter, critic and rival, and whose comments have a way of focusing the national debate, had declared earlier last year that the country would never be the same after Betancur, and that the peace process was something that his successor would inevitably inherit, and would have to manage willy-nilly. There is no reason yet to revise that judgement. The majority of the guerrillas are still involved in a truce and dialogue that implies, in the words of Enrique Santos, 'an undertaking made before all the citizens of the republic and before their own followers that they cannot renege on at just the least pretext without incurring the great political cost of losing their credibility. It is not so simple to re-activate a guerrilla in recess just like that, nor to regenerate sympathy for the armed struggle once one has talked so much about peace.'¹⁷ The peace process has robbed the guerrilla of mystery, its failings and limitations have become more apparent, some of its declarations and analyses less convincing, even boring. Those who have refused the cease-fire naturally include the most violent guerrillas, and they must carry out violent acts to show

¹⁷ E. Santos Calderón, *op. cit.*, pp 177-8.

their independence, to obtain resources or to maintain discipline in their ranks. The mass grave of 158 youths recently found in Tacueyo Cauca is evidence of such 'discipline'—executions have been claimed by the Ricardo Franco splinter group of FARC. Peace offers have fractioned the guerrillas, which is one reason why the immediate results are disappointing, but it is significant that the Tacueyo massacre has been repudiated by all other guerrilla groups, whether they have accepted the truce or not. The desire for an end to pointless violence has not diminished, and Betancur's successor will not be able to return to 1982. Whoever is the next President will have to go on looking for a distinctively Colombian peace—the Colombian government is rightly wary of the attempt by President Reagan and his Secretary of State, George Shultz, to blame the seizure of the Palace of Justice on the Sandinistas.¹³ He will have to manage the unprecedented evolution of the FARC's *Unión Patriótica*, and he will no doubt have to survive further violent episodes that will make peace look far off once again. Such episodes do not mean that Betancur was pointing altogether in the wrong direction. The cost of violence in Colombia, not only in lives but in lost production, lost investment, capital flight and all sorts of expensive distortion is inordinately high, and most of all that cost is paid by the poor. Betancur is right in thinking that in Colombia peace would be more revolutionary, or at least more progressive, than the search for revolution by increasingly violent means.

¹³ The M-19 has maintained an office in Managua. The Colombian government has recalled the Colombian Ambassador to Nicaragua 'for urgent consultations'.

The World Bank: a new role in the debt crisis?

The International Monetary Fund is dead; long live the World Bank! The message brought by US Secretary of the Treasury James Baker to the Annual Meeting of the IMF and World Bank in Seoul, Korea, in October 1985, wasn't quite that explicit, but it could easily be read between the lines.

Three years of experience with the IMF model for containing the debt crisis came to a climax in 1985 with clear evidence of disaster. Mexico, which had been show-cased as the bankers' idea of a model country, fell out of compliance with its IMF agreement after an expensive national election. Instead of displaying humble gratitude to the banks for granting his country the 'reward' of a multi-year debt rescheduling, the Finance Minister, Jesus Silva Herzog, used the formal signing ceremony to deliver a threat: if Mexico did not receive a positive net transfer of money from the banks, it would not pay its interest in the future.¹

On the South American continent the news was just as bad. The newly-elected governments of Brazil and Peru both announced that they didn't want any IMF programme in the foreseeable future. And Argentina, which made a stunning turn-around in just a few months' time from bankers' nemesis to bankers' favourite, was in compliance with the IMF only because it had designed its own stabilisation programme and sold it to the Fund, rather than vice versa. The Argentine stabilisation programme, although rubber-stamped by the IMF, contains one important element which the Fund has not countenanced elsewhere: a heavy emphasis on price controls.

The bad news for the IMF didn't end there. As an article in the *New York Times* explained in November 1984, the IMF and World Bank have always been the first to be paid back when debtor countries have anything to spend in a debt crisis, because they are what amounts to the international credit rating agency.² But even as that article was published, the Fund was struggling with the fact that more than twenty countries (many in Africa) were *not* repaying their borrowings from the

Fund. In 1985 newspapers carried the story that the IMF couldn't even collect its own debts. And if this was true, how could it ensure repayments of the much larger debts to commercial banks?

The IMF was designed to provide short-term support to the balance-of-payments of troubled debtors, and is supposed to operate as a revolving fund. Its loans (technically speaking, 'purchases' of hard currency with local currency) are repayable within a three to five year period after they are disbursed. The Fund's net lending in the years the debt crisis broke, 1981-4, amounted to a total of \$28 billion, or an average of seven billion each year. Net lending slowed to a trickle in 1985, and in the next three years repayments are scheduled to amount to \$21 billion. The IMF will soon become a net recipient rather than supplier of funds to Third World borrowers.³

Those borrowers have, through the years, tolerated the imposition of IMF conditionality only because they wanted the money from the Fund itself and from other creditors that pegged their own lending to compliance with an IMF austerity programme. Even before 1985, compliance with Fund-imposed conditions was notable mostly for its absence. If the IMF were a private consulting firm which had to sell its advice, it would have gone out of business long ago.

The bargain has always been money for conditionality. As the money runs out, so will the patience of governments, whether left or right in their political complexion, with conditions which have long been regarded as more in the interest of the creditors than the borrowers.

The IMF's future as a dispenser of funds is now dependent on the willingness of past borrowers to return large sums of money to it even though they are still in crisis. In the words of the Morgan Guaranty Trust newsletter, 'Should Brazil or Mexico wish to enter into a second extended-facility arrangement, they too could find—as Chile discovered several months ago when it requested a three-year facility—that new loans from the Fund roughly match the repayments of principal from prior drawings falling due after 1986.'⁴

The IMF's credibility has also been hurt by the very efforts of the Reagan administration to strengthen its authority. Every major debtor country was required to conclude a high conditionality stand-by or extended facility with the IMF as a condition for a debt re-scheduling agreement. Because such agreements were essential for preserving the

⁴ *Loc. cit.*

stability of the international banking system, it was only a matter of time until even the most conventional and conservative of Latin American technocrats realised that they were in the driver's seat and could write their own ticket, as Argentina has done.

The World Bank gets wheeled out

With the collapse of the IMF 'let's pretend it's just temporary' strategy, US officials had to cast about for a new gimmick. Upgrading the role of the World Bank, which has been out of the limelight since the inauguration of Ronald Reagan and the outbreak of the crisis, was an obvious solution, although it is doubtful that it will prove to be the correct one.

Although Treasury Secretary Baker's name is on the plan which puts the bank in a starring role, the original idea may have come from the Federal Reserve Board Chairman, Paul Volcker, who has played a strong supporting role at Baker's side since the initiative was unveiled. In May 1985, Volcker proposed a wider role for the World Bank in a speech presented to the Bankers' Association for Foreign Trade, and he developed the idea in testimony before Congress last summer. 'Where have you guys been?', he challenged World Bank executives as long ago as July 1984.⁵

The Bank executives' full response to that question was probably not printable in a family newspaper. There are solid reasons for the Bank's position on the sidelines of the debt crisis, which Mr Volcker, not a stupid man, should have been aware of. Putting it simply, since 1981 when Ronald Reagan was inaugurated US President and A W Clausen succeeded Robert McNamara as President of the World Bank, the Bank has been caught between the Scylla of the capital markets and the Charybdis of the Reagan administration's ideological hostility to multilateral banks.

The World Bank depends on borrowing money in the world's capital markets for most of the money lent by its hard-loan component, the IBRD. It is dependent on the support of the US administration, its largest shareholder, for increases in subscribed capital which would permit an increase in lending by the IBRD, since its charter does not permit it to make loans in excess of its capital. And it is almost totally dependent on government allocations for its soft-loan component, the IDA.

⁵ Clyde H Farnsworth, 'A troubled rule at the World Bank', *New York Times*, 2 September 1984

During the more than four and a half years that elapsed between the Reagan inauguration and the Baker initiative, the US administration systematically weakened the Bank by denying it the financial support it needed to expand lending. Clausen's efforts to crank up a new general capital increase for IBRD were received coolly. Commitments from the US to the Sixth Replenishment of IDA that were supposed to be disbursed over three years were stretched out over four.

When the seventh replenishment of IDA was negotiated, the US fell out of step with the other Part I (developed countries) contributors by refusing to contribute its full pro-rated share of the total agreed upon. This so angered the other Part I members that several of them agreed to contribute to a separate pool of funds, and ruled that US-based firms would not be permitted to bid for contracts financed by those funds. (The episode lends support to the theory that the whole foreign aid business is nothing but an export-financing scheme.)

The other side of Clausen's dilemma was the scrutiny of the capital markets from which the Bank borrows most of its funds for lending. Although critics blame lack-lustre executive leadership and bureaucratic red tape for the Bank's failure to come to the rescue with large amounts of debt relief, there were compelling structural reasons to explain why the Bank had evolved in this way.

Several critics suggested, for example, that the Bank should abandon its highly conservative 1:1 ratio of loans to capital. Commercial banks, they suggested, have ratios which are close to 20:1 and the Bank's 'old fogeyism' was preventing a much-needed expansion of lending. Changing the articles of agreement to allow just a 2:1 ratio would instantly double the money it could lend without going through the cumbersome process of a capital increase.

It all seemed so easy. Clausen knew that it wasn't, and rejected the idea. He had come to the World Bank from the presidency of what was then the world's largest commercial bank (Bank of America) and was certainly not unaware of the seriousness of the debt crisis nor unwilling to increase new and untied lending. Although it is hardly possible to 'bail out' the commercial banks (the sums needed are just too big), increased lending by the World Bank could make life easier for them in the short run.

But the IBRD raises the bulk of its funds from large investors, state and private, who see it as a good investment, and the guarantee of the Bank's developed member-countries is what makes it a good investment. Raising the 'gearing ratio' of loans to capital would dilute

the guarantee that these lenders depend upon and instantly raise the Bank's cost of capital on new borrowings. It would make the Bank much more dependent on the perception of the market, and in the mid-1980s that perception would not be favourable. If commercial banks no longer consider loans to Latin America (and troubled borrowers elsewhere) as good business, the more conservative bond markets would certainly shun investments in an institution whose main business was bailing those troubled borrowers out of their commercial bank loans.

Unlike the IMF, which was designed to operate in (short-term) crises, the World Bank's method of lending made it a much less suitable tool for emergency bail-outs. The Bank's charter (Article III, section 4(vii)) states that 'Loans made or guaranteed by the Bank shall, except in special circumstances, be for the purpose of specific projects of reconstruction or development.'

In a debt crisis, however, the most urgent need of a borrower is not for projects which will have a pay-off, if any, only in five or ten years' time; the country needs the money now, to pay debt service and this year's import bill. Project loans are actually counter-productive in such an environment if they tie up other complementary resources which might be put to more immediate use elsewhere in the economy. World Bank loans have traditionally done just that: it has been a deliberate policy of the World Bank to require the borrowing government to demonstrate its commitment to projects financed by the Bank by pledging so-called 'counterpart' funds, and making complementary investments of its own.⁶

The World Bank was the first institution to study the problem of debt repayment and debt crises seriously (in the studies by Dragoslav Avramovic published between 1958 and 1965) and is still the major source of statistics on debt as publisher of the annual *World Debt Tables*. Yet, ironically, its own lending operations assumed that the flow of external capital towards its Third World borrowers would always continue, despite the reverse flows of interest payments and amortisation of capital required by the IBRD's 'business-like' loans.

In the occasional national debt crises of the 1960s and 1970s, the World Bank urged other creditors to reschedule repayments, but refused on principle (that is, with a careful eye on the rating of its bonds in the capital markets) to reschedule its own. The only debt-

⁶ Ernest Feder, *Perverse Development*, Quezon City, Philippines: Foundation for Nationalist Studies, 1983, pp 236-41

management technique which McNamara used when net transfers from the World Bank became negative in 1970 after he took office was the massive expansion of gross new lending which allowed borrowers to cover their old debt service with little pain. World Bank lending, like commercial bank lending, resembled a Ponzi scheme, with old debt service paid out of new borrowings.

Clausen was well aware of this fact and prepared to continue the game. Just before he assumed the presidency of the Bank, he told an interviewer, 'If we don't provide this expanded level of support [for the multilateral agencies]—comes the revolution. It's as simple as that. We have to do it or else we will destroy ourselves.'⁷ But the 1982 debt crisis could not be patched up according to the old model of the 1960s and 1970s. When Clausen tried to push the same buttons that McNamara pushed, he got no response.

Clausen has been responsible for several innovations in Bank policy and procedures. His first steps upon taking office were to move Bank lending from a fixed-rate to a floating-rate basis, and to institute new commitment fees for IBRD loans and IDA credits. These innovations made the World Bank look more like a commercial bank, and contributed to the fat profits the Bank has declared in recent years.

The commitment fees reduced the net transfer from the Bank to its borrowers, but floating interest rates, contrary to expectations, actually reduced the interest burden to borrowers. When floating rates were introduced in 1982, interest rates on bank loans were at an all-time high of 11.6 per cent. The switch to a floating-rate system permitted the Bank to pass on savings to its floating-rate borrowers as the interest rates on its own borrowing from the capital markets fell. Under the variable rate system, rates on all outstanding loans are reset every six months to reflect the Bank's own cost of borrowing: rates charged to the Bank's borrowers have fallen from 11.43 per cent in 1982 to 8.82 per cent in the last half of 1985.⁸

These interest rates are somewhat deceptive, however, as the Bank tries to borrow at the lowest *nominal* interest rate. That is, it borrows in currencies which have a low interest rate and passes the foreign exchange risk on to its borrowers. During the Clausen years the Bank has been a pioneer in the sophisticated business of currency and interest-rate 'swaps' with other investors. 'Swaps' have allowed the bank to borrow high-interest funds in US dollars and swap them for

⁷ 'Clausen will help those that help themselves', interview, *Euromoney*, December 1980, p. 35

⁸ World Bank, *Annual Reports* 1982, 1983, 1985

nominal low-interest funds in Swiss francs, deutschmarks and yen. In this way, the Bank can borrow more funds in those markets than the national authorities allow them to borrow directly.

More immediately important to the borrowers, however, are the innovations on the lending side of World Bank operations. Here the changes have moved in three interrelated directions as a result of the debt crisis: towards more programme lending, more policy conditionality and more emphasis on encouraging private investors. All three are responses to the debt crisis.

Structural adjustment loans, or SALs, were introduced in 1980, as a response to the second 'oil shock'. The Bank perceived, incorrectly as it turned out, that the price of oil would continue to rise in real terms in the 1980s. But it was also, and more prophetically, an anticipation of and an attempt to avert the impending debt crisis, since commercial banks were displaying increasing reluctance to raise their exposure to many Third World countries.

SALs were unlike the usual project lending of the Bank because the funds could be quickly disbursed and used to pay for general imports. Untied financial support in exchange for policy changes in the borrowing country: the basic bargain for World Bank SALs is the same as that of the IMF stand-by arrangements and Extended Fund Facility. This has led to considerable blurring of the distinction between the roles of the two Bretton Woods institutions and to occasional jurisdictional wrangles between them.

A report on the earliest structural adjustment programmes (1 February 1980 to 30 June 1981) revealed the far-reaching range of the Bank's conditionality under these loans: trade and exchange-rate policies, policies in the energy, agriculture, and industry sectors, the review of national investment priorities, the financial performance and efficiency of public sector enterprises, the budget, tax policy, interest rates, and debt management—no important sector of the borrower's economic life is left untouched.⁹

This obviously raises questions of how World Bank SALs differ from IMF Extended Fund Facilities, and it is a question which the Bank and Fund themselves have not always been able to answer. The official policy pronouncement on the subject was approved in 1967 and revised in 1970. It decreed that the Bank should have primary responsibility for 'the composition and appropriateness of development programs and

⁹ Pierre M Landell-Mills, 'Structural adjustment lending: early experience,' *Finance and Development*, December 1981, pp 17-21

policy evaluation, including development priorities', while the Fund had primary responsibility for 'exchange and restrictive systems, for adjustment of temporary balance-of-payments equilibrium and for evaluating and assisting members to work out stabilization programs'.¹⁰

The Bank and the Fund do not disagree fundamentally on the major issues of policy conditionality. The Bank, like the Fund, opposes most forms of trade and payment restrictions and tries to promote the interests of foreign investors. When the two institutions clash, it is more over means than ends.

One significant difference is that the Fund has operated throughout its existence mainly in situations of foreign exchange crisis, since its services were not needed when capital was flowing freely into a country. The Bank, by contrast, evolved during decades when most countries were enjoying foreign capital in-flows and its role was that of channelling the funds from itself and other lenders into what it decreed to be the most important development priorities. Its bureaucratic structure is not accustomed to operating in today's conditions, when the capital in-flows dry up and reverse direction. The Bank's projects run into severe problems when the borrowing government can't afford to allot the necessary 'counterfeit' funds or supply the essential infrastructure, which helps to explain why the Bank failed to meet its own lending targets in the fiscal year 1985.

The Bank's SALs, however, are even more ambitious than IMF programmes because they intend a more lasting effect. IMF austerity measures, such as budget-cutting and credit ceilings, can be, and regularly are, reversed quickly as soon as the desired money is disbursed. Bank SALs clearly intend to make more lasting institutional changes which cannot be so readily reversed.

This more lasting effect can be a promise or a danger, depending on one's opinion of the wisdom of the Bank's development philosophy. Tony Killick, a critic of IMF austerity programmes, believes that World Bank conditionality is significantly different from that of the IMF and represents a hope for the future development of the country he studied, that is, Kenya.¹¹

Robin Broad, who studied the implementation of IMF and World

¹⁰ Edward S Mason and Robert E Asher, *The World Bank since Bretton Woods*, Washington DC: Brookings Institution, 1973, p 551.

¹¹ Tony Killick, (ed), *The Quest for Economic Stabilization: The IMF and the Third World*, New York: St Martins Press, 1974.

Bank programme loans in the Philippines, sees no essential difference between the two. Indeed, she concluded that the World Bank, discreetly coached behind the scenes by the IMF, succeeded in achieving exactly those institutional changes which the IMF had tried, but failed, to implement. She perceived both programmes as aimed primarily at destroying protectionism and forcing the adoption of a strategy of export-led growth.¹²

SALs were not the only vehicle through which the World Bank transferred non-project tied money in exchange for policy changes by the recipient country. Sector policy loans, in which the policy changes were directed at a particular but important sector, also helped to move money. In the fiscal year 1985, more than one billion dollars was committed in sector adjustment loans, compared to only 232 million in SALs.¹³

Another programme with which the Bank tried to meet the new requirements of the post-1982 debt crisis era was its Special Action Programme or SAP. The emphasis in this programme was on speeding up disbursements, which normally lag several years behind commitments, in order to make money available in a hurry to needy borrowers. The programme, which was in effect for only two years, succeeded in raising the percentage of disbursements to commitments from 61 per cent in 1982 and 1983 to 72 per cent in 1984 and 76 per cent in 1985.

But all of these programmes together were only a drop in the bucket compared with the annual outflow of capital from Latin America. Of the ten major debtor countries, only the Philippines and Yugoslavia received SALs. Until the Baker initiative, it was agreed that non-project lending should not exceed 10 per cent of the Bank's total lending programme, or 30 per cent of its lending to a specific borrower. And it must be remembered that without a capital increase for the IBRD, and expanded contributions to IDA, all these special programmes were merely pushing money around from some borrowers to others and from future years to the present, not making more of it available.

Brazil illustrates the drawbacks of this programme. It was one of the main beneficiaries of the SAP: its borrowings increased from an average of \$299 million per year in 1980-82 to an average of \$935 million in 1983

¹² Robin Broad, 'The Transformation of the Philippine Economy', *Monthly Review*, May 1984, pp 11-21

¹³ 'Strengthening the LDC debt strategy', *op. cit.*, Table 17, p 10

and 1984.¹⁴ But when the disbursements were used up, Brazil still could not afford to supply the counterpart funds needed to complete the projects and now has to begin repaying some loans on projects which are not even completed. Net transfers from the World Bank to Brazil may be negative in 1986.¹⁵

Promoting private enterprise

The World Bank's contributions to managing the debt crisis are not limited to lending its own money. The Bank has always considered its real mission to be the promotion of private loans and investment in the Third World.¹⁶ The conditions attached to its own lending have pushed to improve the climate for private capital (including emphasising changes in the borrower's legal and taxation system which favour foreign investment). And its persistent attempts to encourage commercial banks to consider selected Third World borrowers as excellent credit risks mean that it bears a considerable share of responsibility for the current debt débâcle. It is, even now, encouraging India and China to get ever deeper into debt.¹⁷

Since the outbreak of the debt crisis, the Bank under Clausen's leadership has redoubled its efforts to entice private capital to the now much less attractive Third World arena. It has three new strategies to promote private capital flows: for the banks, new forms of co-financing; for equity investments, more activity by its International Finance Corporation subsidiary, and a new investment guarantee institution, MIGA.

Clausen's former institution, the Bank of America, was the first commercial bank to co-finance a project with the World Bank (in 1976). 'I liked it then as a commercial banker; I like it now as a development banker', he said in a 1982 interview.¹⁸ In January 1983 the Bank

¹⁸ 'A conversation with Mr Clausen', *Finance and Development*, December 1982, p 7.

introduced a new type of co-financing with commercial banks, which they called the B-loans, to distinguish them from the Bank's traditional lending.

The new programme permitted a closer relationship between the World Bank and the private banks in which the World Bank would either (1) participate directly in the later maturities of the loan, or (2) guarantee the later maturities, or (3) accept a contingent liability if a portion of a loan remained unpaid after expiration of the original maturity. This would happen if a borrower were guaranteed that its annual debt-service payments would remain stable although interest received by the commercial banks would fluctuate according to the market. If interest rates rose, the borrower would pay full interest but reduced amortisation, and the unpaid amount would be payable after the contracted expiration date. It is this unpaid amount that would be guaranteed by the World Bank.

The advantage to the borrower in these cases, the Bank stated, would be the availability of loans for longer periods and at better rates than the borrowers could normally obtain in the market. For some countries, of course, the money would not have been obtainable at all from the market without the Bank's participation. The lenders would receive 'comfort' from their association with the World Bank and the right to 'exchange of information and joint consultation' on the economic condition of the borrowers.

The latest (fiscal year 1985) annual report states that eleven B-loans, utilising all three options (direct participation, guarantee and contingent liability) had been signed in 1984 and 1985. The directors expressed satisfaction with the pilot programme and extended it for another year.

In mid-1985, however, the Bank got into trouble when the US Treasury objected to its plan to guarantee \$200 million of commercial bank lending to Chile as part of a total rescue package amounting to more than a billion dollars, including one of the Bank's own SALs. The objections forced the World Bank to rewrite its loan and the guarantees, this time tying the money to a project to co-finance highway construction. Under the new plan the World Bank would supply \$140 million and guarantee a further \$150 million of bank loans.

This episode suggests that the Bank's guarantee power will be used sparingly, but it also illustrates the critical role that the guarantee function can play. Despite the US Treasury's reluctance, it 'became convinced bankers wouldn't lend Chile the money it needs to cover its

international payments deficit this year and next without the World Bank guarantee, and that could push Chile to default on its \$20 billion foreign debt.' A senior US Treasury official was quoted as saying that the Treasury didn't want to 'put Chile to the wall and play Russian roulette with the banks'.¹⁹

The B-loan strategy, like most other components of the official management of the debt crisis, assumes that the capital market for the Third World will get back to normal in the near future. But what if it doesn't, as seems more likely? Guarantees are cheap, as long as they are never used. But if they ever have to be used—if the debt crisis gets worse rather than better—they will be either very costly to the guarantor, or worthless.

The direct investment solution to the debt crisis is popular with the Reagan administration, and the World Bank is trying valiantly to promote it. Private foreign investment has its disadvantages, of course; one reason for the fad for sovereign loans in their heyday was the disillusionment on the part of both investors and host countries with foreign equity investment. Countries were unhappy because vital parts of their economies were under foreign control and profits were shipped out of supposedly capital-short economies; investors were vulnerable to exchange controls and nationalisation, as well as taxation and labour legislation which hobbled their freedom of action.

The Bank's sponsorship of the Multilateral Investment Guarantee Agency (MIGA), which was approved by the Board of Governors at the 1985 annual meeting, attempts to promote a new surge of investment by providing insurance against those fears of investors. MIGA is authorised to cover private investors against these risks:

- Risk of host government restrictions on currency conversion and transfer.
- Risk of loss resulting from legislative actions or administrative actions and omissions of the host government that have the effect of depriving foreign investors of ownership or control of, or substantial benefits from, their investments.
- Risk of repudiation of government contracts where investors have no access to a competent forum, face unreasonable judicial delays, or are unable to enforce rulings issued in their favour.
- Risk of armed conflict or civil unrest.
- Other non-commercial risk.

¹⁹ S Karene Witcher, 'US Backs Plan by World Bank for Chile loans', *Wall Street Journal*, 1 July 1985.

MIGA will have a capital base of SDR 1 billion, with a complicated voting formula designed to assure rough parity between capital-exporting and capital-importing countries. In fact it seems designed to offend or threaten no one. Since other investment guarantee programmes such as the US's OPIC already exist, MIGA is intended to supplement such schemes through co-insurance and re-insurance, and is for investments that are not eligible for national or private coverage. It will, however, give the World Bank yet one more handle with which to lobby governments to improve the climate for foreign investment.

The International Finance Corporation has come into new prominence in the current climate of acclaim for the private investor as the key to development. Although still much smaller than the IBRD and IDA, the International Finance Corporation, the Bank's subsidiary devoted to direct lending to and co-investment with private, including foreign, investors is in the process of doubling its capital base and operations. It has an ambitious five-year plan for 1985-9, during which it hopes to invest \$7.4 billion of its own money in projects and to act as catalyst for over \$25 billion from other investors and lenders.

In addition to its traditional function of promoting private direct investment, preferably in the form of joint ventures between local and foreign investors, the IFC has become very active in promoting the flow of foreign portfolio investment to the Third World. In portfolio investment, investors purchase non-controlling shares of Third World corporations, often in the form of stock market mutual funds.

One recent IFC operation was the underwriting of the Korea Fund, under which large institutional investors in industrial countries can purchase shares of South Korean companies. Negotiations are under way for similar funds for Brazil and Thailand, with India a possible future candidate. Another type of fund, the Emerging Markets Growth Fund, will invest funds from Europe, Asia, and the US in stocks listed on stock exchanges of several different Asian and Latin American countries.

This growth in portfolio sales to institutional investors may be the big news of the 1980s. It is estimated that US investors now own \$16 billion in foreign stocks, up from \$3 billion only five years ago. Although only a fraction of these are in Third World stocks, the IFC is working hard to open up markets such as that in Korea which are otherwise closed to foreign investors.

If the debt crisis persists, however, these investors may find that this is just another way to lose money. Third World stock exchanges are

notoriously volatile and scandal-prone. The commercial bankers have long cast hungry eyes on the huge amounts of money owned by US pension funds and insurance companies; now, with the assistance of the World Bank, they are beginning to tap these funds.

The IFC is perfectly conscious that they are helping to bail out the banks. According to an internal document of the corporation obtained by a journalist, 'It may be possible to convert some bank claims on LDCs into obligations in investment trusts which could be traded abroad. If this can be done, foreign banks may be able to encash or liquefy loan positions while the debtor country converts an external debt obligation into a long-term marketable foreign claim.' The paper pointed out that commercial banks represent only 35 per cent of national-savings flows in developed countries, whereas institutional investors absorb a further 30-40 per cent of savings, 'all of which are available for long-term investment'.²⁰

As portfolio investment rises, direct foreign investment has declined from an average of \$11.6 billion per year in 1979-82 to \$9.1 billion in 1984. The IFC itself has suffered from 'deterioration in the condition' of its portfolio in the wake of the debt crisis.²¹ As Clausen observed in a speech last year, 'factors inhibiting commercial lending usually inhibit direct investments too'.²²

The 'Baker initiative'

The 'Baker initiative' of September-October 1985 had two prongs. The first was aimed at the African debt crisis, the second at Latin America.

The African countries that were threatening to default on some \$7 billion in repayments to the IMF were not large borrowers from the banks. They had become indebted through borrowing on concessional terms from official creditors, and would have to be rescued by concessional official finance. For these countries Baker proposed a joint World Bank-IMF lending pool totalling \$5 billion. The proposal suggested that \$2.7 billion worth of repayments due to the IMF's Trust Fund should be channelled to countries in difficulty, and that the Fund and the Bank should cooperate in enforcing conditionality on these countries.

²⁰ Anthony Rowley, 'Stretching Maturities', *Far Eastern Economic Review*, 27 September 1984, p. 86.

²¹ International Finance Corporation, *Annual Report 1985*, p. 4.

²² A W Clausen, 'Promoting the private sector in developing countries', Address to the Institute of Directors, London, 26 February 1985.

When the IMF interim committee met in Seoul, it endorsed the idea of devoting the Trust Fund money to a special fund for Africa, but refused to agree to joint IMF-Bank operations and conditionality. It is not yet clear where the rest of the money will come from to make up the total of \$5 billion, or how this fund will be related to the Africa fund already established by the Bank. The IMF has to help bail *itself* out this time, although it is also not clear how \$2.7 or even \$5 billion will serve to bail out countries which owe a total of \$7 billion to the fund.

The second prong of the Baker strategy is designed for Latin America and five other countries which are heavily indebted to commercial banks. According to the proposal, the private banks are to put up \$20 billion in new money over the next three years while the World Bank and the Inter-American Development Bank will accelerate their disbursements and concentrate them in high conditionality programme lending to the designated countries, for an additional amount of \$9 billion in the same period.

The abrupt turn-around in the US attitude toward the World Bank was rich in irony. At the time of the Seoul meeting, the US had not yet voted in favour of the IFC's capital increase, nor had it contributed to the IDA's Special Facility for sub-Saharan Africa which began operations in July 1985 with funds of only \$255 million. After years of turning a cold shoulder to Clausen's pleas for more funds and making it clear that he would not be reappointed when his term as president expires in June 1986, the Reagan administration suddenly grabbed most of his blueprints and began to exalt the role of an institution with a lame-duck executive.

Despite assurances that the Baker proposal did not intend to down-grade the role of the IMF, that is exactly what it was doing, for two good reasons. The first is that the Fund itself is running out of money, as explained above. The second reason is that the Fund is inextricably identified with painful 'austerity' programmes that are no longer acceptable, nor even very effective in the few countries (such as Jamaica) where they are sincerely applied.

By comparison with the IMF, the World Bank's overall net transfers are still respectively positive: for the IBRD, disbursements minus repayments minus interest and fees left a net transfer of \$2.4 billion in the fiscal year 1985. IDA disbursements, although slightly lower than the two previous years, were nearly \$2.5 billion and reverse flows were negligible (see Table 1). With stepped-up disbursements and a general capital increase in the near future, gross disbursements could keep

ahead of the repayment and interest flow for several more years. And the Baker plan would lift the previous limits (10 per cent of total lending) for policy-linked quick-disbursing programme loans such as the SALs and the sector policy loans.

But the Bank itself is not immune to the same repayment problems suffered by commercial banks and the IMF, although it likes to pretend it is. This year, for the first time in its history, the Bank admitted it had a non-accruing loan, defined as one on which interest payments were more than six months late. (The IDA had already admitted,²³ that Chad had been in arrears for more than four years on an IDA credit, so this was a 'first' only for the IBRD.)

Political reasons certainly explain why Nicaragua²⁴ was nearly nine million dollars in arrears on its World Bank repayments—the Reagan administration has made it clear that the Sandinistas will receive no new loans from the Bank—and political hostility probably explains why the loan was placed in non-accrual status, when past arrears have been quietly covered up.²⁵ Payments from countries other than Nicaragua which were overdue more than three months amounted to \$2.46 million at 30 June 1985, a very small amount relative to the total portfolio, but much larger than the \$352,000 reported at the end of the previous fiscal year.²⁶

In the current debt situation, the Bank's announced policy of never rescheduling a loan seems unrealistic rather than reassuring. Like the commercial banks, the World Bank keeps payments current by lending new money to errant debtors (except Nicaragua).

The World Bank does have funds to lend, but there is another reason it has been wheeled on stage to replace the IMF. The debtor countries are tired of austerity and want to get back to growth. The Reagan administration is trying to co-opt this bandwagon. 'Growth' has replaced austerity as the new buzzword. George Shultz, the US Secretary of State, told a Brazilian journalist who approached him after

a speech at the UN, 'Take this down carefully. We support economic growth.'²⁷

Reading between the lines of explanations by US Treasury officials, in which the thought is frequently expressed that countries must have 'hope' and must be able to see 'light at the end of the tunnel', the suspicion grows that the World Bank's traditional association with 'development' is being exploited as a sugar-coating to make present austerity palatable.

This is precisely how the World Bank was used in the economic restructuring of the Philippines economy, according to Robin Broad's analysis. 'The IMF had failed in its attempt to sell a similar package,' she wrote, 'in part because it could not shake its image as purveyor of austerity and social upheaval.' The Bank, on the other hand, 'was aided by its more benevolent image as a bestower of funds for long-term development projects. Clothed in this benevolence, the World Bank was able to act out the short-term stabilization role of the IMF.'²⁸

Substantively the Baker plan contains very little that is really new. It proposes that everyone continue doing what they were supposed to have been doing anyway: the countries are to obey conditions laid down by the Fund and the Bank, the commercial banks are to lend more to countries they now *know* are bad risks, and the US government will, maybe, cough up some more funds sometime in the future. If the formula hasn't worked before, why should it work now?

The additional money, if any, which the plan will mobilise will not but much compliance, or growth. The \$29 billion envisioned in the Baker plan should be compared with the interest bill of \$135 billion which the fifteen selected debtor countries will have to pay over the same three years.²⁹ The US Congress may be even less willing to approve a capital increase for the World Bank than they were to vote a similar increase for the IMF which barely squeaked through in 1983, but without the capital increase the Bank will soon find itself in the same trouble the IMF is in now.

The Baker plan is an act of desperation, not a viable blueprint for solving the debt crisis. The US government is playing poker with an empty hand, while pressuring the banks to throw good money after bad

²⁷ Alan Riding, 'US shift on Latin debt seen as a turning point in crisis', *New York Times*, 3 October 1985.

²⁹ Estimate by Albert Fishlow, quoted in the *Wall Street Journal*, 20 November 1985.

in a last-ditch attempt to purchase conditionality and prevent independent decision-making in the debtor countries. But things are falling apart fast, and the next few years should be extremely interesting.

THE UN SYSTEM

▲Treaty on the Non-Proliferation of Nuclear Weapons (NPT)
Third Review Conference of the States Parties
Geneva, 27 August-21 September 1985

■Eighty-six of the 130 parties to the 1968 NPT attended the quinquennial conference to review its operation fifteen years after it entered into force in 1970. Also present were the three signatory states which had not ratified the treaty, ten observer states and forty-eight representatives of non-governmental organisations. The Third Review Conference adopted by consensus a Final Declaration affirming support for the NPT,¹ after compromises had been reached on the best immediate means of furthering disarmament by nuclear weapon states, and on other controversial issues.

The main issue under review was the compliance of the nuclear weapon states (US, USSR, and Britain - France and China are not parties) with their obligations under Article VI of the Treaty. In obliging state parties to prevent the spread of nuclear weapons, the NPT imposes distinct obligations on nuclear and non-nuclear weapon states. Non-nuclear weapon states renounce the option of acquiring or manufacturing nuclear weapons, allowing on-site inspection of their civil nuclear facilities. Nuclear weapon states, meanwhile, agree to share nuclear technology for peaceful purposes, accepting safeguards in its transference, and by Article VI are bound to take steps in good faith towards disarmament, and the halting of the arms race. In an opening statement to the conference, the UN Secretary-General, Javier Perez de Cuellar, remarked that while the Treaty had been relatively successful in preventing nuclear proliferation among its parties (none were known to have developed nuclear weapons, or withdrawn from the treaty²) the failure of the three nuclear weapon states parties to pursue disarmament was a growing source of dissatisfaction among the other parties.³ Disagreements over the application of Article VI had in fact been largely responsible for the failure of the first and second review conferences to issue a declaration, and threaten to jeopardise the renewal of the treaty when it expires in 1995.

In its Final Declaration, the Conference noted that the nuclear arsenals of the nuclear weapon states parties were being developed rather than diminished. It noted concerns expressed at the conference over the possible extension of the arms race into space. The conference concluded that no effective arms control agreement had been reached in the past five years, and it called for a renewed commitment by the US, the USSR and Britain to the implementation of Article VI. Controversy centred, however, on the best means of demonstrating this commitment. Alfonso Garcia Robles, the Mexican delegate, on behalf of the neutral and non-aligned states, tabled three resolutions, calling for: the nuclear weapons states to negotiate a Comprehensive Nuclear Test Ban Treaty (CTBT); an immediate interim moratorium on nuclear testing; and a nuclear-arms freeze on testing, production and deployment, coupled with negotiations to reduce existing stockpiles. A CTBT had been urged by the same countries at the previous NPT Review Conferences, but the Partial Test Ban Treaty of 1963, banning tests in the sea, in space and in the

North-South Monitor

atmosphere, had never been followed by a complete ban. Negotiations begun between the US, the Soviet Union and Britain in 1977 had been suspended in 1980, and in 1982 President Reagan had declined to resume them, on the basis that a CTBT would be unverifiable.

Andrei M Petrosyantz, the Soviet representative, expressed support for a CTBT as a top priority for disarmament. A message to the conference from Mikhail Gorbachev furthermore repeated an appeal to the US to join the Soviet Union in its unilateral moratorium on nuclear tests, which had begun on 6 August 1985, and was due to end on 31 December 1985, unless matched by the US.⁴ A CTBT was also supported by the Australian Foreign Minister, Bill Hayden, and the West German representative, Jürgen Möllemann, who argued that its signatories should establish a global system of seismological verification. The resolutions were, however, opposed by the US and Britain. The US representative, Kenneth Adelman, argued that the US was committed to a CTBT as a long-term goal, but not as a first step to reducing the nuclear threat. In a message to the conference, President Reagan, who had refused the Soviet appeal for a test moratorium on the basis that it was unverifiable, argued that avoidance of nuclear war was best sought through the Geneva arms talks, and the US proposals tabled there. Appealing to the Soviet Union for mutual radical cuts in their nuclear arsenals, he said that verifiable limits on nuclear testing could play a 'useful though more modest role'. Richard Luce, a British Foreign Minister, supported the US in arguing that the priority for disarmament was arms reduction between the US and the Soviet Union. He expressed limited support for a CTBT, however, arguing for the exertion of political will to overcome what he considered to be very real problems of verification.

The Mexican proponent of the resolutions had called for them to be put to the vote, but a compromise wording was arrived at instead. The Final Declaration expressed the view that 'a Treaty banning all nuclear weapon tests was one of the most important measures to halt the nuclear arms race.' The conference, 'except for certain states', called on the nuclear weapons states to resume trilateral negotiations towards a CTBT in 1985, while those 'certain states' considered 'deep and verifiable reductions in existing arsenals of nuclear weapons as the highest priority'. Note was taken of the willingness expressed by the Soviet Union to begin CTBT negotiations. The Declaration omitted demands for an interim moratorium and a nuclear-arms freeze.

The conference expressed strong support for the nuclear 'safeguards' system entailing inspection of civil nuclear facilities by the International Atomic Energy Agency (IAEA). It compromised, however, on a proposed requirement that full-scope safeguards should be applied in exporting nuclear materials to non-parties to the NPT, thus ending partial safeguards on the material, and discrimination against NPT parties. Though supported by most Western and some socialist countries, the measure was opposed by Switzerland and West Germany, both nuclear suppliers. The Swiss representative argued that the imposition of full safeguards on non-parties would simply reduce the influence of the supplier countries, by leading recipients to obtain supplies elsewhere, or develop their indigenous industries. The Final Declaration merely urged non-parties to accept full-scope safeguards voluntarily.

The conference also noted concerns about the nuclear capability of Israel and

North-South Monitor

South Africa, registering calls to halt the transfer of nuclear technology to these countries. An attempt by Iran to include a condemnation of Iraqi attacks on its nuclear reactor at Bushehr failed, however, and references to both this attack, and an Israeli raid on the Iraqi reactor in 1981, were deleted. The Declaration merely stated that 'an armed attack on a safeguarded nuclear facility, or threat of attack, would create a situation in which the Security Council would have to act immediately.' The conference also endorsed the establishment of the South Pacific Nuclear Free Zone in August 1985,⁵ and decided that such zones should be encouraged as a means to disarmament. Finally, it made a plea for further ratification of the NPT, which six of the 'near-nuclear' states (Argentina, Brazil, India, Pakistan, Israel and South Africa) have never ratified.⁶

The next meeting of the Review Conference will be held in 1990.

● The Treaty is not a one-way street . . . the implementation of the Treaty has been largely one-sided, to the understandable concern and profound dissatisfaction of its non-nuclear weapon parties. There must be recognition of the fact that restraint on one side cannot reasonably be demanded in the face of unlimited expansion on the other.' UN Secretary-General, Javier Pérez de Cuellar, speaking of the non-implementation of Article VI. *Disarmament Newsletter* (New York) October 1985. 'There should be no doubt that a mutual USSR US moratorium on nuclear explosions would create favourable conditions for concluding an international treaty on complete and general prohibition of nuclear weapon tests and would contribute to a fuller implementation of the provisions of the Treaty.' Andrei M Petrosyantz, Soviet representative at the conference and Chairman of the Soviet Union's State Committee for the Uses of Atomic Energy. *UN Weekly Summary* WS/85/32, 5 September 1985.

'We remain committed to a complete ban on nuclear testing as a long-term goal . . . our most urgent task must be deep reductions of those existing nuclear arsenals.' Kenneth Adelman, US representative at the conference, and Director of the US Arms Control and Disarmament Agency. *The Times* (London) 29 August 1985. 'We firmly believe nuclear disarmament must begin with effective bilateral negotiations between the US and the USSR, who between them possess 95 per cent of the world's nuclear weapons.' Richard Luce, British representative at the conference. *The Times* (London) 30 August 1985.

▲ International Fund for Agricultural Development (IFAD)

Executive Board, 25th session
Rome, 3-6 September 1985

■ Prospects for IFAD's second budget replenishment were reported to have improved following formal and informal discussions at a meeting of the Executive Board. Negotiations on funding had been deadlocked since February 1985 over the proportions to be contributed by OPEC and OECD countries, with the US objecting to a 2 per cent reduction in OPEC's 42 per cent share which its members were seeking.⁷ While the reasons for optimism were not made public, IFAD's President

North-South Monitor

Idriss Jazairy was preparing to reconvene consultations with IFAD member-states in the expectation of a swift solution to the problem.

During the meeting the board approved a total of \$48.8m in loans to seven projects aimed at increasing the food production of small farmers in developing countries. The loans were to be supplemented by other resources from financial institutions and recipient countries to cover the total cost of the projects of \$174.6m. Also approved were a second grant of \$1.5m to the OAU's Scientific Technical and Research Commission for an agricultural management training programme for Africa, a programme of work for 1986 and 168m SDR (\$173.9m) and a zero-growth administrative budget of \$26.2m which was transmitted to the Governing Council for final approval.

The board reviewed a progress report on IFAD's Special Programme for 23 sub-Saharan African countries severely affected by drought and desertification. The programme had been launched by a special session of the board in May 1985⁶ with a target fund of \$300m for the ensuing four years. It was said to have received encouraging offers of government funding."

▲ UNCTAD Trade and Development Board (TDB)

Thirty-first Session

Geneva, 16-27 September 1985

■ The 128-member TDB continued its discussions on the interdependence of problems of trade, development finance and the international monetary system, together with the debt and development problems of developing countries. In the absence of agreed conclusions, a summary and conclusions of the debate were drawn up by Martin Huslid, the Norwegian President of the Board, on his own initiative. The final plenary session formally declined to endorse the President's summary, but agreed to annex it to a report of the session.

The TDB based its discussions on the UNCTAD Trade and Development Report 1985, and was addressed in the opening session by Alistair McIntyre, in his capacity as Deputy Secretary-General and Officer-in-Charge of UNCTAD, who highlighted some of its conclusions. The report warned that the efforts of debtor developing countries to service their debts by generating large trade surpluses were frustrating their hopes for economic development. These efforts were, moreover, unsustainable in the face of faltering recovery in the developed world, high interest rates, growing protectionism and a decline in bank lending to indebted countries. Alistair McIntyre warned that the 1980s could become a 'lost decade' for development unless efforts were made to reverse these trends.

In the debate itself, Benson O Tonwe of Nigeria, speaking on behalf of the Group of 77 (G77), commended the UNCTAD Report's analysis of the debt and development crisis. He argued that the crisis was being sustained by a number of devices applied by the main industrialised market-economy countries, including high interest rates; large trade deficits; protectionist measures against developing country exports; restrictive export credit policies; and the conditionality imposed upon loans by the International Monetary Fund. Condemning the vicious circle whereby lower

North-South Monitor

commodity prices were negating efforts to increase exports at a time when increased export revenues were needed to service debts, he said that net financial outflows representing 25 to 50 per cent of total exports could not be sustained by developing countries 'without disruptive consequences for their political structures and for the world's financial houses on which the present lopsided international economic order is built.' Kazimir Vidas of Yugoslavia, also speaking for the G77, added that the policies of the industrialised countries made the adjustment efforts of developing countries ineffective, and he urged that the principle of co-responsibility between debtor and creditor countries be recognised. It should also be acknowledged, he said, that growth in debtor developing countries was a precondition for debt servicing, and that a country's debt service repayments should be limited to a proportion of its export earnings.

Speaking for the OECD countries, Pierre-Louis Girard of Switzerland disputed the pessimism of some of the UNCTAD Report's conclusions, commending the role of the IMF in managing indebtedness in developing countries, and citing positive efforts to halt protectionism. Together with Jean Louis Wolzfeld of Luxembourg, who spoke on behalf of the EEC, he advocated improved macroeconomic coordination between the industrialised countries as a way to redress imbalances restricting global recovery. Bernard Engel of the US rejected the idea of generalised solutions to the debt problem, attributing debt servicing problems to inappropriate domestic and external borrowing policies on the part of some developing countries. In opposition to the contention of the G77 that developing countries had reached the limits of austerity, and were dependent on the industrialised countries to alter external factors beyond their own control, the US representative insisted that the restoration of creditworthiness depended not on external solutions, but on the adjustment of developing countries' economic policies.

The TDB's President made an attempt to summarise the convergence of views within the discussion. He cited a 'generally recognised need for broad coordinated action to promote economic growth and development', and warned that the current transfer of resources from developing to industrialised countries 'endangers their political and social stability and is not tenable over a longer period.' He identified general support for the need of developing countries to develop their economies in such a way as to respond both to 'development priorities and growth opportunities', and for greater efforts from industrialised countries to foster a favourable environment for economic development, through such measures as increased ODA; increased capital and private financial flows; a reduction in interest rates; better aligned exchange rates; decreased protectionism; and consultations towards strengthening commodity markets.

The TDB also adopted two resolutions on technology: one concerning the technological transformation of developing countries in the pharmaceutical sector and the other requesting the examination by a group of intergovernmental experts of the transfer, application and development of technology in the energy sector. The Board also reiterated the need to implement previous resolutions on trade among countries with different economic and social systems, and adopted a resolution urging the international community to recognise the needs and problems of land-locked developing countries, particularly in the fields of cross-border transport and services.¹⁰

North-South Monitor

● 'Should the superstructure collapse, the effects, like those of a nuclear war, would be devastating for everyone, the rich like the poor, the borrower like the lender.' Benson O Towne, speaking on behalf of the G77, on the precariousness of the current international financial situation.

'There is in fact evidence of a widening of the recovery and the prospects for sustained growth with lower inflation look good.' Bernard Engel, US representative, disagreeing with UNCTAD's pessimistic outlook for developing countries. *UNCTAD Bulletin* (Geneva) October 1985.

▲ UN General Assembly (UNGA)

Fortieth Session: fortieth anniversary commemoration

New York, 23 September–24 October 1985

■ The UNGA's fortieth session included three weeks of general debate from 23 September–11 October 1985, and a special commemorative session from 14–24 October 1985, which ended on the fortieth anniversary of the UN Charter's entry into force.

The special commemorative session was attended by representatives of the UN's 159 members, together with observers. (A draft resolution, tabled by India and five other non-aligned countries, to invite Yasser Arafat, the leader of the Palestine Liberation Organisation (PLO) and Sam Nujoma, the President of the South West Africa People's Organisation (SWAPO) had been withdrawn following a threat by President Reagan to boycott the session if a PLO representative was present.¹¹) One hundred and twenty speakers, including thirty-five Heads of State, eight Vice-Presidents, thirty-three Prime Ministers and forty-three special envoys attended the commemoration ceremony. It culminated in speeches on 24 October 1985 by representatives of the five permanent members of the Security Council (Britain, China, France, Soviet Union and US) together with the Prime Minister of India, as a representative of the Third World. Speeches given in the general debate and the special ceremony touched upon the whole range of issues with which the UN and the international community are concerned. Salient among these issues were debt, nuclear and space weapons and the forthcoming superpower summit in Geneva in November 1985, Southern Africa and the Middle East.

A plan to publicise the problem of Latin America's US\$360bn foreign debt from the platform of the UNGA had apparently been formed at the inauguration of Peruvian President Alan García Pérez in Lima, in July 1985. Mexico's President Miguel de la Madrid was, however, obliged to cancel his scheduled keynote address to the UNGA owing to the earthquake in Mexico City in September 1985. Instead, President José Sarney of Brazil delivered the first speech in the UNGA's annual general debate. As the leader of Latin America's largest debtor country, President Sarney focused on the economic problems of the region, and the cost of servicing foreign debts. He criticised international financial institutions, such as the International Monetary Fund (IMF), for prescribing inadequate adjustment policies, designed to generate trade surpluses to cover interest payments, which led, he maintained, to recession, unemployment and the relinquishing of the capacity to

North-South Monitor

grow. These factors in turn jeopardised the social order and democratic structures. These domestic problems were, he added, compounded by international factors such as high interest rates, low commodity prices and protectionist barriers in industrialised countries against the exports of debtor countries. While disclaiming any wish to make debt an ideological issue or a matter for East-West or North-South confrontation, President Sarney urged reassessment of the problem, on the basis that the situation was unjust.

The Peruvian President, Alan García, also speaking on 23 September, denounced the IMF in stronger terms, as lacking the moral authority to 'preach austerity'. He warned that Peru would withdraw from the IMF unless the international monetary system was reformed, Peru's \$14bn debt was eased and international liquidity was 'fairly' distributed. He also reiterated Peru's stance of rejecting the IMF as an intermediary between Peru and its creditor countries.

The issue of the Third World's economic problems was, however, to an extent eclipsed in the debates by concern with East-West tensions and rivalry in the approach to the Gorbachev-Reagan summit in Geneva. On 24 September 1985, the US Secretary of State, George Shultz, had sought the UNGA's support for the US Strategic Defence Initiative (SDI). He had argued that deterrence would persist once space weapons were in place, but that it would operate by denying the prospect of successful attack to a potential aggressor, rather than by threatening mutual destruction through massive retaliation.¹² The Soviet Foreign Minister, Eduard Shevardnadze, had in turn rejected the concept of 'Star Wars', advocating instead his own concept of 'Star Peace', whereby the international community would cooperate to ensure the non-military use of outer space.¹³ Other speakers, including representatives of US allies, added their voices to that of Eduard Shevardnadze in questioning the validity of SDI. On 26 September 1985 the French Minister for External Relations, Roland Dumas, called for a ban by the superpowers on anti-missile and anti-satellite weapons, as well as appealing for substantial cuts in US and Soviet offensive nuclear forces. In his later address to the commemorative session on 24 October, Dumas added that France was determined to maintain its own independent nuclear defences until the superpowers gave a lead towards nuclear disarmament. Notwithstanding opposition from Bill Hayden, the Australian Foreign Minister, he confirmed that France would continue its programme of nuclear testing in the Pacific.

The Prime Minister of India, Rajiv Gandhi, continued the preoccupation with nuclear weapons in his address to the commemorative session. Denying that strategic superiority or even balance could bring peace, he advocated stability through coexistence and disarmament, commending the disarmament plan contained in the Delhi Declaration, known as the Five Continents Peace Initiative.¹⁴

In his own commemorative address on 24 October 1985, President Reagan departed from the theme of nuclear arms control, in what was seen as an attempt to redefine the agenda and priorities of the Geneva Summit. He challenged the Soviet Union to stop using 'military force and subversion to expand its global influence', suggesting a three-point plan to resolve conflicts in five regions: Ethiopia, Angola, Afghanistan, Cambodia and Nicaragua. The warring parties in the disputes would conduct negotiations, supported by separate talks between the superpowers, with the objective of securing the withdrawal of foreign troops and military advisers from the

North-South Monitor

regions, and restricting the influx of outside arms. The plan then provided for generous US aid in the reintegration of these countries into the world economy. The US would meanwhile continue to support anti-communist guerrilla movements around the world until progress was made towards negotiated solutions.¹⁵ Eduard Shevardnadze followed President Reagan's address with a speech which made no direct response to the regional conflicts initiative. He did, however, denounce US-backed guerrillas in Nicaragua and Afghanistan as 'hired assassins', advocating the UN as the forum in which to resolve such conflicts. He moreover mentioned the Middle East and South Africa as areas of regional conflict conspicuously absent from President Reagan's catalogue.

Southern Africa featured prominently in the speeches of African leaders, many of whom warned of an impending conflagration in South Africa unless economic sanctions were applied to hasten the dismantling of apartheid. President Kenneth Kaunda of Zambia expressed disappointment over the inadequacy of the measures consented to by Britain at the Commonwealth Heads of Government Meeting in October 1985. Zimbabwe's Foreign Minister, Witness Mangwende, informed the UNGA that his country was prepared to accept the consequences of South Africa's reprisals for the mandatory application of economic sanctions. In a further African development during the session, the Moroccan Prime Minister, Mohamed Karim Lamrani, read out a message from King Hassan II. It offered an immediate ceasefire in Western Sahara and a UN-supervised referendum in January 1986, to allow the inhabitants of Western Sahara to decide their own fate.

The Middle East issue surfaced in several forms during the course of the session. On 16 October 1985, the UNGA rejected an attempt backed by all the Arab states except Egypt, Jordan and Oman, and by the socialist states, to expel Israel from the Assembly. The move was defeated by forty-one votes to eighty, with twenty abstentions. On 21 October 1985, Israel's Prime Minister, Shimon Peres, offered an end to the state of war with Jordan, proposing the UN as an international forum for the launching of a peace process. He urged the UN to initiate direct talks between Israel and Jordan before the end of 1985, with the object of reaching peace treaties between Israel and the Arab states, and resolving the Palestinian issue. He also advocated a new demarcation of boundaries. He did not explicitly rule out PLO participation in the talks, which was an essential prerequisite for King Hussein of Jordan, but asked for 'men of peace not violence'. A Middle East issue, however, proved the chief obstacle to the adoption of an anniversary declaration expressing the UN's purposes, which a special committee had been drafting for a year. Arab countries, with the support of the Non-Aligned Movement, had called for the inclusion of an appeal for Israel's withdrawal from the occupied territories, while the US had proposed a more general reaffirmation of the UN's commitment towards a comprehensive settlement in the Middle East. The difference blocked agreement on the declaration, which was abandoned.

Notwithstanding this demonstration of UN paralysis, the session was characterised by general recognition of the value of the organisation, particularly for the small and weak states among its members, for whom the UN Charter was seen to provide essential protection. The commemorative session ended with the UNGA's proclamation of 1986 as the International Year of Peace, a resolution sponsored by fifty-two states, and passed by consensus.¹⁶

North-South Monitor

● 'Brazil will not pay its foreign debt with recession nor with unemployment, nor with hunger. We believe that in settling this account, at such high social cost, we would then have to surrender our freedom, for a debt paid for with poverty is an account paid for with democracy.' President José Sarney of Brazil, in his speech to the UNGA. *Brazilian Mission to the UN*, Address by José Sarney, 23 September 1985.

'A catastrophic explosion which will engulf all of us in the region is imminent . . . If you don't apply sanctions, hundreds of thousands of people will die and the investments will go up in flames. With sanctions there is a possibility of recovery.' President Kenneth Kaunda of Zambia advocating sanctions against South Africa, in his speech to the UNGA. *IHT* (Paris) 24 October 1985.

'The meetings were marred by North-South tensions, and in particular, by the Middle Eastern questions . . . A number of nations used the declaration as a point-scoring exercise.' Harry Feldman, US delegate on the declaration drafting committee, which failed to reach agreement. *IHT* (Paris) 26-7 October 1985.

'Certain countries are not willing to work together to produce a result which is acceptable to everyone.' Rajiv Gandhi, Prime Minister of India, commenting on the failure of the US to agree with the other countries over the final anniversary declaration. *IHT* (Paris) 26-7 October 1985.

▲ UNESCO Executive Board

122nd session

Paris, 11-28 September 1985 and Sofia, 8 October-8 November 1985

UNESCO General Conference

23rd session

Sofia, 8 October-9 November 1985

■ One hundred and fifty-two of UNESCO's 160 member-countries were represented at the biennial conference, which met to assess reforms proposed over the past eighteen months, and to consider a draft programme and budget for 1986-7. The conference, taking place on the fortieth anniversary of the founding of UNESCO, was widely considered to be crucial to the organisation's future. It was the first session since the US withdrawal at the end of 1984, and was overshadowed by the threat of other countries, particularly Britain, following suit.

The meeting opened with an appeal from the outgoing conference Chairman, Said Tell of Jordan, for the US to reconsider its withdrawal, and to return to the organisation as soon as possible. The British Minister for Overseas Development, Timothy Raison, confirmed in a speech that Britain, which had given its notice to withdraw on 5 December 1984, would leave at the end of 1985, unless more thorough and comprehensive reforms were implemented. Among these he included the conducting of fewer abstract studies; more decentralised activity in the field, at the expense of work in the Paris headquarters; less political bias; less duplication with other UN agencies; and the creation of a permanent mechanism for member-countries to monitor the Secretariat when the biannual Executive Board was not in session. Singapore, like Britain, had earlier given its notice to withdraw, and other

North-South Monitor

members known to be reconsidering their position in the organisation were Japan, West Germany, Denmark, the Netherlands, Canada and Iceland.

The conference considered various precedural problems raised by the US withdrawal. It heard a call by the Soviet Union, supported by countries including Algeria, India and the Cameroon, for US nationals employed by UNESCO to be dismissed first as part of the staff cuts made necessary by the loss of the US's 25 per cent budget contribution. During the preceding Executive Board meeting in Paris, UNESCO's Director-General, Amadou Mahtar M'Bow, had warned that as many as 570 posts would be lost, together with the 100 frozen earlier, at a total saving of \$45m. He had also, however, argued against subjecting the US members of the international staff to discrimination in job losses. The conference unanimously decided that the 129 existing US staff at the UNESCO headquarters would not automatically lose their jobs, but that withdrawing states would forfeit their quota posts in the Secretariat in the future. The conference heard objections to the US's assumption of observer status since its withdrawal. It decided that the Executive Board should be empowered to consider each application for observer status on its merits, though there would be reciprocal conditions attached to the observer and to UNESCO. An unsuccessful move was led by Algeria to take the US to the International Court of Justice for a decision on its financial obligations to UNESCO, since it had withheld the remainder of its contribution for the 1984-5 biennium. A compromise wording of the proposed resolution, drafted by Algeria and Canada, merely requested that the executive discuss with the US its outstanding annual contribution of \$43m, and rule on future cases of mid-term withdrawal, and was agreed by consensus.

The conference, in an unusual show of unanimity, agreed by consensus the programme and budget, drafted by the Director-General. It adopted a provisional, zero-growth budget ceiling of \$398m for the biennium 1986/7, which would amount to \$307m after the 25 per cent US shortfall was taken into account. As recommended by the previous Executive Board session,¹⁷ programme cuts were to be made, ensuring that, as Britain had insisted, members incurred no extra costs as a result of US withdrawal. Fourteen major programmes for the biennium were approved, giving top priority to educational activities, and a drive to end illiteracy by the end of the century. Scientific activities, such as the training of professional personnel, and cultural activities in the field of protecting historical monuments and preserving cultural distinctness were also emphasised. Programme 13, on peace and disarmament, which was opposed by Britain, was amended to preclude its covering technical aspects of the subject, considered more appropriate to other agencies. The controversial programme on the New World Information Order was formally approved, though without emphasis or the suggestion of urgency. Other comments were made on such subjects as world peace, racism and apartheid; a distinction was adopted, with Britain's approval, between human rights and people's rights; and of the hundred or so resolutions passed by the conference, all but two (concerning Jerusalem and the Arab occupied territories) were adopted by consensus.

West Germany and Japan were among other countries reported to have expressed their satisfaction over the extent of the reforms initiated. Doubt still remained, however, as to the British assessment, despite the contention of many UNESCO members that they had achieved a high degree of consensus, and accommodated

North-South Monitor

British demands to an unprecedented extent. The British representative confirmed that a decision would be taken in December on Britain's membership.¹⁸ The Soviet Union, meanwhile, surprised the conference by making it known that it was seeking the return of the US to the organisation for 'political' as well as financial reasons. Its representatives, and those of other socialist countries, were reported to be considering withholding their support from Amadou M'Bow, should he seek a third term when his present term as Director-General expired at the end of 1987, if his departure could secure a US return.¹⁹

The Executive Board meeting, which had begun in Paris and continued alongside the conference in Sofia, decided to establish a mechanism to follow the implementation of the reforms approved by the Board. The monitoring body was to be the Board's Special Committee, composed of eighteen members. It was made clear, however, that the Committee would not perform a supervisory role as regards the Director-General or the Secretariat. The fifty-one member Board, twenty-six of whose members has ended their four-year mandate and seen their replacements elected by the conference, also adopted the Board's 1986-7 work programme.²⁰

The next UNESCO conference was scheduled for 1987, in Paris.

● 'UNESCO has proved here that at a point when some predicted its death it is in a condition to display goodwill for mutual understanding and a desire for steady improvement.' Amadou Mahtar M'Bow, Director-General of UNESCO, to the conference. *Xinhua News Agency* 11 November 1985.

The Algerian and Canadian compromise resolution on the financial obligations of the US was 'the climax of almost a year of debate, the healing of old wounds, and the turning of our faces to the future'. David Wilson, the Canadian delegate. *The Guardian* (London) 5 November 1985.

'We insist on thoroughgoing and comprehensive reform. Without it our intention to withdraw will be confirmed.' Timothy Raison, British Minister for Overseas Development, in his speech to the conference. *IHT* (Paris) 15 October 1985.

'The organisation cannot live in a permanent climate of reform proposals.' Gisèle Halimi, the French delegate, making clear that the Executive Board's Special Committee was not empowered to make reform proposals on its own initiative. *UN Press Release* UNESCO/2513, 6 November 1985.

▲ Food and Agriculture Organisation (FAO)

Conference of Agriculture Ministers: 23rd Session
Rome, 9-28 November 1985

■ Dubbed a 'world food summit' by FAO, the biennial conference of FAO's supreme government body was attended by ministers or their representatives from the 156 member-countries. They reviewed the global food and agriculture situation over the previous two years and considered a draft programme and budget for the next biennium, drawn up by the FAO Director-General, Edouard Saouma. On 14 November a special ceremony was held to mark the FAO's fortieth anniversary, at which the conference was addressed by the Indonesian President, General Suharto, and the French President, François Mitterrand.

North-South Monitor

In his opening speech, Edouard Saouma said that the past two years had been a good period for the majority of the world's farmers, fishermen and foresters but that Africa had suffered crippling drought and famine. He announced that the most acute famine was now over in all but five of the twenty-one drought-affected countries of Africa: Angola, Botswana, Ethiopia, Mozambique and Sudan. The emergency had receded due to a dramatic increase in food production in the eight semi-arid countries bordering the Sahara²¹ but he emphasised that these countries still remained heavily dependent on imports to meet structural food shortages. Despite the worst of the drought having ended, Africa was to remain the FAO's regional priority. The conference accordingly approved a report on the critical food situation in Africa in which it was stressed that efforts towards raising agricultural production should be maintained despite the improved 1985 crop and that the long-term problems of population increase and desertification should be addressed. The conference approved the programme and budget for 1986-87 the latter amounting to some US\$448m. Twelve industrialised countries including the US, Japan, Switzerland, the UK and other EEC countries abstained in the vote in protest that their recommendation of a zero-growth budget had not been followed. The new amount represented a 1.14 per cent increase in real terms over the 1984-85 budget of \$421m. However, in practice most countries' contributions would probably have fallen owing to changes in the Lira:Dollar exchange rate. In spite of an earlier cut in the proposed increase in spending from 1.4 to 1.14 per cent in deference to the industrialised countries, and \$4.7m worth of administrative economies to permit a 3.8 per cent growth in the FAO's technical and economic activities, the abstaining countries insisted that the FAO could cut costs still further while maintaining its level of services.

The conference approved a draft World Food Security Compact presented by Edouard Saouma and approved by the FAO Council in June 1985. Although not legally-binding the compact committed governments, non-governmental organisations and individuals to ensuring that everyone always had the means to produce or procure the basic foodstuffs they needed. Guidelines were set out for the achievement of this objective, including suggestions that developing countries should avoid dependence on imports for food supplies to their cities and that developed countries should consider their global responsibilities when formulating policies on food production, storage and exportation. The compact was an attempt to mobilise political and public opinion to urge the eradication of hunger and malnutrition. Addressing the question of world food security at the fortieth anniversary ceremony, the Director-General listed six goals for the FAO in the coming years: eradicating malnutrition and starvation, promoting grain production where grain was scarce, protecting natural resources indispensable to agriculture, forestry and fisheries, strengthening the position of developing countries in world trade, promoting rural reforms and ensuring greater security in world grain production.

Ministers considered a new FAO study on 'Agricultural Price Policies' which examined the price bias against agricultural commodities in developing countries proposing more effective pricing policies for these countries and noting the influence of industrialised countries' policies on the effectiveness of pricing measures in developing countries. They also approved a draft international Code of Conduct on

North-South Monitor

the Distribution and Use of Pesticides. Designed particularly with developing countries lacking controls of their own in mind, this code was the culmination of three years of negotiation and represents the first international attempt to regulate the handling, trade and safe use of pesticides.

The conference tentatively agreed a plan, proposed by developing countries, to establish a new global system for collecting and storing the endangered genetic resources of plants, to be financed by the industrialised countries. The developing countries argued that most of the plant genes which had increased the world's food supply had been found in the Southern hemisphere and that countries there should be compensated for seeds and plants found within their borders but gaining profit for seed companies elsewhere. The US, however, supported in its opposition to the plan by Canada, New Zealand, Australia, Japan and Britain, maintained that the new system would be redundant at best and at worst would result in undesirable restrictions on genetic developments by limiting access to plant material for scientists.

The conference agreed to admit the Cook Islands and the Solomon Islands to membership of the FAO, bringing the total of member-states to 158.²²

● It is important to keep perspectives. The rains have recovered; Africa has not'. Mr Edouard Saouma, FAO Director-General, *Financial Times* (London) 8 November 1985.

Scientists have always had free access to genetic material held by the existing network. We haven't been assured this would happen with a new programme'. Millicent Fenwick, US Ambassador to the conference, *IHT* (Paris) 29 November 1985.

INTERNATIONAL MONETARY FUND (IMF) AND WORLD BANK

▲ Intergovernmental Group of 24 (G24)

Meeting of Deputies

Washington DC, 19–21 August 1985

■ At a specially convened meeting, G24 deputies completed a report on 'The Functioning and Improvement of the International Monetary System'.²³ In contrast to an earlier report of the Group of 10 (G10) industrialised countries, which had concluded that the current international monetary system remained valid and required no major changes,²⁴ the G24 report, while covering broadly the same topics, recommended far-reaching reform.

The report criticised the current system of floating exchange rates as conducive to a high degree of short-term volatility and misalignment of currencies, resulting in uncertainty, reduced trade and investment, and a misallocation of resources. These problems, it said, had particularly harmed the developing countries, adversely affecting their volume of trade, and increasing their need to keep larger reserves. The report recommended the adoption of target zones for the exchange rates of the major currencies; policy coordination among the industrial countries; intervention in the exchange market; and a mechanism to trigger consultations when there was any indication of excessive fluctuations or misalignment of major currencies.

North-South Monitor

The G24 report was critical of the inefficacy of IMF surveillance of the exchange rate policies of the industrialised countries, which it argued were responsible for the disproportionate burden placed on developing countries. It recommended more effective, continuous monitoring, and the application of more pressure on these countries to conform to IMF prescriptions. With regard to the developing countries, the report suggested that IMF policy recommendations should promote 'adjustment consistent with economic development'.

It upheld the confidentiality of consultations between the IMF and member-countries. In a section on debt, the G24 report argued that the problem required 'imaginative solutions involving debt restructuring and relief'. It suggested that industrial countries should discourage the loss of resources from developing countries experiencing serious capital flight problems; that interest rates should be more closely aligned to 'the real cost of funds'; that protectionism in industrialised countries be curbed, and access to developing country exports be improved; and that official capital flows to developing countries be increased. The World Bank was advised not to attach too much importance to policy-based lending, or to increased conditionality criteria in its lending, and greater IMF flexibility in rescheduling was advocated.

The report recommended an increase in international liquidity. It suggested that an annual allocation of at least 15bn Special Drawing Rights (SDRs) should be made, with distribution based on the needs of developing countries. Advocating a general liberalisation of the IMF's programmes and policies, and their more flexible application, it argued for greater voting power for developing countries within the fund. Other recommendations included:

- Extending the compensatory financing facility to cover quantifiable deterioration in terms of trade.
- Establishing a facility to compensate for interest rate increases.
- Reviving the IMF Trust Fund which makes concessional loans to low-income countries.
- Continuing and extending the policy of enlarged access to IMF funds.
- Increasing the resources of international institutions, particularly the World Bank Group.

The report also called for the establishment of a representative committee of ministers from industrialised and developing countries to study both the G24 and G10 reports in depth as a step towards convening an international conference to consider the reform of the international monetary system. Meanwhile, the G24 deputies agreed that the report be transmitted to the IMF Interim Committee, at its forthcoming meeting in Seoul.²⁵

25th Meeting

Seoul, 6–7 October 1985

IMF/World Bank Development Committee

27th Meeting

Seoul, 7 October 1985

40th Annual Joint Meeting of the Boards of Governors

Seoul, 8–10 October 1985

■The dominant themes of the IMF and World Bank annual meetings in Seoul were the furtherance of economic growth in indebted developing countries, and an enhanced role for the World Bank. The focus of the plenary conference, attended by representatives of 149 countries, was a new initiative by US Treasury Secretary, James Baker. The Baker plan, designed to stem the decline in financial flows to debtor countries, was officially unveiled after preliminary meetings of the two IMF and World Bank advisory committees.

Ministerial representatives of developing countries had listed their proposals in a communiqué of the Group of 24 (G24) which had met in Seoul on 5 October 1985.²⁶ Urging reform of the international monetary and financial system, they called for the US fiscal deficit and interest rates to be reduced, and for a curbing of protectionism in developed countries. On the debt problem they advocated a move from 'negative' adjustment towards more 'positive' growth-oriented adjustment, and emphasised the co-responsibility of debtors and creditors. Debt service, they said, should not claim an 'unreasonable proportion' of a debtor's export earnings. The communiqué called for rescheduling restructuring operations to take account of natural disasters and other exogenous developments, in the wake of the Mexico City earthquake on 19 September 1985. Also required was an IMF facility to compensate for increases in interest rates; new credits from official export credit agencies for developing countries which had had their debts rescheduled, or were in critical need; Multi-Year Rescheduling Arrangements (MYRA) not to be conditional on 'enhanced surveillance' by the IMF; and the establishment by the Development Committee of a Task Force to study debt. In addition, G24 ministers urged a doubling of the capital of the World Bank; an eighth replenishment of funds for the International Development Association (IDA VIII) which would help compensate for the inadequacy of IDA VII resources, and take into account the increased needs of developing countries; the extension of enlarged 'access' to IMF funds which had come under threat in 1985; an allocation of 15bn Special Drawing Rights (SDRs) by the end of 1985 and regular SDR allocations thereafter; and more special help for sub-Saharan Africa, including the granting of Trust Fund reflows on the same terms as the original loans from the Trust Fund. They expressed firm opposition to attempts to introduce macroeconomic conditionality for IDA loans, and to collaboration between the IMF and the World Bank in the use of the Trust Fund, which they feared would inevitably result in cross-conditions being attached to loans.

In a move welcomed by the Development Committee, the Interim Committee endorsed the proposal that repayments to the IMF Trust Fund be used to provide additional concessional balance-of-payments assistance, on terms similar to those applied to trust fund loans, to low-income countries also eligible for IDA loans. These

North-South Monitor

repayments would amount to approximately SDR 2.7bn over the period 1985–91 during which time China and India undertook not to use the facility, despite being eligible to do so. Loans from the fund were, however, to be conditional upon countries' efforts towards medium-term structural adjustment and growth. In pursuit of this adjustment, the Interim Committee advocated close collaboration between the IMF and the World Bank, 'while avoiding cross-conditionality'. Despite US pleas for a return to standard borrowing levels existing before the onset of the debt crisis in 1982, the Interim Committee decided to continue enlarged access to IMF funds for 1986, but with a small reduction in the amount countries could borrow above their quotas. No agreement could be reached on an allocation of SDRs in the period 1982–6. It was, however, decided that the IMF Executive Board should undertake a review of the role of the SDR as a matter of priority. Finally, the Interim Committee gave preliminary consideration to two reports, by the Group of 10²⁷ and by the Group of 24,²⁸ on the international monetary system. The reports were to be considered more fully at the Spring 1986 IMF and World Bank meetings, after they had been studied by the IMF Executive Board.

The Development Committee communiqué stated that 'the World Bank has an increasingly important role to play in restoring growth'. It gave its support both to an enhanced role for the Bank in assisting adjustment (designed to implement policies to 'promote efficiency and mobilise domestic savings'), and for a substantial expansion of the Bank's lending programme. 'The Bank should not be constrained by lack of capital or borrowing authority in meeting future demand', the ministers stated. Tentative endorsement of the possibility of an increase in the general capital of the World Bank, by the US Treasury Secretary, James Baker, represented a departure from previous US refusals to countenance such an expansion. Ministers expressed concern about the financial resource problems of sub-Saharan African countries, requesting a study on the subject from the World Bank. Finally, the Development Committee echoed the Interim Committee's concern over protectionism, welcoming progress towards preparations for a new GATT round.²⁹

In a separate meeting of deputies of the IDA, in Seoul, a decision was announced to begin negotiations for IDA VIII in Paris in January 1986, in an attempt to conclude them by next year's annual meetings. The US agreed in principle to an increase in funds from the industrialised countries to the IDA, despite its previous reluctance to contribute to IDA VII. Notwithstanding the opposition of G24, it insisted, however, on stricter lending conditions which included urging recipient countries to adopt market-oriented policies. No figure was publicly discussed for IDA VIII, though it was speculated that a sum of \$16bn could be considered, as against an IDA VII of \$10.3bn.

In a speech to the plenary conference which followed the committee meetings, Jacques de Larosière, the Director of the IMF, stressed the need for economic growth in indebted developing countries, to enable them to 'grow out of debt'. He set out three main conditions for the achievement of a growth rate of 4½–5 per cent in developing country debtors: a growth rate of around 3 per cent in the industrial world; adequate foreign finance; and economic adjustment policies in debtor countries such as a reduction in budget deficits, which would encourage investment. James Baker, unveiling his 'broad-based, integrated' approach to the debt problem, underlined the need to invite investment to debtor countries. In his first speech to the

North-South Monitor

joint conference since he succeeded Donald Regan as US Treasury Secretary, he described a programme for sustained growth, to operate within the context of the existing case-by-case approach, which would have 'three essential and mutually reinforcing elements':

- The adoption by principal debtor countries of comprehensive macro-economic and structural policies towards growth, balance-of-payments adjustment, and the reduction of inflation;
- The continuation of a central role for the IMF, combined with increased and more effective structural adjustment lending by multilateral development banks (MDBs), in support of market-oriented policies in debtor countries;
- Increased lending by private banks to enable major debtor countries to undertake adjustment programmes. A figure of US\$20bn in net new lending to fifteen of the largest debtors over the next three years was suggested.³⁰

In addition to extra financial flows from commercial banks, the plan involved a 50 per cent, or US\$3bn per year, rise in World Bank and Inter-American Development Bank lending to the fifteen principal debtors (from the current annual lending of \$6bn). It incorporated a supplementary fund from the World Bank, the US and other rich donors of \$5–6bn, and \$2.7bn from the IMF Trust Fund, for countries with a per capita income of less than \$550. This last proposal was a modification of Baker's initial suggestion for a joint IMF and World Bank fund of \$5.4bn for the least developed countries, particularly in Africa. The original plan was for money to come equally from both agencies, and be supplemented by commercial bank funds guaranteed by the World Bank, and jointly administered to countries undertaking adjustment. The plan, however, had met with opposition from developing countries, which feared a straining of the World Bank's assets, and cross-conditionality resulting from IMF/World Bank collaboration. Some industrialised countries had also opposed it, on the basis that the World Bank's guaranteeing of commercial loans would compromise its institutional integrity and jeopardise its high credit rating. Baker had finally withdrawn the proposal at a meeting of the Group of 5 (G5) on 5 October 1985,³¹ which had been called as a follow-up to the September 1985 G5 agreement on currency intervention to reduce the value of the dollar.³²

Reactions to the Baker plan were mixed. While the conceptual shift from austerity to economic growth in debtor countries was generally welcomed, there was concern among developing countries over the modest contribution expected of commercial banks—only a 2½ per cent annual lending increase over its current level of \$300bn. Both World Bank President, AW 'Tom' Clausen, and the IMF's Jacques de Larosière endorsed Baker's appeal for commercial bank lending, but it was not clear how private banks could be induced to lend even this amount of money, despite Baker's contention that it was in their interests to do so, provided the recipients were stimulating growth through adjustment policies. The shift in emphasis from the IMF to the World Bank was also generally seen as a salutary move as it would mean a change from short-term crisis lending to longer-term development. Fears were, however, expressed for the integrity of the World Bank as a development institution if its loans were to become increasingly conditional on political criteria, including the adoption by debtors of such policies as tax cuts, denationalisation and deregulation of prices and wages. If, on the other hand, World Bank loans were to remain too 'soft' in the eyes of some creditors, there was concern that the Bank could undermine

North-South Monitor

the authority of the IMF by lending money to countries which were not conforming to the IMF's strict conditionality. Scepticism concerning the proposal also arose on account both of US reluctance to commit itself unconditionally to an increase in the World Bank's capital, and of unease over US macro-economic policy. A further reduction in the dollar, lower interest rates and a curbing of protectionism were all seen by developing countries, as well as by European representatives, as vital to an improvement in the world economy.

The unveiling of the new approach did nothing to soften the Peruvian position on the international monetary system.

The Peruvian Prime Minister, Luis Alva Castro, launched a scathing attack on the IMF, accusing it of being a political institution perpetuating colonialism, and constraining the national sovereignty of debtor countries. He reiterated an earlier threat made by President Alan García at the United Nations General Assembly to withdraw from the IMF; reaffirmed Peru's policy of confining debt service repayments to ten per cent of Peru's export revenues; affirmed Peru's decision to negotiate with its creditors outside the framework of the IMF; and called for a special UN Conference for the reform of the international monetary order, and the creation of a new international currency. Baker made it clear that maverick countries such as Peru would not benefit from his proposals. Other Latin American debtors, particularly Mexico and Brazil, were reported to have dissociated themselves from the Peruvian position.³³

A formal decision was taken at the meeting to establish a Multilateral Investment Guarantee Agency (MIGA), subject to the enrolment of five developed and fifteen developing countries, and their total contributions of \$360m. It is designed to boost investment flows into developing countries by guaranteeing direct investments (plants and plant loans, not portfolio investments) against non-commercial risks such as war; government expropriation; blocks on the transfer of currency, for repatriation; or breach of contract without effective recourse, all previously inadequately covered by bilateral treaties or national agencies. The creation of MIGA had long been opposed by developing countries, notably Brazil and Mexico, for fear of its giving an unfair advantage to foreign competition over local companies.

At the meeting, Tom Clausen announced his intention to leave office as President of the World Bank, at the end of his five-year term in June 1986.³⁴

● If developing countries implement growth-oriented reform; if the commercial banks provide adequate increases in net new lending to good performers; and if increased demand for quality World Bank lending demonstrates the need for increased capital resources, we would be prepared to look seriously at the timing and scope of a general capital increase.' James Baker, US Treasury Secretary. *Sunday Times* (London) 13 October 1985

'If the banks participate in this it will be because they find it is in their self-interest . . . They've got loans in trouble. It's like any other workout situation. It's possible that reflows will make bad loans into good loans.' James Baker, at a hearing before the House of Representatives Banking Committee. *IHT* (Paris) 24 October 1985.

'More growth-oriented policies are possible in Latin America only if there are lower interest rates. This is an American task, not a European task.' Dr Onn Ruding, Dutch Finance Minister and Chairman of the Interim Committee. *Financial Times* (London) 9 October 1985.

North-South Monitor

'Clearly, the developing countries will not be able to expand their exports, reestablish their creditworthiness and diversify their output if they have to cope with protectionist policies of the industrial countries.' Mamoudou Touré, Senegalese Minister of Economy and Finance, and Chairman of the joint annual meeting. *Financial Times* (London) 9 October 1985.

'There should be an end to the era in which a single country imposes the conditions for the existence of the rest . . . We do not accept that a single country can be subject to no control whatsoever while the Third World is condemned to hunger for the sake of economic equilibrium.' Luis Alva Castro, Peru's Prime Minister, speaking against the US. *South* (London) November 1985.

COMMODITIES

▲ International Natural Rubber Organisation (INRO)

Council Meeting

Kuala Lumpur, 4-6 November 1985

■ The thirty-three members of the International Natural Rubber Agreement (INRA) considered the question of financing a contingency buffer stock of 150,000 tonnes when the existing INRO stockpile reaches 400,000 tonnes. The buffer stock, INRA's price-support mechanism, was already estimated to have reached 370,000-400,000 tonnes.

At the previous council meeting in August 1985,³⁵ the consumer countries had already agreed to finance extra stockpile purchases with cash. Producer countries on the other hand had requested the INRO buffer stock manager to consider raising funds through bank loans, using his existing stockpile as collateral. A report by the INRO secretariat, however, indicated a firm preference on the part of banks for guarantees from member governments, rather than rubber stock warrants, to secure loans.

The Council agreed at its November meeting to finance the contingency stockpile with cash once it became necessary. Producing countries, including Malaysia (which had been under pressure from its smallholders to withdraw from INRA on the grounds that it favoured consumers' interests rather than Malaysia's)³⁶ agreed to this decision.

Consumer countries were also reported to have suggested an early resumption of talks on a second rubber agreement since INRA was to expire at the end of November and had merely been extended for another two years.³⁷

▲ Association of Tin Producing Countries (ATPC)

Annual Ministerial Meeting

Canberra, 17-18 September 1985

International Tin Council (ITC)

Fourteenth Session

London, 25-27 September 1985

■ Ministers of the six producer countries of the sixth International Tin Agreement

North-South Monitor

(ITA), namely Australia, Indonesia, Malaysia, Nigeria, Thailand and Zaire, met in their capacities as members of the ATPC. They agreed to make various recommendations to their respective governments prior to the ITC meeting with consumer countries which were designed to support the ITA in the face of falling tin prices.

The ITA regulates the price of tin by means of both export quotas and buffer stock management and currently has twenty-two members of which Canada, Japan, Spain, Switzerland and the EEC and Nordic countries are consumer countries. The ITC was in need of extra funds to allow its buffer-stock operations to continue, having made extensive tin purchases in order to keep prices above the ITA's floor price of £8,500 per tonne. Prices had been falling on account of a world oversupply of tin resulting from several factors: rising production and sales by non-ITC-member producers such as Brazil, China and Bolivia which together represented about 40 per cent of the market; low consumption levels; the high incidence of tin smuggling to evade ITA export controls and US sales from its General Service Administration (GSA) strategic stockpile of tin.

ATPC ministers agreed to recommend that their governments make 'significant and effective' cash contributions to the ITC. They agreed to approach non-ITC-member producers to try to secure production limitations and decided to press the US to reduce sales from the GSA stockpile. They also planned to intensify their efforts to prevent tin smuggling and to increase their budget allocation for research and development on new uses of tin, to encourage consumption.³⁸

The ITC decided to continue to restrict producers' sales to 60 per cent of their normal export quotas for the October-December 1985 quarter. The council also received a report from its preparatory committee which had been charged with preparing a seventh agreement when the sixth expires in 1987. Acting on the committee's recommendation, the Council deferred a negotiating conference for a new agreement from 13-31 January 1986 to 30 June-18 July 1986. The council also noted the ATPC's recommendations to its member governments and within a short time of the end of the session it was announced that producer countries had pledged £60m in additional funds for the buffer stock.³⁹

▲ International Tin Council (ITC)

Special Sessions

London, 29-30 October; 6-7 November; 14-15 November; 20 November and 2-20 December 1985

Fifteenth Session

London, 18-20 December 1985

■ The ITC began a number of full, emergency sessions following the cessation of buffer stock operations on 24 October 1985. These sessions all ended without a solution being found to the 'tin crisis', although a number of proposals were made by ITC members and ITC creditors.

After the price of tin had fallen to £8,140 a tonne, well below the ITA's floor price of £8,500 per tonne, Pieter de Koning, the ITA buffer stock manager, had announced

North-South Monitor

that he had run out of funds and was withdrawing ITA price support. When this occurred, the ITA's tin stockpile was 62,000 tonnes, and had cost £500m. These buffer stock purchases had been financed with £200m from ITA member-governments and about £300m in loans from fourteen banks and two other financial institutions which had accepted the existing stockpile as collateral. The ITC also had outstanding contracts with brokers to purchase more tin, which had to be fulfilled by 23 January 1986.

When the ITC announcement had been made, the London Metal Exchange (LME) had suspended tin trading indefinitely to prevent panic selling and a sudden fall in prices. Subsequent decisions were made by the LME to extend this suspension and it remained closed throughout the period of the emergency sessions. The second largest tin trading market in Kuala Lumpur also suspended trading and the US ceased sales from its General Service Administration (GSA) stockpile.

The ITC met to consider possible courses of action. With regard to finances, the options discussed were that extra funds could be injected by members into the ITC (particularly the £60m pledged by producer countries but not yet received) and ITA member-governments could pledge themselves to honouring the ITC's debts and to guarantee further bank borrowing. As for the ITA, the Council could decide to continue price support but at a reduced price level or gradually run down the ITC's stocks and cease operations.

At the first emergency session on 29–30 October 1985, it became apparent that producer countries, particularly Malaysia, were unwilling to pledge more funds unless consumers did so first and that consumer countries were anxious for the tin price to be lower and were equally unwilling to pledge more funds. A statement to the Council from the LME asserted that the ITC and its members were in default to LME members and appealed to ITC members to honour their debts.⁴⁰ Continued closure of the LME threatened, it said, to create secondary markets elsewhere which would supersede it entirely. In another move on 29 October 1985, the LME had attempted to restore confidence in the tin market by persuading its members with outstanding contracts with the ITC to pay £1,000 security deposits for each tonne of tin involved at a total cost of £50m. Notwithstanding these efforts, the first session ended without a decision on the debt issue.

Before the second meeting on 6–7 November 1985, two developments occurred. On 1 November 1985, the British government intervened in the tin crisis. Leon Brittan, the Trade and Industry Secretary, urged other members of the ITC to honour their debts outstanding on 24 October 1985 to banks and metal brokers and to enter into no new commitments. He also asked the ITC to reconvene earlier than its scheduled date of 12 November. Britain was apparently concerned about the future of the LME, which earns the country an estimated £200m annually in invisible earnings and about the future of London as a financial centre. Consequently, its government was understood to be willing to honour its own share of the ITC debt which amounted to roughly 4 per cent of the total.

Shortly after this intervention, the sixteen ITC creditors which had formed an informal emergency committee, announced their own proposal. They offered to defer repayments of principal on their £352m loans to the ITC and of interest due for twelve months. In return, they wanted producers to pay the £60m they had pledged in September and ITC member-governments to guarantee the ITC's outstanding

North-South Monitor

debts and provide sufficient cash to reactivate buffer stock operations in the future or to cease operations in an orderly manner, meeting all existing liabilities.

At the ITC meeting however only 'preliminary consideration' was given to this proposal and to a British proposal to set up a working group to consider ITC options, with no decisions being taken on the main issue of the debts. A split had emerged between Britain and other members of the EEC (particularly West Germany) who were reluctant to accept legal liability for ITC contracts. The EEC decided after a meeting in Brussels prior to the session, to conduct an independent audit on the extent of possible liability before making any commitments.

The third emergency session on 14-15 November 1985 considered a £900m refinancing proposal by thirty-five banks, including ITC creditors. The banks were offering to renew for twelve months the £352m loans on the existing stockpile and to commit a further £550m for three years to meet outstanding commitments to purchase tin from brokers. The deal was subject to various conditions: ITC member governments were to guarantee its debts; the ITC's operations, it was assumed, would be gradually dissolved; and creditors would hold a deposit in tin of 10 per cent of the value of their loans. The proposal was backed by threats of legal action both against the ITC and its member's governments. The session merely appointed an eight-member working group to consider the package, and Britain remained the only country willing to commit itself to guarantees. The working group also met with LME members to consider ways of organising a 'soft landing' for tin prices to prevent their sudden collapse when LME trading resumed on 18 November as it was scheduled to do. In the event, however, resumption of trading was further deferred with a final ultimatum for reopening set for 31 January 1986.

At the fourth emergency session, it was simply decided that the ITC would remain in session from 2 December 1985 until 'a definitive decision on resolving the tin crisis' had been reached. This continuous session began with separate meetings of consumer and producer countries in an effort to coordinate their positions. While the banks' proposal was considered too onerous, some form of 'burden sharing' between ITC-member governments, creditors and LME brokers was mooted as a possibility with hopes growing for a compromise on the part of those EEC members previously opposed to accepting government liability. A nine-member ITC working party received an informal offer from the LME to accept a negotiable 10 per cent loss in the process of reducing the ITA stockpile and discussed burden sharing with bank creditors, who had so far refused to accept less than 100 per cent repayment on their loans. Agreement was effectively prevented, however, by continued differences within the EEC. At a meeting in Brussels on 17 December, West Germany, France and Holland blocked agreement on the honouring of ITC debts, despite previous signs of a softening in their positions.

ITC producer countries suggested their own proposals for negotiating with creditors. These negotiations in their view would have to take place without prior commitments or admission of legal liability and with the intention of securing greater contributions from creditors and brokers than had previously been offered. These proposals received no support from consumer countries but an informal working party was set up to consider if they could be made acceptable to consumers. The emergency session was adjourned on 20 December 1985 until 14 January 1986 with the crisis still unresolved.

North-South Monitor

The fifteenth ordinary session running concurrently with the emergency session, decided to renew the export controls due to expire at the end of December for a further quarter.⁴¹

DISARMAMENT

▲ Soviet Union–United States

Arms Control Negotiations: Third Round

Geneva, 19 September–7 November 1985

■ The first and second rounds of bilateral talks on nuclear and space weapons, which began in March 1985, had ended in profound disagreement over the US Strategic Defense Initiative (SDI).⁴² While these differences persisted throughout the third round, both sides tabled formal, comprehensive proposals on arms control. Notwithstanding the confidentiality of the talks, substantive details emerged, through various public announcements, of the proposals. These moves were widely seen as having been inspired by a mutual 'propaganda offensive' preceding the Gorbachev–Reagan Summit in Geneva, in November 1985.

As the third round of talks began, President Reagan restated the US position on SDI, reaffirming that it was not negotiable, and would not be abandoned in a trade-off for deep cuts in Soviet and American nuclear forces. He also replied to remarks made by the Soviet leader, Mikhail Gorbachev, which had appeared to draw a distinction between permissible 'fundamental research' and other, impermissible elements of SDI, indicating a possible softening of the Soviet Union's hitherto implacable opposition to all aspects of 'Star Wars'.⁴³ President Reagan insisted that testing and development were themselves legitimate aspects of research on space weapons, and would not be halted, though he said that the US would consult both its allies and the Soviet Union before deploying weapons in space.⁴⁴ In a speech to the UN General Assembly on 24 September 1985, Eduard Shevardnadze, the Soviet Foreign Minister, in turn confirmed Soviet hostility to SDI on the grounds that if developed, it would afford a potential aggressor immunity from retaliatory strikes. He suggested a ban on the use of space for military purposes, and advocated multilateral cooperation towards 'Star Peace', or the development of outer space for peaceful purposes.⁴⁵ This proposal was later rejected by the US.

The comprehensive Soviet proposal was first made in a letter to President Reagan from Mikhail Gorbachev,⁴⁶ and formally tabled in Geneva on 30 September and 1 October 1985. It was then supplemented by offers made in a speech by Gorbachev in Paris on 3 October 1985, and by a later offer in Geneva in October. The proposal covered all three areas of the Geneva 'umbrella talks': intermediate-range nuclear forces (INF) in Europe; strategic weapons; and defensive and space weapons. While cuts in strategic arms remained conditional on the elimination of SDI, the proposal constituted a radical departure from the previous Soviet negotiating stance, of refusing to make any specific proposals for strategic or intermediate weapon cuts before the halting of SDI had been agreed upon.

The Soviet Union proposed a mutual cut of fifty per cent in strategic nuclear missile launchers (missiles and bombers), and a mutual ceiling of 6,000 on strategic

North-South Monitor

'nuclear charges'. A maximum of 60 per cent of these total nuclear charges could be contained on any one type of launcher in the strategic triad (land, sea or air). There would also be a ban on the deployment of new strategic weapon systems, and a freeze on cruise missiles with a range of over 600 kilometres. The proposal, however, defined 'strategic' to mean weapons capable of targeting the other superpower, and therefore included US long-range bombers, and the US intermediate-range weapons deployed in Western Europe, which were capable of striking the Soviet Union, but excluded Soviet intermediate weapons on the basis that they could strike only Europe, not the US. It remained conditional upon banning the testing, development and deployment of SDI weapons, outside the laboratory, with the possible exception of mutual laboratory research.

On INF, the Soviet proposal called for a mutual freeze on the deployment of intermediate-range nuclear missiles in Europe, to begin on 1 December 1985. It suggested the removal of all Pershing IIs in Europe, over the next eighteen months and a cut in Soviet SS20s until their total warhead count was equivalent to the number of warheads on the 100 remaining US medium-range cruise missiles, combined with the British and French independent nuclear forces. While in Paris, Mikhail Gorbachev had said that the Soviet Union had already frozen its SS20s in Europe, at a count of 243, and was phasing out its SS4s and SS5s. He had indicated the possibility of an agreement on INF separate from the negotiations on strategic and space weapons, and hence unconditional on the elimination of SDI. He had also proposed the possibility of a direct dialogue with Britain and France on their independent nuclear forces.⁴⁷ President Mitterrand had instantly rejected this suggestion, on the basis that France's nuclear forces were only marginally above the minimum required for credibility, and hence were not open for negotiation.⁴⁸ Britain had also rejected direct negotiation on its forces, though its approach to a separate 'dialogue' with the Soviet Union was more positive.⁴⁹

The US characterised the Soviet offer as a 'counter-proposal', since the original US offer, made at the Strategic Arms Reduction Talks (START) and INF talks in 1982-3, was still on the table. This offer had entailed a mutual ceiling of 5,000 warheads on strategic missiles, with a maximum of 50 per cent of these on land-based missiles. There was also a mutual ceiling of 400 on strategic bombers, though without a direct limit on the number of warheads they carried. The proposed INF ceiling was of 420 warheads world-wide, including the SS20s deployed in East Asia. Initial US public reactions to the Soviet 'counter-proposal' welcomed the fact that it had been made, but suggested that the details of the offer raised problems: it required the elimination of SDI, and was attempting to drive a wedge between the US and its West European allies, both by proposing separate talks, and by redefining 'strategic' to remove US missiles from Western Europe, while leaving Soviet missiles targetted against it.⁵⁰ The US Secretary of State, George Shultz, reportedly said later, however, that he saw 'four nuggets' in the Soviet offer: 'The 50 per cent cut in launchers (provided they were counted on a different basis); the 6,000 ceiling on nuclear charges (provided the figure included different charges); the separate INF agreement; and the 60 per cent ceiling on land-based nuclear charges, regarded by the US as the greatest Soviet threat. (This would mean a ceiling of 3,600 charges, and the US said it could compromise at 3,000.)'⁵¹

The US tabled its own new proposal on 1 November 1985, the last scheduled day of

North-South Monitor

the talks, before President Reagan proposed that they be extended for a further week, to allow time to discuss the US offer. US negotiators apparently proposed a mutual ceiling of 4,500 warheads on land and sea-launched strategic nuclear missiles, with a maximum of 3,000 being land-based. They suggested a ceiling of 350 on long-range bombers, carrying a maximum of 1,500 air-launched missiles, though without specifying limits to the number of warheads. Also proposed were bans on mobile long-range missiles, such as the SS24 and SS25, and the proposed US Midgetman missiles, and on the modernisation and deployment of new heavy missiles. On INF, they stipulated a mutual ceiling of 450 warheads, excluding the British and French independent nuclear forces, and a maximum of 140 intermediate-range missile launchers worldwide. All these provisions would be subject to stringent verification, and SDI development was to continue, on the basis that it was not violating the 1972 Anti-Ballistic Missile (ABM) Treaty, as the Soviet Union claimed. There would, though, be mutual access to each others' laboratories, and dialogue on the transition from offensive to defensive systems.⁵²

Also during the third round, the US reportedly rejected a Soviet offer to halt construction on the radar installation at Krasnoyarsk, Siberia, which the US claimed contravened the ABM Treaty. The offer was made conditional on the abandonment of US plans to modernise its radars at Fylingdales in Yorkshire, England, and at Thule in Greenland. A US spokesman said that the US radars referred to predated the ABM Treaty, and were not limited by it.⁵³

Notwithstanding informal US acceptance of the Soviet 50 per cent offer if differently handled, by President Reagan in his weekly radio address,⁵⁴ the Soviet negotiators maintained that SDI remained an absolute obstacle to agreement. The negotiations on the substance of the two sides' proposals were to commence during the fourth round of talks, due to begin on 16 January 1986.⁵⁵

● 'Their proposal is, as I suppose as you would expect as an opening proposal, a very one-sided and self-serving proposition.' George Shultz, US Secretary of State, discussing the new Soviet offer. *IHT* (Paris) 7 October 1985.

'It's as balanced as I'm standing on my feet . . . It covers all three areas of the discussions and it's well balanced.' Viktor Karpov, Soviet chief negotiator, when asked if the proposal was tilted in the Soviet favour. *IHT* (Paris) 2 October 1985.

'In so many words, it says that it's all right for the Soviet Union to threaten Europe, but it isn't all right for Europe to defend itself. In a nutshell, it requires the US to choose whether we defend our allies or ourselves, for in the limits they propose, you couldn't do both.' Robert McFarlane, US National Security Adviser, commenting on the new Soviet proposal. *The Times* (London) 8 October 1985.

'We are not pursuing a Metternich-like policy of 'balance of forces', of setting one state against another . . . but a policy of global détente . . . We are realists and we understand how strong are the ties—historical, political and economic—linking Western Europe and United States.' Mikhail Gorbachev, in a speech made during his state visit to France. *Financial Times* (London) 4 October 1985.

'I would characterise our arms control proposal as deep cuts, no first strike advantage, defensive research, and no cheating.' US President Ronald Reagan, on the new US offer. *ADIU Report* (Sussex) November-December 1985.

▲ Soviet Union--United States

Summit Meeting

Geneva, 19–20 November 1986

■ President Reagan and Mikhail Gorbachev met for the first summit between the leaders of the two superpowers since the Brezhnev–Carter meeting in Vienna, in 1977. The meeting, on which a temporary news blackout on matters of substance was imposed, was conducted on two levels. There were five hours of private talks between the two leaders, with only interpreters present, which prompted President Reagan to dub the encounter the ‘fireside summit’. There were also meetings between groups of Soviet and US experts, led by Soviet Foreign Minister, Eduard Shevardnadze, and US Secretary of State, George Shultz, in which a final joint statement was drafted. The summit itself was preceded by extensive diplomatic activity, both bilateral, and within the two alliance groupings.

A session in Helsinki between Eduard Shevardnadze and George Shultz, on 31 July 1985, was the first in a series of preparatory bilateral meetings. It was agreed then that the agenda would consist of three broad topics: international security issues; regional issues; and bilateral issues; with the US appending a possible fourth topic, human rights.⁵⁶ Meetings followed between Shultz and Shevardnadze in New York on 25 September 1985,⁵⁷ and on 28 October 1985;⁵⁸ between Reagan, Shultz and Shevardnadze in Washington DC on 27 September 1985;⁵⁹ and between Shultz, Gorbachev and Shevardnadze in Moscow on 4–5 November 1985.⁶⁰ There was a minimum level of agreement on the agenda, but also deep differences between the two sides, both in the relative importance attached to each issue, and in the overall purpose of the summit. The differences were so marked at the Moscow meeting in November (where the two sides reportedly proffered irreconcilable draft communiqués) that there was widespread doubt among officials of both sides that a final statement would be possible.

The Soviet Union apparently placed most emphasis on the subject of arms control, particularly the halting of the US’s SDI, and hoped that the summit would give substantial impetus to the Geneva arms talks on nuclear and space weapons. President Reagan, for his part, appeared to regard the summit as a means of establishing personal contact between the two leaders, and of reaching agreement on a broad plan of future action. He was also known to maintain his position on the non-negotiability of SDI,⁶¹ and to attach considerable importance to issues other than arms control. In addition to focusing on the perennial topic of alleged human rights violations in the Soviet Union, which had been mentioned by George Shultz at the Helsinki meeting, President Reagan had chosen the occasion of his speech to the fortieth anniversary session of the UN General Assembly to launch an initiative on regional problems.⁶² He had outlined a three-stage plan for curbing regional conflicts between the superpowers, signalling a possible revival of ‘linkage’ at the summit between progress in arms control talks, and the conduct of Soviet foreign policy throughout the world. The speech given subsequently by Eduard Shevardnadze to the UN highlighted differences between the two sides. It concentrated on arms control issues, and mentioned the Middle East and ‘Israeli and South African terrorism’, rather than the five key disputes on which President Reagan had focused: Afghanistan, Cambodia, Ethiopia, Angola and Nicaragua.⁶³

The final joint statement⁶⁴ indicated that a degree of movement had been made on

North-South Monitor

both sides. The undoubted focus was on international security, with only cursory reference being made to regional issues, and human rights. In its emphasis the statement therefore reflected the concerns of the US allies, who had advised President Reagan to concentrate on arms control. In addition to meetings of the Warsaw Pact and the North Atlantic Treaty Organisation which preceded the summit (see below), President Reagan had called a summit of his six key Western allies, in New York on 23–4 October. The leaders of the five countries represented (President Mitterrand of France declined the invitation) expressed support for the US approach to the summit. The British Prime Minister, Margaret Thatcher, however, seemed to have expressed satisfaction on the basis that the US would make a new arms control proposal before the summit, to match the Soviet offer of a 50 per cent cut in strategic launchers, which the Western leaders feared could make the US appear to be the intransigent power.⁶⁵

Despite this degree of movement in the US position, however, (a new US proposal was tabled in the Geneva arms talks on 1 November 1985—see above) the Soviet Union also appeared to have compromised on a number of issues. There was no mention of SDI; no explicit undertaking by the US to continue to comply with the Strategic Arms Limitation Treaty (SALT II) (signed in 1979 and never ratified by the US, but ostensibly adhered to by both sides) which was due to expire on 31 December 1985;⁶⁶ no renewed public commitment to upholding the 1972 Anti-Ballistic Missile (ABM) Treaty; and no US answer to the renewed Soviet offer that the unilateral moratorium on nuclear testing, begun on 6 August 1985, would be extended beyond 1 January 1986 if the US matched it. This offer had been repeated by Mikhail Gorbachev in reply to a letter to the Soviet and US leaders from the leaders of the six countries of the Five Continent Peace Initiative. In their letter they had proposed a twelve-month nuclear test ban on the part of both superpowers.⁶⁷

The joint statement said that the discussions between the two sides had been 'frank and useful', but that 'serious differences remain on a number of critical issues'. A number of areas of agreement were recorded: on international security issues, the two countries 'agreed that a nuclear war cannot be won and must never be fought'. They also agreed 'not to seek to achieve military superiority'. They agreed to 'accelerate' the Geneva arms control negotiations, repeating their agreed purpose of preventing an arms race in space, and terminating it on earth, and cited areas of 'common ground' in the talks: the principle of 50 per cent mutual reduction in nuclear arms, 'appropriately applied'; and the idea of an interim Intermediate-range Nuclear Force (INF) agreement. The statement also stressed the need for effective verification. President Reagan later said that he had offered to establish a reciprocal programme of visits to laboratories performing SDI research. There was no record of a response from Gorbachev, but he reportedly agreed in principle to the opening of Soviet laboratories to inspection, provided that space weapons were banned.⁶⁸ Mikhail Gorbachev was also said to have refused a US offer to share SDI technology with the rest of the world, including the Soviet Union.⁶⁹ The leaders reaffirmed their commitment to the Nuclear Non-Proliferation Treaty (NPT) and to Article VI, obliging them to pursue arms limitation in good faith. They repeated that they were in favour of the general and complete prohibition of chemical weapons, agreeing to accelerate efforts to conclude a treaty on the subject. They also affirmed the importance of the Mutual and Balanced Force Reduction talks (MBFR) in Vienna.

'Stupid questions,' says an old proverb, 'get stupid answers.' The three books under review have the distinct advantage over many other recent books on Iran in that they do not dwell on such inane questions as 'Was the revolution inevitable?', 'Could the Shah have prevented the revolution if he had been a little more decisive?', 'Could he have prevented it if he had been a little more flexible?', 'Would the regime have survived if it had spent a little less on ultra-modern weapons and a little more on crowd-control equipment?', 'Could the Shah have been more foresighted if he had not been under chemotherapy?', 'Could he have saved his throne if the US had done this or that', 'Could the US have channelled the revolution into a more amiable course?' 'Can the US find a *modus vivendi* with Islamic fundamentalists?', and so on.

Instead of being sidetracked by such questions, these books focus to a considerable degree on the three most pertinent—and interrelated—problems raised by contemporary Iranian history: What were the fundamental causes of the revolution? Why did Islam become the dominant ideology of the revolution? and Why has the Islamic Republic managed to survive, despite the initial predictions that its demise was imminent? Their answers are surprisingly similar. All three books tend to favour—often implicitly rather than explicitly—the interpretation that the main cause of the revolution was the regime's alienation of the traditional middle class, especially of the bazaars and the clergy; that the revolution was Islamic precisely because this class viewed Islam as an important component of its everyday culture; and that the Islamic

North-South Monitor

also reported that an understanding had been reached at the summit that both SALT II and the ABM Treaty would be honoured 'on a reciprocal basis'.⁷⁵

● 'The mere fact that this meeting is being held to review major international issues and problems that cause concern to the Soviet and American people is in itself an important event. . . . I would be so bold, I think, as to state that despite the fact that there is as much weaponry in the world as before the meeting, the world is nevertheless a safer place.' Remarks made by Mikhail Gorbachev during and after the summit. *The Times* (London) 21 November 1985 and *Financial Times* (London) 22 November 1985.

'There is much that divides us, but I believe that the world breathes easier because we are here talking together. Our differences are serious but so is our commitment to improving understanding. . . . Real confidence in each other must be built on deeds, not simply words. . . . The real report card on Geneva will not come in for months or even years.' Remarks made by President Reagan during and after the summit. *The Times* (London) 21, 22 November 1985.

'It was just the kind of "get-acquainted" that we wanted. These two individuals took this over completely. It was very much their meeting, and I think the length of time and the intensity and the frankness and the scope of what was talked about between the two by the fireside went beyond anything I could have expected.' US Secretary of State, George Shultz, after the summit. *The Guardian* (London) 22 November 1985. 'We are prepared to engage in a radical reduction in nuclear arms provided that the door to the space race is kept tightly shut.' Mikhail Gorbachev, at his press conference following the meeting. *The Times* (London) 22 November 1985.

'The President feels as strongly as ever that the research programme is essential. He insists on that. There was no give on that at all.' George Shultz, restating the US position on SDI, after the summit. *The Guardian* (London) 22 November 1985

NORTH ATLANTIC TREATY ORGANISATION (NATO)

▲ Ministerial Council

Brussels, 15 October 1985

■ A special meeting of the Council was convened at the request of Léo Tindemans, the Belgian Foreign Minister. After consultations with the Dutch Foreign Minister, Hans van den Broek, he had written to George Shultz, US Secretary of State, proposing a NATO meeting in New York on 24 October 1985. The proposal followed resentment in Belgium and the Netherlands that President Reagan had chosen to invite the leaders of Canada, Britain, France, Japan, West Germany and Italy to a special Western summit in New York for consultations on the forthcoming Gorbachev-Reagan summit in Geneva in November, to the exclusion of other members of NATO.

These countries were apparently particularly aggrieved that the oversight had come on the eve of the Netherlands' decision to approve the deployment of US cruise missiles and shortly after Belgium's decision to do so, both in the face of strong domestic opposition. The letter was understood to have emphasised that NATO was

North-South Monitor

the correct forum for consultations between the US and its allies on East-West issues.⁷⁶

Previous consultations between the US and its NATO allies on the US response to Soviet arms controls proposals tabled at the Geneva arms talks in October 1985, and on the superpower summit had taken place at the level of NATO ambassadors. After briefing them on 7 October 1985, Richard Perle, US Assistant Secretary of Defence for International Security Policy had reported that there was no pressure from NATO members for the US to change its negotiating stance following the Soviet offer of a mutual 50 per cent cut in strategic nuclear missile launchers.⁷⁷ At a subsequent briefing on 9 October 1985, Paul Nitze, Senior US Policy Adviser on Arms Control, reportedly told NATO ambassadors that the US was awaiting further substantive details of the Soviet offer before formulating a response. He did however express US misgivings about the offer as it stood: the 50 per cent cut applied to missile launchers and not to warheads; the Soviet definition of 'strategic' meant that the cut applied to US intercontinental and intermediate-range nuclear weapons but only to Soviet intercontinental missiles; and the Soviet position on space weapon research remained obscure.⁷⁸

The Ministerial Council meeting took place in Brussels after Shultz had offered to be present and was attended by ten of NATO's sixteen Foreign Ministers. Those absent included the British and French Ministers. The meeting endorsed Washington's caution towards the Soviet proposal but apparently urged the US to make a counter-proposal which would incorporate the positive elements of the Soviet offer, thus being seen by the European public to regain the initiative on arms control.

Ministers also welcomed assurances from George Shultz that despite the fact that the Anti-Ballistic Missile (ABM) Treaty was open to wide interpretation, the US Administration espoused a restrictive interpretation of it. These assurances followed widely-publicised remarks by the US National Security Adviser, Robert McFarlane, to the effect that the ABM Treaty placed limits only on the deployment of SDI weapons, not on their research, testing and development. These comments were contrary to the usual interpretation that the Treaty would limit both the testing and development of space weapons and were contradicted by Shultz who confirmed that the US would only consider research to be permissible under its terms.⁷⁹ Furthermore, Shultz told the Council that any move beyond the stage of research in SDI would be made only after consultations with US allies and negotiations with the Soviet Union.⁸⁰

● 'We are a loyal member of NATO . . . We want to be taken seriously'. Belgian Prime Minister Léo Tindemans in a telephone interview. *IHT* (Paris) 3 October 1985.

▲ Nuclear Planning Group (NPG)
Brussels, 29-30 October 1985

■ Defence Ministers from fourteen NATO countries met in closed session for their biannual review of the state of Western Europe's nuclear defences. The meeting was

North-South Monitor

also attended by US Defense Secretary Caspar Weinberger and Richard Perle, the Assistant Secretary.

The ministers endorsed proposals by General Bernard Rogers, the NATO Supreme Commander in Europe, for the modernisation of NATO's tactical or battlefield nuclear weapons. The 'Rogers Plan' had been presented to the previous NPG in March 1985, but a decision on it had been deferred.⁸¹ It sought to implement a decision of the NPG in Montebello, Canada in 1983 to reduce the NATO stockpile of short-range nuclear warheads by 1,400 by 1988 and to modernise the remaining 4,600 warheads from 1988-95. In effect, new tactical nuclear weapons were to be introduced (though not the enhanced radiation or neutron bomb) and two categories of obsolete weapons were to be removed: the Nike Hercules air defence system and the 300 remaining 'atomic demolition munitions' or atomic land-mines.

The NPG also reviewed current estimates of the size of Soviet nuclear forces, particularly the SS20s. Their estimated count of 441 SS20s was of crucial importance in that the Netherlands had undertaken to take a decision on 1 November 1985 to deploy US cruise missiles if the number of SS20s equalled or exceeded 378. Caspar Weinberger also presented the European Defence Ministers with US evidence of alleged Soviet violations of the ABM and SALT II Treaties. These violations were said to take the form of a Soviet radar at Krasnoyarsk in Siberia which the Soviet Union contended was for satellite tracking but which the US claimed contravened the ABM Treaty in that it was for detecting ballistic missiles; and the deployment of SS25s which the Soviets claimed was merely a modification of the SS13 and the US insisted was an entirely new system violating SALT II.

The US had been seeking European condemnation of these alleged treaty violations since the NPG meeting in Luxembourg in March 1985, but its NATO allies had remained non-committal on the subject. It was significant therefore that the final communiqué of the NPG condemned the 'steady build-up' of Soviet forces including the recently-deployed SS25s and conceded that these missiles constituted a new weapon. Furthermore, the communiqué expressed serious NATO concern over evidence of Soviet non-compliance with arms control agreements and reaffirmed the need for full compliance with existing treaties and for effective verification.

The NPG communiqué was widely seen as an attempt to submerge persistent differences of opinion between NATO members under a wave of united NATO support for the US position prior to the superpower summit. In addition to the decision on treaty non-compliance the communiqué expressed strong support for 'US positions covering intermediate, strategic and defensive and space systems'. The emergence of differences on SDI was precluded by its omission from the communiqué. The Soviet arms control proposal was characterised as one-sided and self-serving, in line with the US view, but hopes were expressed for an equitable and verifiable agreement. 'President Reagan', it was stated in the communiqué, 'goes to Geneva with the full support and solidarity of the Alliance'.

Following separate bilateral talks between Caspar Weinberger and Britain's Defence Secretary, Michael Heseltine, a draft Anglo-American Memorandum of Understanding on British participation in SDI was agreed after the meeting. The first accord to be reached since the US invited its NATO allies to participate in the programme in the spring of 1985, the understanding covered the conditions attached to the transfer of technology and the scale of British involvement in terms of

North-South Monitor

contracts and jobs. Despite Michael Heseltine's reported bid to secure contracts for Britain worth \$1.5bn, he obtained no written assurances on the value of the contract to be expected. The memorandum was to be submitted to President Reagan and Mrs Margaret Thatcher for approval.

The next meeting of the NPG will be held in West Germany in the Spring of 1986.⁸²

▲ Defence Planning Committee (DPC)

Brussels, 3 December 1985

■ NATO Defence Ministers, meeting for their regular autumn session of the DPC, endorsed plans for a conceptual military framework taking twenty years as the planning time-frame for operational concepts, forces and weapon systems. A final communiqué emphasised NATO's plans for improving its conventional forces in an attempt to minimise reliance on nuclear weapons in any future war.

The 1985 NATO Annual Defence Review was discussed in the committee and a 1986-90 NATO force plan adopted. The DPC also discussed ways of improving collaboration between NATO members in armaments production. Such cooperation had been strongly advocated in an informal meeting of the NATO European grouping prior to the DPC session. Defence Ministers of twelve European countries had cited the need for joint armaments ventures to minimise wasteful duplication of research and production within NATO and extract better value from defence budgets. A special meeting of NATO's deputy Defence Ministers on 15 November 1985, had proposed six specific weapons projects to be administered jointly with the US at an initial cost of \$400m.⁸³

The DPC reaffirmed NATO support for US efforts to secure arms control agreements with the Soviet Union. It expressed satisfaction that the deployment of US intermediate range missiles was proceeding according to the 'double track' decision of February 1979 by which 572 Pershing II and cruise missiles were to be deployed in five West European countries by the end of 1983, failing an agreement on intermediate-range nuclear forces (INF) with the Soviet Union.⁸⁴

Britain, France, Italy and Belgium had begun the deployment of these US missiles and congratulations were afforded to the Dutch government for its decision in November 1985 to deploy 48 cruise missiles. The Netherlands received harsh criticism however for its unilateral decision to abandon two of its nuclear tasks within NATO involving its air force when the missiles are deployed in 1988. (Two other tasks of the six nuclear ones assigned to the Netherlands were also being dropped in accordance with NATO's decision to reduce its nuclear warhead stockpile in Europe.) Among the most critical were the defence ministers of the other European countries which had deployed US missiles, who expressed concern that the Dutch decision to capitulate to anti-nuclear protests could encourage public pressure on other governments. The DPC appealed to the Dutch government to reconsider its decision but the Dutch Defence Minister, Jacob de Ruiter, was reported to have argued that without the decision to abandon two NATO tasks, the Dutch Parliament might not have agreed to the deployment of Cruise Missiles.

A further bilateral meeting between Caspar Weinberger and Michael Heseltine after the DPC session was reported to have brought the US and Britain closer to signing a memorandum of understanding on British participation in SDI.⁸⁵

North-South Monitor

▲ Annual Ministerial Council

Brussels, 12–13 December 1985

■ NATO Foreign Ministers issued an arms cooperation statement which called for the avoidance of wasteful duplication in armaments projects and for early collaboration between NATO members on research and development. The Council also requested the Conference of National Armaments Directors (CNAD) of the sixteen member-countries to move from the formulation of principles on arms cooperation to a study of specific projects to which the US was already reported to have allocated \$250m. US Secretary of State, George Shultz, warned however that the US might consider reducing its military assistance to Europe as part of an endeavour to lower its federal budget deficit.

The Ministers agreed that the Gorbachev–Reagan summit had laid the foundations for improved East–West relations. In their final communiqué, they said that the improved atmosphere in Geneva had vindicated the NATO stance of continuing with deployment of missiles in Western Europe, while conducting dialogue with the Soviet Union. The ministers of several European countries voiced concern however that substantial progress on arms control and particularly on intermediate-range nuclear forces should be made at the next superpower summit, due in 1986. Ministers also emphasised the importance of close consultation between the US and its NATO allies concerning East–West relations.

Apparently following French objections, there was no explicit mention of SDI in the communiqué, though support was expressed for the US position on arms control. The British Foreign Minister, Sir Geoffrey Howe, suggested however that the ABM Treaty should be strengthened and clarified. He advocated a restrictive interpretation of it which would preclude the development of SDI beyond the research stage. Hans-Dietrich Genscher, West Germany's Foreign Minister, also called for continuous monitoring of the effect of SDI on NATO strategy and cohesion.

George Shultz raised the issue of alleged Soviet non-compliance with arms control treaties and said that the US would continue to comply with the Strategic Arms Limitation Treaty (SALT II) 'on a reciprocal basis' until President Reagan had formulated a response to alleged Soviet violations. He also told the Council that the US would not accept the Soviet proposal to include the independent British and French nuclear forces in a count of intermediate-range nuclear missiles in Europe.²⁶

● Both sides are aware that they cannot conclude the next summit just like they ended the first one. There has to be more. . . . One cannot simply say for a second time that the atmosphere was good'. Hans-Dietrich Genscher, West Germany's Foreign Minister, *IHT* (Paris) 13 December 1985.

'We do not want a situation where the superpowers have super security while the lesser powers have lesser security'. Hans-Dietrich Genscher, West German Foreign Minister, on the need for monitoring the effects of SDI on NATO strategy, *The Guardian* (London) 13 December 1985.

'You asked us to act on the budget deficit and now we have done it. . . . You cannot have your cake and eat it'. George Shultz, commenting on European reactions to the prospect of cuts in the US defence budget, *The Guardian* (London) 14 December 1985.

North-South Monitor

Rajiv Gandhi, suggested that these should be comprehensive and mandatory sanctions. Prime Ministers Bob Hawke of Australia, Brian Mulroney of Canada and David Lange of New Zealand, whose countries had all recently applied punitive unilateral measures against Pretoria, advocated some form of united Commonwealth action, as did Prime Ministers Robert Mugabe of Zimbabwe and Mahathir Mohamad of Malaysia, and President Kaunda of Zambia. Pressure to this end was intensified during the meeting by the execution in South Africa of the poet, Benjamin Moloise, on whose behalf the Commonwealth leaders had made a joint appeal for clemency.

Even before the meeting began, however, it was apparent that economic sanctions were firmly opposed by the British Prime Minister, Margaret Thatcher. On 25 September 1985, Britain had belatedly announced its intention to apply the measures against South Africa decided by the EEC on 10 September 1985.⁹¹ There was some speculation that this concession might have been made in the hope that Britain's alignment with the rest of the European Community would strengthen its position against further sanctions in the Commonwealth context. Margaret Thatcher argued that sanctions would be counter-productive, as they would strengthen Afrikaner resistance to change, most harm the black population they were intended to assist, and destroy the neighbouring economies of Southern Africa.⁹² In a letter to the leaders of the six Southern African front-line states (Botswana, Lesotho, Malawi, Swaziland, Zambia and Zimbabwe—all Commonwealth members) she was reported to have emphasised the damage which South Africa could inflict on neighbouring economies in retaliation for sanctions.

The other Commonwealth leaders remained largely unconvinced by these arguments. Despite apparent impatience with the British position, however, they were anxious to avoid an open clash with Britain. There was a general recognition that as Britain was the largest foreign investor in South Africa and its fourth largest trading partner, the British government was acting out of perceived self-interest, and would be unlikely to retreat very far from its position. It was feared that a consequent breach on the subject of sanctions would not only have signalled the ineffectuality of the Commonwealth, but would effectively have lessened rather than intensified international pressure on South Africa. Accordingly, efforts were made to reach a compromise. Bob Hawke proposed the idea of a group of 'wise men' to represent the Commonwealth to the South African regime, in the hope of promoting a dialogue between Pretoria and other political groups. This idea became the basis for a 'twin-track' Commonwealth approach involving both dialogue and selective graduated sanctions. While Margaret Thatcher enthusiastically embraced the Hawke suggestion, her opposition to any form of sanctions apparently remained unsoftened by the persuasive efforts of the leaders of India, Canada, Australia and Zambia. Commodore Ebitu Ukiwe, the head of the Nigerian delegation, was also reported to have hinted at possible Nigerian retaliation for British intransigence, which would affect bilateral trade relations, investment and debt repayments. The deadlock was finally broken only when the British Prime Minister was informed of a decision to exclude her from an accord which most of the rest of the Commonwealth would formulate themselves. As a result of this ultimatum a final agreement was reached.

The Commonwealth Accord on Southern Africa contained three main elements:

North-South Monitor

- An appeal to Pretoria, formulated by President Kaunda, to take five steps towards the eventual 'eradication of apartheid and the establishment of majority rule on the basis of free and fair exercise of universal adult suffrage'. These were that the regime declare that the system of apartheid would be dismantled; terminate the existing state of emergency; immediately release Nelson Mandela and other political prisoners; lift the ban on political parties, including the African National Congress (ANC); and initiate a process of political dialogue. To this last step was added, reportedly at the insistence of the British Prime Minister, the phrase 'in the context of a suspension of violence on all sides'.⁹⁵

- A diplomatic initiative to encourage a process of political dialogue between Pretoria and 'the true representatives of the majority black population', involving a small group of 'eminent Commonwealth persons', and a time-table for reform. The group was to be chosen within a month by the leaders of seven countries: Zambia, Australia, Bahamas, Canada, India, Britain and Zimbabwe, together with the Commonwealth Secretary-General.⁹⁶ These same countries were also to determine whether progress had been made towards the prescribed goals within a time-limit of six months.

- The application of selective 'economic measures' against South Africa, with the threat of further voluntary steps if insufficient progress had been made after six months. The suggested programme of action for Commonwealth members entailed an affirmation of the UN Security Council mandatory arms embargo against South Africa, and of the Gleneagles Declaration on Sport. It suggested the adoption of nine core measures, proposed by Brian Mulroney, all but three of which were already being applied by Britain. The three new measures were bans on all new government loans to South Africa, on the import of Krugerrands and on government funding for trade missions to South Africa or for participation in exhibitions or trade fairs in South Africa. The further steps that the leaders said 'some of us' would consider after a period of six months included bans on air links, new investment, the import of South African agricultural products, government assistance for trade, and the promotion of tourism.

Bob Hawke suggested when the agreement was reached that he would request his cabinet to apply the more stringent measures immediately. By contrast, Margaret Thatcher made it clear that Britain would not be applying the follow-up measures in any circumstances, and that she regarded the concessions Britain had made towards the application of economic pressure as insignificant. Consequently, while the other leaders were apparently relieved that an accord had been reached, there was concern that its impact in Pretoria might be reduced, if not undermined, by these assurances from the British Prime Minister.

Continuing the subject of Southern Africa in their communiqué, the Commonwealth leaders condemned South Africa for its illegal 'interim administration' in Namibia, and for its attacks against neighbouring countries. They rejected attempts to delay Namibia's independence by linking it with the withdrawal of Cuban troops from Angola, and stressed that the US policy of 'constructive engagement' had failed. They also called for the immediate withdrawal of South African troops from Angola, and the ending of South African aid to dissident movements in Angola and Mozambique.

The communiqué expressed concern over drug-trafficking and international

North-South Monitor

terrorism, and implicitly criticised France for its policy in New Caledonia and its continuation of nuclear tests in the South Pacific. It also expressed their concern over growing protectionism and the international debt crisis, particularly in sub-Saharan Africa, calling for increased financial flows to indebted developing countries. The leaders endorsed a Commonwealth report on 'Vulnerability: Small States in a Global Society', and supported its recommendations that the UN make greater efforts to safeguard the security of these states, in the wake of the invasion of Grenada in 1983. Other subjects covered by the communiqué included disarmament; the situation in Southeast Asia, Central America, the Middle East and Afghanistan; and human rights. A separate document, the Nassau Declaration on World Order, affirmed Commonwealth support for the United Nations, deploring increasing moves away from multilateralism as an approach to world problems.

It was decided that the next CHOGM would be held in Canada in 1987.⁹⁷

● Britain is the odd one out . . . Even the US is coming round to sanctions. Europe is coming round to sanctions . . . It is not just a question of alone. It is a question of what we really stand for. What does Britain really stand for? Britain does stand for freedom, for human rights. Well, where is it? We don't see it on South Africa.' Rajiv Gandhi, Prime Minister of India, in an interview with *The Times* prior to the CHOGM. *The Times* (London) 11 October 1985.

It is 'an unfortunate fact that the attitude of the British government is determined to a very considerable extent by its perception of its economic interests, the very substantial British investment in South Africa . . . We are here dealing with issues which transcend a commercial balance-sheet.' Bob Hawke, Prime Minister of Australia, in a BBC interview prior to the CHOGM. *The Guardian* (London) 4 October 1985.

If sanctions 'can help destroy a despicable policy like apartheid, then sanctions must be applied by those who can hurt most, by the countries with the biggest economic clout. Failure to do so would mean hypocrisy on the part of those countries, and that will rub off on the Commonwealth.' Mahathir Mohamad, Prime Minister of Malaysia, in his opening address to the meeting. *West Africa* (London) 21 October 1985, p. 2230.

'I do not believe in economic sanctions. I do not believe that they will work. I do not believe in creating unemployment here only to create unemployment there.' Margaret Thatcher, Prime Minister of Britain, at the British Conservative Party Conference, prior to the CHOGM. *The Guardian* (London) 12 October 1985.

'Well, they have joined me now.' The British position had moved 'just a tiny little bit'. They were 'Tiny little measures . . . It was worth paying a price to get an agreement; it was worth paying a price to keep the Commonwealth together. . . . 'You would be right to conclude that I am not one of the "some".' Margaret Thatcher, when asked if Britain would contemplate the application of the further measures after a period of six months. *The Times* (London) 22 October 1985; *IHT* (Paris) 22 October 1985.

'We in the ANC were so shattered at the use Mrs Thatcher made of that compromise, disparaging something done in a good spirit. Talking about the new plan as a tiny, tiny bit made the other Commonwealth leaders look foolish . . . but much worse: she reassured Mr Botha by telling him he doesn't have to worry about the six-month deadline in the Commonwealth plan, because Britain will not agree to doing any

North-South Monitor

more when that deadline comes. So Mr Botha knows right now he doesn't have to change anything. Apartheid can stay.' Oliver Tambo, President of the African National Congress, who had been present in Nassau during the summit, speaking at a subsequent press conference in London. *The Guardian* (London) 28 October 1985.

▲ General Agreement on Tariffs and Trade (GATT)
Extraordinary Session of the Contracting Parties
Geneva, 30 September–2 October 1985

■ The special session of GATT's ninety members met at the request of the US with the support of sixty-five other contracting parties. The unusual procedure of convening a meeting by majority vote rather than by consensus, had been invoked at a session of the GATT Council in July 1985 as a means of breaking the deadlock on the establishment of a high-level preparatory meeting for a new round of multilateral trade negotiations (MTNs).⁹⁸ The special session confirmed that a 'preparatory process' on the proposed new round of MTNs had now been 'initiated' and agreed to further the process but only after a compromise had been reached on the agenda for the group.

The deadlock over the initiation of a new round of trade talks stemmed from the insistence of the US, supported by Japan, Canada and the EEC that trade in services be included in the talks and the reluctance of some developing countries led by India, Brazil, Argentina, Egypt and Yugoslavia to countenance its inclusion. These developing countries expressed fears both for their fledgling service industries in the face of competition from those in industrialised countries and for their national sovereignty, given that the trading of services generally requires establishments in other countries. There was, therefore, they argued, a vital distinction between trade in services and the movement of goods across borders with which all previous GATT rounds had been concerned. Furthermore, some developing countries expressed fears that they would be coerced into making concessions on services as a price for the implementation by industrialised countries of liberalised trade in goods to which they were already committed by the 1982 Work Programme. For these reasons, countries such as India and Brazil had been insisting both on the necessity of unanimity among GATT members in any decision on services and on the urgent need to enact the Work Programme agreed by the 1982 Ministerial Conference.

The conflict over services surfaced at the special session over the issue of the agenda for the preparatory group of senior officials which had yet to be established. Eventually a compromise was reached between the EEC and some developing countries with Brazil dissenting and India and Argentina tabling reservations. The group of senior officials, which would be open to all GATT contracting parties, was to examine the subject matter and modalities of the proposed new MTNs 'in the light of' the 1982 Work Programme and ministerial priorities for the 1980s and of 'the continuing consideration of changes in the trading environment so as to ensure that the GATT is responsive to these changes'. This wording was placatory both to those developing countries which wanted to limit the subject matter to issues contained in the 1982 Work Programme and to the US and other industrialised countries which

North-South Monitor

contended that GATT had failed to keep pace with structural changes such as the increasing significance of trade in services to their economies.

It was decided that the group of senior officials would meet first on 14 October 1985 and prepare a report for the annual meeting of the Contracting Parties in November 1985. The annual session would in turn take a decision on setting up a preparatory committee for a new GATT round. A decision on the inclusion of trade in services in the proposed round was therefore deferred.⁹¹

● 'We wanted an agenda which permitted anyone to raise any issue they wanted and we got one. . . . That means we can discuss services and we certainly intend to do so'. Michael B Smith, Deputy US Trade Representative, *IHT* (Paris) 2 October 1985.

'We do not accept that it is open to third countries to indicate what form these (banks) should take and how they should be regulated'. Mr Prem Kumar, India's Commerce Secretary, on the threat to national sovereignty posed by the inclusion of services in GATT rules, *Financial Times* (London) 2 October 1985.

'We have signed a truce. . . . I think it will be prolonged'. Paulo Nogueira Batista, Brazilian negotiator, *The Guardian* (London) 4 October 1985.

▲ General Agreement on Tariffs and Trade (GATT)

Forty-first session of the Contracting Parties

Geneva, 25-28 November 1985

■ Four hundred delegates from seventy of GATT's ninety contracting parties assembled for the annual session to take a decision on setting up a preparatory committee for a new round of multilateral trade negotiations (MTNs). There was no report from the group of senior officials established by the previous session as representatives of some seventy countries composing it had been unable to agree on a final document after four weeks of meetings.

Agreement on the report of senior officials was apparently blocked by Brazil, India, Argentina, Egypt and Malaysia, the five countries most strongly opposed to the inclusion in the talks of trade in services. They were reportedly insistent upon prior commitments from industrialised countries on four issues:

- 'standstill' or an undertaking from GATT members not to introduce any import restrictions conflicting with GATT rules;
- 'rollback' or the phasing out within a given period of existing restrictions on developing country imports which were inconsistent with GATT rules or based on waivers from them;
- 'safeguards' or the reform of the misused emergency measures taken by countries to protect industries threatened by imports 'as a result of unforeseen developments';
- 'preferential treatment' for the exports of developing countries to industrialised countries' markets.

It was also reported that there had been disagreement in the officials' group on the subject of trade in agricultural products. Developing countries, together with Australia and New Zealand, apparently complained about the high European subsidies on agricultural production, on the grounds that they were preventing

North-South Monitor

inroads into Western markets by their countries' products and obliging them to compete in other markets with 'dumped' EEC agricultural output.

The US response to the impasse in the group of senior officials was indicated in an address made by the US trade representative, Clayton Yeutter, to a US Senate Finance Committee hearing. He warned that if the deadlock on the new GATT round persisted, the US would begin negotiations with 'like-minded' trading partners outside the GATT framework. He also warned of US retaliation against countries thought by the US to be the most intransigent (namely Brazil, India, Argentina, Egypt, Yugoslavia and Nigeria) such as excluding them from the benefits of the Generalised System of Preferences.¹⁰⁰

Against the background of these warnings and the prediction of a growth in world trade of less than 3 per cent over this year's figure made by the GATT chairman, Felipe Jaramillo, the annual meeting reached a compromise. The agreement was based on an informal decision in a committee of six key participants consisting of the EEC, the US, Switzerland, South Korea, Brazil and India, to the effect that discussion on trade in services would continue within a committee set up in November 1984, under the chairmanship of Felipe Jaramillo. The plenary meeting agreed to the establishment of a preparatory committee to determine the objectives, subject matter and modalities to a new round of MTNs by mid-July 1986. It was to take into account the 1982 Work Programme as well as the views of the Group of Senior Officials. Its recommendations would then be presented to a full ministerial meeting in September 1986 which would formally launch the new round. It was accepted that any country not wishing to participate in the negotiations on services could withdraw from those discussions in the preparatory committee.

A parallel 'exchange of information' on trade in services would continue in the Jaramillo committee. A decision on the inclusion of services in the new round was therefore deferred until the September 1986 ministerial meeting. Though no explicit assurances were given to developing countries on the four other topics of concern, it was agreed that they would 'constitute important issues' in the Preparatory Committee.

Also at the meeting, Mexico made a formal application to join GATT. Park Kun, the Ambassador of South Korea, was chosen to succeed Felipe Jaramillo as chairman of the Council and Kazuo Chiba, the Japanese Ambassador, became chairman of the Contracting Parties.¹⁰¹

● 'We can't have nations accounting for 5 per cent of world trade dictating to those accounting for 95 per cent'. Dr Clayton Yeutter, US Trade Representative to the US Senate Finance Committee, *Financial Times* (London) 15 November 1985.

▲ General Agreement on Tariffs and Trade (GATT)

Textiles Committee Meeting

Geneva, 4 December 1985

■ Representatives of the forty-two state parties to the Multi-fibre Arrangement (MFA) met for their annual review of the agreement. They also continued discussions on whether or not to renew the Arrangement or to renegotiate a successor when it expires at the end of July 1986.¹⁰²

North-South Monitor

Many participants, including the EEC, China, Japan and low-cost textile producers, expressed harsh criticism of a decision by the US Congress on 3 December 1985 to approve the 'Jenkins Bill' restricting textile imports from twelve developing countries and regions while exempting Canada and the EEC from these restrictions. The Bill would also impose strict quotas on shoe imports. Speaking on behalf of the low-cost suppliers, John Yung Sun, the South Korean representative, pointed out that protectionist moves on the part of Congress were in stark contrast to attempts by GATT to liberalise trade.

The Committee was however assured by the US representative, Charles Carlisle, that President Reagan was almost certain to veto the passage of the Bill. At the same time he was reported to have defended US protectionist measures by saying that they were inspired by the belief that the recent growth in textile imports into the US was damaging its own textile and clothing manufacturers. Future negotiations, he said, would therefore have to resolve the problem of the excessive expansion of textile imports into the US.

Criticisms were also voiced by producer countries and particularly by Pakistan, Sri Lanka and South Korea, of Europe's expansion of exports into the US on the grounds that they had helped to stimulate the protectionist drive in Congress. The EEC in turn criticised Japan for failing to give greater access to its markets.

Few details of countries' positions on the future of the MFA were given beyond those already outlined at the July 1985 meeting. There were reports after the meeting, however, that the agreement was likely to be extended.¹⁰³

The Committee was to meet again on 3-4 April 1986.

▲ European Economic Community (EEC)—Gulf Cooperation Council (GCC) Ministerial Meeting Luxembourg, 14 October 1985

■ Foreign ministers of EEC and GCC countries met to consider the strengthening of cooperation between the two groups. The GCC (Bahrain, Kuwait, Qatar, Oman, Saudi Arabia and UAE) counts the EEC as its largest trading partner, and has over the past ten years become the third largest market for EEC products, but has no official contract-based economic relations with the European Community. This first joint ministerial-level meeting followed extensive informal talks on potential areas of cooperation.

The GCC delegation was led by Sheikh Sabah al-Ahmed al Jaber, Kuwait's Deputy Prime Minister and Foreign Minister, and Chairman of the GCC, together with the GCC Secretary-General, Abdullah Bishara. They argued that a future agreement between the two groups should reflect the status of GCC members as developing countries with free markets, for whom export facilities to the EEC were vital. The main concern of GCC countries was for duty-free access to the EEC for their petroleum products, which form 90 per cent of Gulf exports. While Gulf manufactures were duty-free under the Generalised System of Preferences, there were ceilings on petrochemicals, beyond which duties of 13.4-13.9 per cent were levied. The EEC delegation was led by Jacques Poos, Luxembourg's Foreign Affairs

North-South Monitor

Minister and President of the EEC Council, and by Claude Cheysson, EEC Commissioner for North-South Relations. They confirmed that a working party should meet before the end of 1985, to prepare for negotiations towards a joint agreement, but that there would be no preconditions on petrochemicals, or on any other issue.

A final communiqué issued after the two-hour meeting confirmed that a 'new and more active phase' of discussions between the two groups would begin, directed towards a 'comprehensive, mutually beneficial agreement to foster the broadest possible commercial and economic cooperation.' The areas of cooperation to be considered were trade, industry, investment, energy, technology transfer and training. The ministers called for a detailed examination of the issues involved in such an agreement. No negotiations took place during the meeting, which merely gave political impetus to further talks. The ministers were reported, however, to have agreed to establish a joint high-level group to study the problems associated with GCC petroleum exports to the EEC.¹⁰⁴

▲ European Economic Community (EEC)—Association of Southeast Asian Nations (ASEAN)
Joint Ministerial Meeting
Bangkok, 17–18 October 1985

■ The first-ever meeting of economic ministers from EEC and ASEAN countries was held to review economic and trade relations since the signing of the EEC-ASEAN Cooperation Agreement in 1980, and to promote further economic ties. It took place as a result of a long-standing request by ASEAN, and was a departure from the usual joint meetings of foreign ministers, initiated by the EEC. The conference was attended by 170 delegates, but these included only two economic ministers from the ten EEC countries,¹⁰⁵ as compared with fourteen ministers from the six ASEAN countries (Brunei, Indonesia, Malaysia, Philippines, Singapore and Thailand). The remaining European countries were represented by junior foreign ministers or officials.

In an opening speech, General Prem Tinsulanond, the Prime Minister of Thailand, advocated an expansion of the five-year cooperation agreement into such fields as investment, science and technology, the development of human resources, tourism and control of drug-trafficking. He called for greater urgency on the part of EEC countries in realising the potential of ASEAN's prosperous markets, in which they held a share of only 13 per cent, compared with the US's 17 per cent, and Japan's 38 per cent. While EEC figures showed that EEC-ASEAN trade had risen by 60 per cent since the signing of the agreement in 1980, the EEC's percentage share of the southeast Asian market was falling, on account of declining new European investment in the region. ASEAN countries were united in calling for more liberal European trade and investment policies, to allow the EEC to compete in their markets and increase the flow of investment into the region. ASEAN countries also advocated the presence in Southeast Asia of the European Investment Bank (EIB), the EEC's development bank. Claude Cheysson, the EEC Commissioner for North-South Relations, argued on behalf of EEC countries that each ASEAN

North-South Monitor

country should appoint an Ombudsman, to give advice to potential investors and assist them in tackling the maze of bureaucratic procedures which ASEAN representatives acknowledged was often a hindrance to foreign investment. He also reported that an involvement in ASEAN countries was beyond the present mandate of the EIB, but that the bank's statutes could be altered, given the political will to do so on the part of EEC members.

A final communiqué issued by the joint meeting said that the conference had decided to establish a 'top-level working party' to facilitate new investment in Southeast Asia. It was to report early in 1986, and would concentrate on ways of encouraging small and medium-size firms to invest in the region. No formal assurances were given by the EEC as regards involvement by the EIB, which was merely requested by the ASEAN countries to 'play a positive and constructive role on the basis of its financial expertise'. ASEAN countries hoped that such a role could lead towards public as well as private funding for joint projects in the region. EEC countries also hoped that the working group would identify precisely the bureaucratic obstacles to new investment with ASEAN.

ASEAN representatives also called for increased access to EEC markets for their goods, particularly primary commodities. The Malaysian Trade and Industry Minister, Tengku Razaleigh Hamzah, accused the EEC members, along with other industrialised countries, of having broken their pledges to roll back tariff and non-tariff barriers, and ASEAN called for the expansion of the Generalised System of Preferences to encourage ASEAN exports to the EEC. The communiqué recorded no formal assurances on these issues, merely stating that ASEAN welcomed the latest improvements in the EEC cumulative rules of origin, encouraging further trade. The communiqué confirmed a two-year extension of the 1980 Cooperation Agreement in its present form.

A greater degree of agreement between the two groupings was reported in discussions on the world economic situation, as opposed to issues of bilateral trade and investment. Both the EEC and ASEAN appeared to agree on the need to reductions in the US domestic budget deficit, and in interest rates, as well as in the Japanese trade surplus, in order to correct structural imbalances in the global economy. They also agreed in welcoming the start in 1986 of a new round of multilateral trade negotiations, as a move towards curbing protectionism.

The communiqué also registered the importance attached by the ministers to encouraging the development of local technical expertise; the potential of further links in scientific research activities; the creation of a joint centre for energy management training; and the possibility of EEC-ASEAN cooperation on tourism and on control of drug trafficking and abuse. No plans were indicated, however, for further joint meeting of economic ministers.¹⁰⁶

●Europe's 'needed greater sense of urgency is still sadly lacking'. General Prem Tinsulanond, Prime Minister of Thailand, commenting on the EEC's failure to increase its investment in ASEAN. *Financial Times* (London) 18 October 1985. 'The European governments are deaf.' Claude Cheysson, EEC Commissioner for North-South Relations, on the unwillingness of EEC member countries to extend the EIB's role into Southeast Asia. *Financial Times* (London) 18 October 1985. 'We've been flirting and now we've got engaged. It will take some time to get married

North-South Monitor

nd have children.' Tengku Razaleigh Hamzah, Trade and Industry Minister of Malaysia, commenting on the insubstantial results of the meeting. *Financial Times* (London) 19 October 1985.

**▲European Economic Community (EEC)—Contadora Group—Central American Common Market (CACM)
Joint Ministerial Conference
Luxembourg, 11–12 November 1985**

■Foreign ministers from the EEC (including Spain and Portugal, due to join the EEC on 1 January 1986), the CACM (Costa Rica, El Salvador, Guatemala, Honduras and Nicaragua) and the Contadora Group (Colombia, Mexico, Panama and Venezuela) met to strengthen economic ties between the two regions, and to end support to the peace process in Central America. An EEC-CACM Cooperation Agreement was signed, but the meeting was marked by dissension both within the EEC and amongst the Central American countries, over Nicaragua.

EEC ministers met separately, before the conference, to try to reconcile their differences over the tying of financial aid to conditions involving democracy and human rights. The positions of West Germany and France on this issue appeared to reflect differing approaches to the Nicaraguan state of emergency, which had been declared on 16 October 1985.¹⁰⁷ The West German representative advocated a linkage between the granting of funds for development, and a statement calling on governments in Central America to safeguard human rights and democratic liberties. The French representative, on the other hand, took the view that the cooperation agreement, as an inter-regional arrangement, should not discriminate between different countries in Central America in its assurances of aid. Honduras, meanwhile, took exception to the inclusion of Nicaragua in the agreement, criticising it for its refusal to reduce its armed forces in line with proposals contained in the draft Contadora peace treaty. The Nicaraguan Foreign Minister, Father Miguel d'Escoto Brockmann, argued, however, that the level of Nicaragua's military defences was a necessary safeguard against the threat of US aggression.

The five-year Cooperation Agreement was signed by the Central American foreign ministers including Panama, together with the EEC Council President and Acting President of the Conference, Jacques Poos, and the EEC Commissioner for North-South Relations, Claude Cheysson. It proclaims the desire of the signatories to establish a new structure of economic and political relations between the EEC and the CACM, institutionalising the political dialogue within the context of the Contadora Group's peace efforts, which was begun at the first conference in San José, Costa Rica, in 1984.¹⁰⁸ It commits the EEC to give economic, commercial and development assistance to the Central American countries, granting them 'most favoured nation' status in trade, and increasing aid substantially from its current level of \$35m per annum. The issue of linkage between aid and human and democratic rights was subordinated to an emphasis on promoting regional peace and integration, and was relegated to a series of statements in the annex to the cooperation agreement. The agreement also aims to expand cooperation between the two regions in industry, science and technology.

North-South Monitor

In a political communiqué issued after the conference, the twenty-one ministers stated their conviction that economic cooperation and political dialogue could contribute towards peace and stability in Central America. The EEC Ministers renewed their commitment to the Contadora Group's efforts towards this end, and, in a clear reference to the US, it was stated that all countries with interests in or links with the region should contribute to a restoration of peace. In a separate final economic communiqué, the ten EEC countries and Spain and Portugal agreed to grant priority to Central American countries in their aid. The Central American countries in their turn requested improved access to EEC products, and more stable prices.

The ministers decided to hold annual meetings, and it was announced that the next EEC-Contadora-CACM ministerial conference would be held in Guatemala, in 1986.¹⁰⁹

▲ Conference of France and African States

Twelfth Summit Meeting

Paris, 11-13 December 1985

■ Thirty-five African countries were represented at the annual informal conference, held alternately in France and Africa. Seventeen African heads of state were present, and about half of the participating countries were francophone.¹¹⁰ Of the thirty-seven states invited by France (nine fewer than the previous year) only Burkina Faso and Sierra Leone declined to attend. Those attending for the first time included nine Southern African frontline states, which had previously attended only as observers, and King Hassan II of Morocco, who had formerly sent Morocco's Foreign Minister as an observer.

The economic situation in Africa, and particularly the continent's estimated \$150bn foreign debt, occupied much of the summit's attention. In his opening speech, President Mitterrand of France listed three basic conditions for economic recovery in Africa: a readjustment of the world monetary system, entailing a lowering of interest rates and increased stability in foreign exchange rates; opposition to protectionism; and international support in the form of increased public and private financial aid to Africa. President Mitterrand reaffirmed France's pledge to devote an increased percentage of its gross national product to African development aid. He also lent cautious support, at a final press conference, to a proposal by President Abdou Diouf of Senegal, the OAU Chairman, for a UN-sponsored international conference on the critical economic situation in Africa. (France was thought to be hesitant to abandon the case-by-case approach to Third World debt, advocated by creditor countries, by supporting such a conference.) Citing the need for increased food production and self-sufficiency, President Mitterrand also advocated African self-help and regional cooperation in line with the programme approved by the OAU Addis Ababa summit in July 1985.¹¹¹ Ways in which to combat desertification were also reported to have been discussed at the summit.

On Chad, a perennial focus for Franco-African summits, President Mitterrand

North-South Monitor

• suggested that no foreign troops should be stationed there, and that France was not prepared to play the role of 'gendarme in Africa' by sending its troops there. He said, however, that France would never consent to the division of Chad, and insisted that a solution lay only in its unity. Following predictions by President Hissene Habré of Chad of an imminent Libyan offensive, President Mitterrand warned Libya against moving its occupying forces south of the fourteenth parallel. President Diouf had also apparently reported at a closed summit session that Colonel Gaddafi of Libya had suggested that Libyan troops in Chad be transformed into a peace-keeping force and extended throughout the country.¹¹² President Habré had expressed a willingness to meet Colonel Gaddafi on neutral territory, and there was speculation that King Hassan of Morocco who had bilateral meetings with Hissene Habré, was in a favourable position to act as a possible mediator between the two. There was some speculation that it was this prospect of mediation which prevented some African representatives from protesting against the presence at the summit of Morocco, which had left the OAU in November 1984, in protest at the admission of the Saharan Arab Democratic Republic (SADR).¹¹³

The presence of the frontline states, some of them Commonwealth countries, was indicative of the importance attached by France to the issue of Southern Africa. At his press conference, President Mitterrand said that France would continue its sanctions against Pretoria until apartheid had been eliminated, and that a 'general accord' had been reached at the summit on ways of accentuating efforts to lead South Africa towards a better understanding of equality and human rights. He also welcomed another proposal by President Diouf for an international conference on Southern Africa, scheduled for June 1986, the tenth anniversary of the incidents at Soweto.

A decision was taken to initiate a summit of 'countries having the common use of French'. The first Francophone summit, as announced by President Mitterrand, was to be held in Paris on 17-19 February 1986. It was to be attended by forty states. Switzerland was the only major French-speaking country which declined to participate. Previous attempts to initiate such a summit had foundered over a dispute on the representation of Quebec, between the Québécois and the Federal Government of Canada, in Ottawa.

The next Franco-Africa summit was scheduled for 1986 in Lomé, Togo.¹¹⁴

• ● 'France will not permit the balance to be upset by a policy of aggression towards Chad.' President Mitterrand of France, warning Libya against moving its forces south. Quoted in *Xinhua News Agency*, 13 December 1985.

Ministerial Council: Second Special Session and Thirty-ninth Ordinary Session
Harare, 21-25 October 1985

• ■ The second special meeting on ACP cooperation was attended by only nineteen ministers of the sixty-six ACP countries.¹¹⁵

The Council approved the Harare Declaration on Intra-ACP Cooperation which called for self-reliance in national development and for the strengthening of regional

North-South Monitor

organisations within the ACP Group. It also stressed the need for close consultations between ACP countries in coordinating their positions within international forums.

An expert report on Intra-ACP Cooperation prepared for the meeting was dismissed as 'wishful thinking' by ACP Council President Imro Fong Poen of Suriname and rejected by the Council. Instead, the Harare Declaration noted six priority areas for cooperation which were intended to be more realistic objectives for the group: trade development and cooperation in production; transport; communications; development finance (including the possibility of setting up an ACP bank); technology and cultural cooperation. These priorities were to serve as guidelines for the Committee of Ambassadors which was charged with preparing a programme of action on intra-ACP cooperation for the next Council meeting in Bridgetown, Barbados in April 1986.

At the ordinary session of the Council, the situation in Southern Africa was discussed. The Council agreed to establish a special fund to assist liberation movements in South Africa, Namibia and the Frontline States. According to Zimbabwe's Acting Minister of Trade, Emmerson Munangagwa, ACP countries also decided to urge the EEC to provide aid for victims of apartheid.

The Council appointed Edwin Carrington of Trinidad and Tobago as the new ACP Secretary-General by consensus.¹¹⁶

▲ South Asian Regional Cooperation (SARC)

Fourth Meeting of Foreign Ministers

Dhaka, 5 December 1985

South Asian Association for Regional Cooperation (SAARC)

First Summit

Dhaka, 7-8 December 1985

■ Five years after it was first proposed by the late Bangladesh President, Ziaur Rahman, SAARC was formally launched by seven leaders, from Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan and Sri Lanka.¹¹⁷ Following preliminary meetings of the Standing Committee of Foreign Secretaries and of the SARC Foreign Ministers, the summit adopted the SAARC Charter¹¹⁸ institutionalising the South Asian programme for regional cooperation. The leaders also issued the 'Dhaka Declaration',¹¹⁹ affirming that the fundamental goal of SAARC was to accelerate economic and social development in member-countries through the best use of their human and material resources.

The Standing Committee of Foreign Secretaries met on 4 December 1985. It finalised the draft SAARC charter and endorsed the Bangladesh draft declaration to be presented for approval to the summit. It approved a schedule of SAARC activities for 1986 involving forty-two projects in nine existing areas of regional cooperation: agriculture, rural development, health and population, telecommunications, postal services, science and technology, transport, meteorology and sports, arts and culture.

It also agreed to widen the scope of the integrated programme of action, suggesting two more expert committees to study international terrorism and drug

North-South Monitor

trafficking and abuse. The Indian Foreign Secretary, Romesh Bhandar, suggested cooperation in energy and tourism and was reported to have been in favour of cooperation in trade. These suggestions were not taken up, however, and the other, smaller South Asian countries were known to be wary of being increasingly dominated by India's economy if trade were to be included. SAARC Foreign Ministers for their part endorsed the draft charter and declaration before they were submitted to the summit. The Foreign Secretaries also adopted a Nepali design for a SAARC emblem consisting of a green seven-leaved tree symbolising growth, fruition and shade.

The SAARC Charter, approved by the summit, included among the objectives of the association the promotion of the welfare of the peoples of South Asia and of collective self-reliance; the acceleration of economic, social, cultural and scientific collaboration and development and the strengthening of trust and cooperation on regional and international issues among themselves as well as with other developing countries. Three principles determined that this cooperation:

- should be based on sovereign equality, territorial integrity, political independence, non-interference in each others internal affairs and mutual benefit;
- should complement and not replace bilateral and multilateral cooperation;
- should not be inconsistent with these forms of cooperation.

Overtaking a recommendation of the preliminary meetings for biennial summits, the leaders decided that SAARC summits should preferably be once a year. The second one was arranged for November 1986 in New Delhi and the third for 1987 in Thimpu, Bhutan. A Council of Ministers consisting of the seven foreign ministers was to meet as often as necessary but at least biannually, to review progress and decide on new areas of cooperation. The Standing Committee of Foreign Secretaries was also to meet as often as necessary but at least annually. The leaders decided to establish a permanent SAARC secretariat and called upon their Foreign Ministers to consider the details, including Nepal's offer of a site in Kathmandu. Meanwhile it was agreed that Bangladesh would provide interim secretariat services and President Ershad of Bangladesh was elected as chairman of SAARC for the coming year. It was decided that financial contributions to SAARC would be voluntary and that if insufficient funds were received, 'external financing from appropriate sources' could be mobilised with the assent of the Standing Committee. The Charter proclaimed that all decisions were to be taken on the basis of unanimity and that 'bilateral and contentious issues' were to be excluded from SAARC's purview. This meant that notwithstanding a call by Sri Lanka's President, Junius Jayawardene, for India to take the lead in SAARC,¹²⁰ each member-country was in effect granted a veto by the Charter. The Indian Prime Minister, Rajiv Gandhi, also stressed that SAARC was based on the sovereign equality of its members.

The Dhaka Declaration acknowledged that the South Asian peoples who constitute one-fifth of the world's population were faced with problems of poverty, economic backwardness, low productivity, unemployment, over-population and other legacies of past exploitation. It advocated increased 'people-to-people contacts' at various levels as well as regional cooperation while reaffirming SAARC's commitment to the principles of the UN Charter and to the Non-Aligned Movement. Peace and security were seen as 'an essential prerequisite' for the realisation of SAARC's objectives and alarm was expressed at the 'unprecedented

North-South Monitor

escalation' of the arms race, particularly at its nuclear aspects which 'violated the principles of the UN Charter'. The leaders called for urgent negotiations among nuclear weapon states for a Comprehensive Test Ban Treaty and expressed hopes that the forthcoming Geneva superpower summit would lead to greater global security. Deep concern was expressed at the global economic crisis, the effects of which had been compounded by natural disasters—President Ershad had cited the Urr Char cyclone disaster in Bangladesh in his speech—and by the absence of world food security. The leaders regretted the weakening of multilateral cooperation and called for a renewed commitment to the International Development Strategy and to the Substantial New Programme of Action for the least-developed countries. They also called for the urgent resumption of the North-South dialogue and for the early convening of an international conference on money and finance for development.

The summit took further decisions to hold two ministerial-level meetings. One, the suggestion of Pakistan's President Zia ul-Haq, was to plan a Programme of Action concerning the role of women in regional activities and was to be held in New Delhi. The other, to be hosted by Pakistan, was to concert member-countries' approaches to multilateral negotiations such as those within GATT and for a New International Economic Order. The leaders also approved a joint package of airline fares for the region.

True to the dictates of the SAARC Charter which sought to delineate the areas on which regional cooperation was possible, bilateral and contentious issues were largely excluded from the summit's deliberations. Notwithstanding the endorsement of a decision to establish a committee on terrorism as it affects the security and stability of their countries, there was reported to have been no discussion of India's accusation that Pakistan was aiding Sikh terrorists in the Punjab or Sri Lanka's accusation that India was harbouring Tamil separatist guerrillas in Tamil Nadu.

Some references were made to regional disputes in the leaders' speeches.¹²¹ King Jigme Singye Wangchuk of Bhutan claimed that it was unrealistic to attempt to limit discussion to non-political issues and advocated dialogue between India and Pakistan on preventing the development of nuclear weapons. President Zia ul-Haq spoke of the need to divert finance from military spending to development and advocated the collective renunciation of the threat or use of force against each other and the banning of nuclear weapons. Despite a brief bilateral discussion between President Zia and India's Prime Minister Rajiv Gandhi, there was no formal reference to the dispute between India and Pakistan on the development of nuclear weapons. President Ershad reported that though regional trade was not yet encompassed by SAARC, it had been discussed at the summit and would eventually be included.¹²²

● India, the largest every way, larger than all of us put together combined, can by deeds and words create the confidence among us so necessary to make a beginning. . . . He (Rajiv Gandhi) should tell us what each of us should do and we should respond as best as we can.' Sri Lanka's President Junius Richard Jayawardene to the summit, *BBC Summary of World Broadcasts*, FE/8130/A3/6, 10 December 1985.

'That's precisely what we don't want to do. We will operate by consensus, in concert and no one will carry any more weight or less than any other.' India's Prime Minister Rajiv Gandhi, disclaiming any desire to tell the others what to do, *The Times* (London) 11 December 1985.

North-South Monitor

'Through SAARC we hope to convince India that it must take measures to play its part as the centre figure in South Asia but with the recognition that there is nobody big or small. They are all equal independent autonomous states. India must also realise that it is the smaller states which have the greater ego. It won't cost India to play a low profile and generate confidence in others. Let India buy something from smaller countries. And only in this way we can live in peaceful coexistence.' Pakistan's President Zia ul-Haq in an interview with the *Bangladesh Observer*. *The Hindu* (Madras) 7 December 1985.

'It may neither be possible nor desirable to limit discussions in our meetings to issues of a non-political nature for the political climate of our region will undoubtedly cast a long shadow over our deliberations.' King Jigme Singye Wangchuk of Bhutan to the summit. *Summary of World Broadcasts* FE/8130/A3/7, 10 December 1985.

▲ Gulf Cooperation Council (GCC)
Fourth Meeting of Defence Ministers
Kuwait, 20-21 October 1985

■ Defence Ministers or Chiefs of General Staff of the six GCC countries (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia and the UAE) met to review military cooperation. They considered proposals made by the GCC Chiefs of Staff at their fifth meeting in Riyadh on 7-8 October 1985.¹²³

According to a final statement,¹²⁴ ministers approved a joint defence strategy which was said to be based on the principle of self-reliance. No details of the strategy were given in the statement but some indications were provided in a subsequent press statement by the Kuwaiti Chief of General Staff, Major-General Abdullah Farraj al-Ghanim. He was reported to have disclosed a decision by ministers to establish a joint air defence radar system, following comprehensive study by member-states. He said that GCC states had made preparations in case the Strait of Hormuz was closed and they would demand that as an international sea-lane it should be re-opened. He also reported discussions on the setting up of a unified general staff for the GCC, and on ways of standardising training and the weaponry of member states.¹²⁵ The joint defence strategy was to be presented to the GCC summit in Muscat in November 1985 for approval.

According to the statement, ministers reviewed steps taken to complete the formation of the Peninsula Shield Forces, the GCC Rapid Deployment Force consisting of two brigades stationed in Hafr al Battin in north-east Saudi Arabia. This force had been established at the fifth GCC summit in Kuwait in 1984 and was hailed by ministers as a symbol of cohesion and a manifestation of the principle of self-reliance.¹²⁶

▲ GCC
Meeting of Foreign Ministers
Muscat, Oman, 29-30 October 1985

Sixth Summit
Muscat, Oman, 3-6 November 1985

■ The major concern at the Muscat summit which was attended by the rulers of all

North-South Monitor

six GCC states, was the security and stability of the Gulf region, given the escalation of the Iran-Iraq War and of terrorism.

At the preceding meeting, Foreign Ministers had agreed to recommend to the summit the adoption of the joint defence strategy which had been proposed by GCC Defence Ministers. According to a statement by Omani Foreign Minister Yousef Bin al-Alawi Abdullah, they had also agreed on the importance of joint action to achieve peace in the region through negotiations with the parties to the Gulf War. Significantly, and unlike previous communiqués of the Foreign Ministers, the statement made no criticism of Iran's role in the war. Yousef Bin al-Alawi Abdullah stressed the need to find solutions which would pacify both Iran and Iraq.¹²⁷

The final summit communiqué reported that the leaders had discussed the Iran-Iraq War in the light of its 'serious escalation—particularly in the Gulf waters'. This was understood as a reference to recent Iraqi attacks on Iranian oil installations, particularly on Kharg Island, and to the retaliatory interception by Iran of third-country ships suspected of carrying military supplies to Iraq via the ports of GCC countries. These recent developments were said to pose a threat to the security and stability of the entire region and to freedom of navigation in the Gulf.

The summit called on Iran to respect the principles of freedom of navigation in international waterways and freedom of passage for merchant ships as set out in UN Security Council Resolutions 540 of 1983 and 552 of 1984. It affirmed the need to continue GCC mediation efforts to end the war while safeguarding the 'legitimate rights and interests of the two sides'. No new mediation effort was initiated but there was speculation that the summit marked a shift towards a more neutral GCC policy towards the war. The Omani Information Minister and summit spokesman, Abdul Aziz Bin Mohammed Al-Rowas, told a press conference that the leaders had discussed relations between the GCC and Iran and there was a move to activate a dialogue and improve relations with Iran.¹²⁸ The GCC Secretary-General, Abdullah Yaqub Bishara, also emphasised the GCC's policy of 'peaceful coexistence' according to which it would accuse neither side in the War.¹²⁹

The communiqué said that the summit had approved the strategic concept of defence cooperation among GCC countries and endorsed the goals of the security strategy. The Omani Deputy Prime Minister for Legal Affairs, Fahad-bin-Mahmouc al-Said, said that having approved the joint defence strategy, the leaders had instructed the authorities in each country to implement it.¹³⁰ No details were given but according to subsequent reports by the Kuwaiti Defence Minister, Salem Saba al-Sabah, the strategy's main tenets included the upgrading of members' defence capabilities and ensuring the region's food security. All the GCC countries with the exception of Saudi Arabia and Oman are heavily dependent on food imports.¹³¹

Reviewing the security situation in view of the 'escalation' of terrorism in the region, the leaders condemned all aspects of terrorism and expressed solidarity with any member-states subjected to terrorist acts. Such acts were considered a threat to all the GCC states on the basis that 'the security of the GCC countries is indivisible'. The communiqué also expressed support for the Palestine Liberation Organisation, condemning the recent Israeli attack on its head-quarters in Tunisia. It also stated the GCC's continuing support for the unity of the Lebanon and for its stability and independence. The leaders reviewed relations between Arab countries and expressed their satisfaction with the process of reconciliation through committ

North-South Monitor

initiated at the Arab League summit in Casablanca in August 1985.¹³²

Reviewing progress towards economic cooperation within the GCC, the summit agreed to draw up timetables for implementing previous protocols on a joint agricultural policy; a unified strategy for industrial development; educational goals and methods; and policies and general principles for protecting the environment. The Administrative Council was charged with the task of approving the timetables and studying the possibilities for cooperation in new areas of economic activity. On education, the leaders agreed that their countries would afford equal treatment in schools to students from other GCC countries and that they would give equal recognition to each others' educational certificates. No mention was made in the communiqué of other issues such as oil pricing, which was discussed by GCC Oil Ministers at their meeting in Riyadh on 21–22 October 1985¹³³ or border disputes within the GCC.

The seventh summit was scheduled for November 1986 in Abu Dhabi.¹³⁴

● 'We cannot allow a vacuum in our contacts with Iran and Iraq. . . . We are on the front-line of this conflict, and just because we have not achieved success in our mediation efforts before, this is no excuse to stop now'. Mr Abdullah Bishara, GCC Secretary-General, to a press conference following the summit. *Financial Times* (London) 7 November 1985.

▲ Organisation of Arab Petroleum Exporting Countries (OAPEC) 35th Ministerial Council Meeting Baghdad, 27 November 1985

■ Oil Ministers¹³⁵ or their representatives from ten OAPEC member-countries adopted a five-year Action Plan for 1985–1990 and approved a budget for OAPEC of \$9.3m for 1985/6.

The five-year plan of action was prepared by a ministerial committee consisting of Algeria, Bahrain, Kuwait, Tunisia and Saudi Arabia, set up for that purpose in November 1983. The programme is designed to improve the functioning of OAPEC by enhancing cooperation among its member-countries. The priorities for the five years were identified as research and development (including that in technical fields with other regional and international organisations and oil and energy-related programmes); the promotion of inter-Arab trade in petroleum products; and coordination among OAPEC's various joint ventures. Less emphasis was to be placed on the setting-up of new joint ventures in view of financial constraints facing member countries. New projects would be left to established companies to undertake commercially.¹³⁶

The next OAPEC Council of Ministers was scheduled for 6 May 1986 in Kuwait

North-South Monitor

▲ Organisation of Petroleum Exporting Countries (OPEC)
Market Monitoring Committee (MMC)
Geneva, 5 December 1985

Seventy-sixth Ministerial Conference
Geneva, 7-9 December 1985

■ The annual ministerial conference was attended by oil ministers from OPEC's thirteen member-states together with observers from the non-OPEC members, Mexico and Malaysia.

At the previous conference in October 1985, OPEC ministers had deferred a decision on increasing individual members' production quotas as some countries had then been demanding. They had not been prepared to increase the official production ceiling of 16m barrels a day (b/d).¹¹⁷ At the December meeting, the MMC reported that OPEC members' collective output had in fact increased to about 18m b/d but that the projected demand for OPEC's crude oil in the first quarter of 1986 was only 16.3m b/d.¹¹⁸ OPEC's share of the global energy market had been declining owing to the encroachment of energy conservation, the increasing substitution of alternative energy sources for oil, and increases in supply from non-OPEC oil producers such as Britain and Norway. However, at the December Conference, no OPEC members were willing to lower their production levels unilaterally in order to protect oil prices in the face of the anticipated fall in demand.

A communique issued by the oil ministers¹¹⁹ recorded their conclusions following consideration of the trends in the global oil market. They 'decided to secure and defend for OPEC a fair share in the world oil market consistent with the necessary income for member-countries' development'. This decision constituted a dramatic re-ordering of priorities for OPEC. It signalled that high production levels and the defence of its members' market share would for the time being take precedence over price maintenance which was normally achieved by production cut-backs. The communiqué reaffirmed all the conferences' previous resolutions, apparently as a concession to Algeria, Iran and Libya which still wished the defence of prices to be an objective for OPEC. While the current OPEC structure of official prices and its 16m b/d production ceiling were not formally altered, they were placed in temporary abeyance by the emphasis on maintaining and possibly retrieving OPEC's share of the oil market.

The meeting also signalled the beginning of more competitive prices for OPEC's oil. Though several of the ministers denied the intention of initiating an oil-price war, their decision to defend their market share constituted an inducement to non-OPEC oil producers to secure an agreement with OPEC in the interests of market stability. The Saudi Oil Minister, Sheikh Ahmed Zaki Yamani, remarked that in the absence of cooperation between all oil producers, prices would be likely to drop from \$28/barrel to \$20/b.

While it was not clear exactly what constituted a 'fair share' of the oil market, the conference decided to establish a special committee to examine ways in which such a share could be achieved and to make recommendations on pricing and production policy to an extraordinary ministerial conference to be held in February or March 1986. The committee was to be led by Arturo Hernandez Grisanti, Venezuela's Minister of Energy and Mines and the newly-elected President of OPEC, and

North-South Monitor

consisted of Indonesia, Iraq, Kuwait and the UAE. It was also asked to consider a Venezuelan suggestion for a new pricing strategy whereby OPEC prices would be indexed to spot-market prices for a basket of non-OPEC crude oils.¹⁴⁰

According to the conference communiqué, other resolutions were passed, reportedly on price and production agreements but it stated that these required ratification by the governments of member-states before being made public on 9 January 1986.

The next ordinary meeting of the ministerial conference was scheduled for 25 June 1986.¹⁴¹

● Lower oil prices don't serve anyone. With the present world economic crisis, it's in no one's interest to add to the existing disorder'. Belkacem Nabi, Algeria's Energy, Chemicals and Petrochemicals Minister, to the Press. *Middle East Economic Digest* (London) 14 December 1985.

'A fair share of the market is what you can get. Britain will not take my customers. Not a single one. If there is to be a price war we are prepared'. Professor Tam David-West, Nigeria's Oil Minister, *The Times* (London) 10 December 1985.

'This is the final chance for non-OPEC members. We have asked them to sit down with us to discuss the market before, but they have always refused'. Dr Mana Saeed Otaiba, UAE Oil Minister, *The Times* (London) 10 December 1985.
